Q. Was there any government assistance involved in this expansion?

A. No.

Q. None at all?

A. No.

Q. This is entirely on your own?

A. Entirely our own, yes.

[fol. 2048] Q. With respect to the construction since Korea by any of the other existing primary producers of your own knowledge, do you know whether there was any federal government assistance in their construction?

A. Yes. Since the end of Korea in the United States, we have on record in the industry that there has been some outside the United States parenthetically, but it is the Harvey Aluminum I believe that had government assistance. The Anaconda program had none, I believe. I don't think there was any in the case of the Olin-Mathieson. It was just in the Harvey that there was government assistance.

Q. How about the period between World War II and Korea, the period during World War II and subsequent to World War II up to 50 and 51, Alcoa I believe extended somewhat during that period?

A. Yes sir. The only real expansion in that period was the Korea program on the part of several producers.

Q. Was there some federal assistance involved directly or indirectly?

A. Only through the stockpiling arrangements. And of course in those days it was controlled materials. In other words the government gave priorities to control materials as it did to other facilities. But simply the stockpile arrangements that the government made in return. And I don't

know whether you call this government assistance or not. Because the industry at that time spent its own private capital and in return agreed to put aluminum in the govern-
[fol. 2049] ment's stock pile. Now you can decide whether that was a benefit or otherwise.

Q. Yes.

A. Sometimes we think it was otherwise.

Q. Did you receive an indication from the federal government what the purpose was, from their standpoint?

A. Yes. We were only allowed to build two plants. They specified exactly what capacity you could build and that was it.

Q. And their purpose was to build a stockpile for future war time emergency?

A. That is exactly the program. Rather than buying it abroad. Also to build up some competition for Alcoa.

Q. What do you mean by that?

A. Well actually the specifications as to the productive capacity that was allowed to be built by the respective companies was gauged on the basis of what the government decided our competitors could build and what we could build. And we were permitted to build a specific amount and the others were permitted to build some greater amounts.

Q. They were smaller than you at that time, of course?

A. Exactly. This was the government's decision.

Q. Now since World War II and particularly since Korea and during Korea I think you said there were times when there was some temporary shortages of aluminum and there was some government programs of allocating primary alu-
[fol. 2050] minum to non-integrated companies. You are generally familiar with that program?

A. Yes sir.

Q. I believe you spoke on direct that in some of those cases you used the historical method of allocating the short supply of aluminum to your customers. Could you very briefly tell me how that worked?

A. Yes. It obviously had to be somewhat arbitrary because there were no rules of the game that anybody, that any authority set up. Many companies did this same kind of thing because they had to. It was not just aluminum that was in short supply.

Speaking of the Korea period, it was largely passed Korea, subsequent to World War II and coming into Korea there was for a while an over-surplus of aluminum and there were never any real shortage periods there that were of significance. So it was past Korea that we ran into problems of allocation and just prior to Korea when we ran into problems of allocation when the government controls went on.

If for example in any particular area, if I recollect, and I am not sure I do the details of it, but certainly we had a definite record of the amount of tonnage that we shipped say over a period of five years. I believe it was a five year period that was chosen prior to this time. And that record would total up to a certain sum of aluminum produced by us and that was shipped, let's say to 100 customers and then [fol. 2051] allocated, and of course in the various products of ours you had a similar situation—so that we totalled the whole thing up and simply put a percentage on it, and that was the allocation in effect. That is the simplicity of it.

Q. And the word historical means based on what they produced in the plant——

A. Based on what they purchased in the past and on a percentage basis summing up the total, and that was it.

Q. How about those companies that didn't have a historical basis—new companies in the industry?

A. Those became a real problem because you were faced with the situation about the fellow who came into the industry at this time and wanted a supply of aluminum and at the same time pressures from the company who for all practical purposes had every right to expect to be taken care of because of past experience. So almost without exception we had to very frankly say to the newcomer "we are sorry but we must take care of our customers with whom we have done business before." Assuming it was not a military customer.

Q. Oh yes.

A. Bear in mind many times a good many of those people had particular allocations and therefore could get a control material application—the new ones.

Q. Well as a matter of fact I guess it was to take care of those people without the historical background that the [fol. 2052] federal government arranged some sort of a

set-aside program for non-integrated and small business concerns?

A. Exactly. And this is the problem we faced in Washington. Very frankly we always sat down with the people in Washington and pointed out the real problem, that here was a man who through no fault of his own arrived in business at a period like this and obviously needed aluminum, and particularly if he was a small business concern. Many times he could get a government allocation of some type or other. Of course at that time there were these competitors of ours going into the business and many of those fellows were taken care of by the new aluminum companies going into the business.

Q. I was interested in your testimony this morning as to the need prior to the Rome merger, when you felt the need for diversifying your wire and cable products. I am also interested in your comment about the testimony of an earlier witness—I guess you were referring to the president of General Cable.

A. I was.

Q. You recall I asked him if he thought aluminum would ever replace copper and he explained to me that he didn't think a large area of the wire and cable field would be taken over. I think you commented on it in your direct testimony. What success do you think, that the aluminum wire and cable factor, will have in replacing copper for most of its conductor use?

[fol. 2053] A. Well perhaps we are too optimistic but we believe that we still have some inroad to make in the copper business, in the copper electrical conductor business.

Perhaps I should qualify this immediately by pointing out to you, we talked about this transformer business, the windings of electrical machinery. The only way you can really eventually build aluminum into these markets where no material has been in existence is through some research and development work, some trial work on the part of your customers. You don't do it overnight. You may have confidence that aluminum will work but it doesn't always do it. But we have been reasonably successful and I have no bone to pick with my friend this morning but that is a very strong wire and cable company, and I really should defer to his better judgment perhaps, but I think we will make more inroads in

the electrical conductor business with aluminum than indicated this morning. I am sure whoever gets paid the salary in my job, whether it be Magee or my successor they got to be battling away on this because this is our stock in trade. We believe we will be successful. Of course if everything should settle down in Africa and they find some big copper mine and the price of copper goes down, this would be an adverse factor. My statement is based on the fact that copper is a reasonable commodity based on what it was some years ago.

Q. Do you feel that the reason aluminum is making such [fol. 2054] great inroads into copper, in the copper field today, is a question of price?

A. Yes, a lot of it, particularly in this insulated wire field. In the bare wire field of course we have some very definite advantages—long span with a steel core and so on. But largely you have the price factor involved, yes. We think aluminum has some other advantages which we tried to sell.

Q. You think aluminum does have some peculiar advantages?

A. We think it does in many places, yes.

Q. Now I would like to direct your attention to the comments on Rome and Alcoa getting together in 1952 and the breakdown of negotiations, and the fact that negotiations were subsequently revived and the merger was completed. Did you consider Rome to be the most desirable of the independent companies to add to your organization? You apparently canvassed the field. We can tell by some of the documents that you looked at several of the companies and came back to Rome. What was it about Rome that you people in Alcoa considered so desirable?

A. I suppose there are always intangibles. I wouldn't say it was necessarily the best possible acquisition. That would depend on the judgment of various people. When you analyze it you might determine some other company might be more valuable to us. There was the personal factor. Our relations over the years; our confidence in the people.

[fol. 2055] Q. Was it because they were in the copper wire and cable field and you were in the wire and cable field in aluminum?

A. They had a very fine research organization that was moving ahead in the insulating field where we had no background at all.

Q. And I believe you gave some estimate of the time and money you thought it would take if you did the job yourself?

A. Yes.

Q. Mr. Magee do you know of your own knowledge about what percentage of all domestic pig and ingot aluminum is actually imported into this country, in round figures?

A. What percentage is imported?

Q. About what percentage is used in a year's time?

A. There are some actual statistics and it has been varying lately. Oh yes, I guess this is what it is. This is Alcoa's production, its percentage of yearly supply, this is Alcoa's percentage, production percentage, of the total yearly U. S. primary and the U.S. imports in 1960—it was 34 percent. But you asked me the percentage of imports. Let me see—U. S. primary production is four billion pounds in 1960 and the imports about three hundred ten million. So we got there roughly plus ten percent in that particular year. If we take the year before, it varied.

Q. Yes.

A. For example in 1958 it was 510 million over three billion. So there it went up quite substantially. That is the [fol. 2056] year that I guess we were all hit with some—a lot of people were hit with some contracts that carried over from the active years of '56 and '57.

Q. Do you know what the import duty is on primary aluminum?

A. About 1¼ cents today.

Q. 1¼ cents a pound?

A. 1¼ cents per pound on Canadian aluminum.

Q. On Canadian aluminum?

A. Yes.

The Court: It seems to have jumped up back in '53 I guess it is—'52 or '53.

The Witness: That was the effect of the Korean situation. That was the Canadian aluminum which came in largely to help the production facilities in this country for the Korean period. Canada is a very substantial exporter into this country. It is the biggest.

By Mr. Melchior:

Q. You mentioned—I don't believe you used the term "commodity pricing" but I had the impression you were describing something of that nature in your direct testimony. Do you know what commodity pricing is? You ever hear of the term?

A. Well it is a term used in the trade. I think it is an old term in a lot of industries. It is the price—if I under- [fol. 2057] stand the term correctly—it is the price on some product that applies to some particular commodity. For example, I suppose a commodity price could be one that is on furniture sheet or furniture tubing. In other words used in the furniture trade. And the price established for the particular product that goes in the furniture, let's say.

Q. In other words if this same product went into a different line of production, the price going into the other line may be different—your price may be different; is that it?

A. It may be. But largely the specification, let's say, for this product is the individual specification very often. It may be finished; it may be tempered; an alloy, but usually it is a competitively derived price.

Q. One of the earlier witnesses testified,—I don't believe you heard him testify—I believe to the effect that in some cases aluminum pipe which is used for aluminum conduit may be characterized as selling for commodity price. Would you know what he meant by that?

Mr. Bergson: I don't recall any such testimony, Your Honor.

Mr. Melchior: I will rephrase the question. I think there was but I will rephrase the question.

Q. Are you familiar with the use of the term "commodity pricing" in connection with aluminum pipe to be used for [fol. 2058] aluminum conduit?

A. No. I wouldn't exactly call it a commodity price. I guess these terms are used rather loosely in the tratle.

Q. Yes.

A. But there is a price on aluminum conduit but whether that could be termed a commodity price or not, I don't know. It depends on the viewpoint of the individual. Aluminum conduit is a specific product made for a specific purpose and

use. Specifications are set up, has to be passed by the underwriters; lacquered inside and all this kind of monkey business.

Q. Is aluminum conduit a commodity price item for Alcoa, would you say?

A. I don't see where the "commodity" adds anything to it. I don't see the significance. All I am saying is there is an industry price or there are prices. Aluminum conduit is a commodity—I suppose you might call it a commodity. We call it a product. It is a product that is manufactured and there is a price on it. But the price is based on what you could sell it for. What the trade is willing to pay for it. But conduit is a specific product. Just as a soft sheet or a rod or a piece of pipe. We have pipe. We have tubing. We have conduit.

Q. It is a specific product which you can distinguish?

A. Yes. And I don't quite follow the commodity angle, because I don't see where commodity fits this particular term.

[fol. 2059] Q. Well I won't pursue it.

A. I don't see that it makes any difference.

Mr. Melchior: No further questions.

Mr. Bergson: No redirect.

(Witness excused.)

The Court: Recess until tomorrow morning ten o'clock.

The Clerk: Court is in recess until tomorrow morning ten o'clock.

(Whereupon at 5.10 p.m. o'clock an adjournment was taken to February 28, 1962, at ten o'clock a.m.)

Transcript of hearing—February 28, 1962

. . . . . .

[fol. 2062] Mr. Bergson: Shall I proceed, your Honor?

The Court: Yes.

Mr. Bergson: Mr. Davies.

RALPH V. DAVIES, called as a witness in behalf of the Defendants, being first duly sworn, testified as follows:

Direct examination.

By Mr. Bergson:

Q. Mr. Davies, will you please state your name and address?

A. Ralph V. Davies; 5040 Warwick Terrace, Pittsburgh, Pennsylvania.

Q. Mr. Davies, were you formerly employed by the Aluminum Company of America?

A. I was.

Q. Are you presently in a retired status?

A. Yes, for a little over two years.

Q. Are you presently a director of the Aluminum Company of America?

A. I am.

Q. How long have you been a director?

A. I think since 1958. I think that's right.

[fol. 2063] Q. When were you first employed by the Aluminum Company?

A. In 1919.

Q. And will you please state for the record your successive stages of employment up to the time of your retirement?

A. Well, I started in the Old Technical Treatment Bureau, and then I transferred to the Sales Department and was in sales offices in Rochester, New York, Buffalo,

New York, Washington, D.C., New York City, and then came to Pittsburgh in 1943.

Q. Now, when you were in New York City were you in charge of the New York office?

A. I was manager of the New York office, yes, sir.

Q. And you came to Pittsburgh in 1940?

A. '43.

Q. '43. And what were your duties in Pittsburgh then?

A. You mean when I first came?

Q. From '43, yes.

A. From '43 on. When I first went there I went as the sales manager for what we called pig in those days. I was only on that job a relatively short time when I was made [fol. 2064] assistant general salesmanager in charge of sales development. And in 1947 I succeeded George Stanley as vice-president in charge of sales.

Q. And how long did you hold the position of Vice-President in Charge of Sales?

A. Until my retirement.

Q. Now, as vice-president in charge of sales did your duties encompass the sale of wire and cable products?

A. Yes.

Q. Now, when you first became manager or vice-president in charge of sales what wire and cable products was Alcoa selling?

A. Bare ACSR and all aluminum. Those were the principal products we were selling. Oh, there was a textile covered cable, triple braid weatherproof, I think they called it, but the sales of that were really insignificant.

Q. Did there come a time when you considered the advisability of Alcoa's selling covered or insulated conductor?

A. Yes. I think the pressure began to come in from, well, through the staff men in Pittsburgh, who in turn were getting it from the sales offices to the effect that we should [fol. 2065] certainly diversify because we were not competitive. We were dragging behind in the parade at that stage.

Q. Now, when did you make the first effort to do something about this problem?

A. My first effort, as I recall it, I called Mr. H. T. Dyett, whom I had known for a number of years and for whom I had high regard.

Q. Would you identify Mr. Dyett?

A. Mr. Dyett was then Chairman of the Board of Rome Cable Corporation.

Q. And can you fix the time when you called him?

A. Yes. That was late in 1951; the fall of 1951, I would say. Late fall.

Q. Now, what did you do when you called Mr. Dyett?

A. I asked him, I guess I told him we were lamentably behind, I guess he would know that, in covered insulated wire and cable and asked him if we could make some arrangement whereby they, Rome Cable, would supply us with technical assistance and know how.

[fol. 2066] Q. So that you could make your own insulated wire and cable?

A. Yes, sir.

Q. Now, as a result of that telephone call did further events ensue?

A. Yes, I believe Mr. Dyett said he would be in touch with me in the near future. The next happening, I think Mr. Fraser called me and we made a date to meet and at that time he put out the proposition of a toll arrangement whereby they would cover or insulate or whatever was necessary to be done the material which we would furnish them.

Q. And what was your reaction to this proposal?

A. At that time, you mean?

Q. Yes.

A. Well, I thought that that was all right, that that certainly—well; it took us off of dead center; put it that way.

Q. Now, at the time you entered into the toll arrangement, was there any discussion as to the possibility that Alcoa might at a subsequent date insulate or cover its own aluminum line wire and multiplex?

[fol. 2067] A. Oh, yes. I would say right from the start we made statements to that effect. In fact, we were frank throughout the whole period of time that sooner or later we might feel it necessary to take some action on our own. There was never any misunderstanding on that score.

Q. And did there come a time during the course of the arrangement when you did take some action?

A. Yes.

Q. And when was that, if you recall?

A. Oh, that was about 1955. We decided to install equipment for the polyethelene covering.

Q. And did you go ahead with that?

A. We went ahead with that, yes, sir.

Q. Do you recall what equipment was involved?

A. Well, I know it required an extruder. I am not very technical on this.

Q. Well, let's pass it then.

A. All right.

Q. What prompted you to commence the manufacture of your own polyethelene line wire and triplex?

A. I think there were several reasons. Our sales depart- [fol. 2068] ment—of course, they are always pressuring us on these kind of things—they weren't satisfied. They were being told by customers that we weren't really contributing much, we were just selling someone else's product. We also —I think we had a strong feeling that we were still, oh, just nibbling around the edges. We weren't really getting in like we had hoped we would; and time was passing.

Q. Now, did you find, after you put in the polyethelene extruder, that you had made any substantial step in your diversification program?

A. We had made a step, but I don't know whether I would call it substantial.

Q. Now, did there come a time in '57 when you gave consideration to broadening your activities in the wire and cable field, insulated wire and cable field?

A. Yes. In '57 we decided now we had taken one step on polyethelene, we should go ahead with the neoprene coating, and we made studies and so on and put costs together as to what would be involved in that.

Q. Now, that neoprene coating would have been limited [fol. 2069] again to the aluminum line wire and triplex construction or multiplex construction?

A. Yes.

Q. And you made an investigation as to determine whether or not you should do that?

A. Yes, sir.

Q. Now, did you take any other steps at the same time in regard to your activities in the insulated wire and cable field?

A. At the same time we were looking into the neoprene proposition?

Q. Or shortly afterward.

A. Or shortly afterward. Yes, that was when we started negotiations with Rome Cable Company, discussing a merger with them.

Q. And what was your purpose in discussing merger with Rome at that time?

A. Well, several things had happened. It comes back in a way to the effect that we had to diversify more to become competitive in the marketplace. We also had the thought that if we were more active in this picture we could—we were quite optimistic, as we should have been, that we could substitute quite a little aluminum for copper and we thought [fol. 2070] we just had to have more knowledge of the whole subject to increase the consumption of aluminum in that field as well as to make diversified so as to make ourselves ompetitive with what was happening in the field at that time.

Q. What was happening in the field at that time?

A. Well, of course, for some period of time the copper companies were all going into the aluminum business, more or less, and then the next thing that happened was that a couple of the aluminum companies decided to go into the copper business: so you might say we were catching it both ways. The copper people were in our back yard, and now the aluminum people were going into the copper back yard, so we were becoming less and less competitive.

[fol. 2071] Q. Now, when you talk about copper people, who do you have in mind? What companies do you have in mind?

A. Well, there were a number of them. I don't know if I recall them all. There is Anaconda, Nehring, Essex, I guess General Cable, Southwire, Central; I think one or two others.

Q. All of those companies were getting into both aluminum and copper or were in both aluminum and copper?

A. Either were in or were getting into both, yes, sir.

Q. You mentioned also that some of the aluminum companies were getting into copper. Which aluminum companies do you have in mind there?

A. Well, Kaiser Aluminum and Chemical acquired the wire and cable division of U.S. Rubber and Olin Mathieson acquired Southern Electrical.

Q. Mr. Davies, I show you Government's Exhibit 161, which is a letter from Mr. P. T. Coffin to Mr. W. K. Unverzagt, copy of which was sent to you, and I invite your attention to paragraph numbered 7 of that document, on page 5, and ask you to refer or to note the phrase "Most Industry rocking announcement and certainly the most threatening [fol. 2072] to Alcoa's position," and ask you what message that memorandum conveyed to you?

A. Well, I think that in a way conveyed—well, it conveyed what I have been discussing in a way what had happened during that period, the position it put us in. Here we had dual roles and of course Coffin was a prominent advocate, he had been very strong in urging people in the organization to go ahead for quite a while.

Q. Did you personally, to what industry was Mr. Coffin referring, so far as you know, when he used the phrase "industry rocking"?

A. Well, I think that was, well, he is speaking about the wire and cable industry, but he is really pushing his point that now the need for diversification and threat of competition is more serious.

Q. Now, did you consider the acquisition, you personally, consider Kaiser's acquisition of U.S. Rubber or Olin Mathieson's acquisition of Southern Electrical "industry rocking"?

A. No, I wouldn't consider it industry rocking.

Q. Do you know what position U.S. Rubber occupied in aluminum Wire & Cable?

A. I would say a relatively small position.

[fol. 2073] Q. Let me show you the Government's charts——

A. May be very small, not relatively small, to keep it right.

The Court: What is that number, Mr. Bergson?

Mr. Bergson: 435. Government's Exhibit 435.

Q. Do you know when Kaiser acquired U.S. Rubber?

A. It was early in 1957. I would say March or April. It was March—February, March, April, around in that period.

Q. Now, what does the Government's chart show was the U.S. Rubber Plant's production of ACSR and aluminum cable, bare, in 1956, the year immediately prior to the acquisition?

A. It shows zero per cent.

Q. Now, addressing yourself to Government's Exhibit 436, which relates to shipments of aluminum wire and cable insulated or covered, what percentage does it show that U.S. Rubber had in 1956, the year prior to the acquisition?

A. 3.2 per cent.

Q. If you were considering the aluminum wire and cable industry, would you, would it be your opinion that this [fol. 2074] acquisition had any, effect on the aluminum wire and cable industry?

A. Oh, no. Not at all.

Q. Again directing your attention to Government's Exhibit 435, which is the chart entitled "Shipments of ACSR aluminum cable, bare," I ask you to look at Olin Mathieson Corporation and ask you if you recall what year Olin Mathieson acquired Southern Electrical?

A. That was in 1957.

Q. And what was Olin Mathieson's production of ACSR or aluminum cable in 1956?

A. Zero.

Q. And again addressing your attention to Government's Chart 436, I invite your attention to Olin Mathieson in 1956, and ask you what their production of aluminum wire and cable, insulated or covered, was?

A. Zero.

Q. So in your opinion, would that acquisition have any effect on aluminum wire and cable business?

A. No, it would not.

Q. So that what you were concerned with and apparently what Mr. Coffin was concerned with, was the effect of these acquisitions in the general field of wire and cable?

[fol. 2075] A. That's right, in the general field, plus mostly copper business.

Q. Now, you said that you, that these events plus the fact that the copper producers were going into aluminum led you

to the conclusion that Alcoa should do something about diversifying its product line in wire and cable?

A. Yes, sir.

Q. And I think you said just before I started asking these questions that you commenced negotiations with Rome Cable?

A. That is correct.

Q. And why were you interested in Rome Cable?

A. Well, for several reasons. We knew them well. We felt they were competent people. We felt that they knew their business. They had technical knowledge and facilities, of which Alcoa had none. Alcoa was just not qualified at all in that field. And everything we had heard about Rome Cable in the trade was complimentary. We knew their people and liked their people.

[fol. 2076] Q. Were you interested in Rome Cable because part of their product line included these so-called overlap products which are on the product board, the photographic copy of which is in evidence as defendant's Exhibit 20?

A. These aluminum products?

Q. Yes.

A. Oh, no, not at all. They were not really a factor at all in that. We knew that.

Q. Now, were you interested in them because they were engaged in the conduit business?

A. No. If my memory is correct, in spite of the fact that I had known the Rome people for a number of years and been at the Rome plant and talked with their people over a period of time, I don't think I even knew they were in the conduit business until we started negotiating. At least, that is my recollection. It certainly wasn't interesting at all. That wasn't the purpose. Maybe it was interesting, if you have something else thrown in; that is fine, too, but that didn't enter into the picture at all.

Q. Well, now, when did these negotiations with Rome Cable take place?

[fol. 2077] A. Through—these first negotiations?

Q. Yes.

A. Through the summer, summer and fall of 1957.

Q. During the course of these negotiations did Alcoa make an offer to purchase Rome Cable?

Q. Yes.

Q. Do you recall what that offer was?

A. The offer was in the form of common stock, a certain number of shares of common stock. As I recall it, the market price of the Alcoa common stock at that time—it would come to approximately $24 million.

Q. Did Rome accept that offer?

A. They certainly did not.

Q. Did they make a counter offer at that time?

A. They did not.

Q. And what happened to the negotiations?

A. We discontinued negotiating, I think, in about October of '57.

Q. Now, in October of '57 or after the Rome negotiations terminated, what action, if any, did Alcoa take to pursue its plan to diversify its product line?

[fol. 2078] A. Well, of course, first we talked a lot about it. Then we decided to see if we couldn't get someone in the consulting field to be of assistance to us.

Q. And did you act on that decision?

A. Yes, we acted on that.

Q. And what did you do?

A. We retained Ebasco Services.

Q. For what purpose, Mr. Davies?

A. Well, at the start we asked for advice, and then we asked them to act for us, make an investigation as to what firms might be available for purchase and that they should act on our behalf to see whether there was any interest.

Q. Why did you ask them to act on your behalf?

A. Well, in a case like that, it wouldn't have been very good for us to run around to one another. Of course, rumors spread fast; there were rumors at that time that other mergers—that some of our competitors were looking into other firms, and all we had to do was to go near one, and it would spread throughout the industry that Alcoa was out looking for somebody. I think that would hamper negotiations; it would certainly raise the price.

[fol. 2079] Q. Now, did Ebasco perform these services for you?

A. Yes, they did.
Q. Will you tell us what the first step was?
A. First they made up a list——
Q. Before we get to that—excuse me.
A. I beg your pardon.

Mr. Bergson: Will you mark this as defendant's Exhibit AR-77 for identification?

(Defendant's Exhibit AR-77 marked for identification.)

By Mr. Bergson: (Continuing)

Q. Mr. Davies, I show you defendant's Exhibit AR-77 for identification which is a letter from the president of Ebasco Services to you, dated April 3, 1958, and I ask you what that letter purports to be.

A. Well, this expresses in better language what I started to say a couple of minutes ago, I think. In other words, Mr. Gardner is outlining the procedure which they would follow.

Q. And did Mr. Gardner say—read the second paragraph into the record.

[fol. 2080] A. This one right here?

Q. The second paragraph.

A. "As we discussed, the first step would be to prepare a list of companies in the insulated cable and wire manufacturing field from published and other available sources. Pertinent data would be compiled on each, including size, sales volume, products, earnings record, capitalization, stock ownership, markets served, location and size of plants, affiliations or connections with other companies, banking connections and the like. From this preliminary data a number of companies will be selected by consultation with you as being most suitable for further study and more complete data will be obtained on these companies."

OFFERS IN EVIDENCE

Mr. Bergson: I offer defendant's Exhibit AR-77.
Mr. Mahaffie: No objection.
The Court: Received.

(Defendant's Exhibit AR-77 for identification received in evidence.)

By Mr. Bergson:

Q. Now, at the time you retained Ebasco Services to make this study for you, did you tell Ebasco what you wanted [fol. 2081] them to look for for you in the way of a company?

A. Yes.

Q. Can you tell us what you asked them to look for?

A. Well, in general it would be the same qualities which I mentioned before which we thought Rome had; in other words, a company well equipped technically, making products of good quality, having good management, having good trade acceptance and people with whom we thought we might be compatible. I think those are the essential qualities.

Mr. Bergson: Will you mark as defendant's Exhibit AR-78 for identification a memorandum dated June 16, 1958 to Mr. Richter from Mr. Huebner, both of Ebasco Services, Inc.

(Defendant's Exhibit AR-78 marked for identification.)

[fol. 2082] Q. I show you Defendants' Exhibit 78, which purports to be a list of considerations to be taken into account in examining prospective companies for Alcoa and ask you if that fairly and accurately states the considerations that you had in mind?

A. Yes, I think that is well stated.

Mr. Bergson: I offer Defendants' Exhibit AR-78 into evidence.

Mr. Melchior: No objection.

The Court: Received.

(Defendants' Exhibit AR-78 for identification received in evidence.)

Q. Now, you retained the Ebasco. What did Ebasco do for you?

A. I think they came up with a list of some hundred and twenty-five or thirty companies.

I think they examined that many and then out of that number of firms which they found in the business they made us a smaller list which contained quite a little data on the companies. I think they had brought that list down to some,

if I remember correctly, it was 28; it might have been 30, but I think it was 28. And then we talked it over with them and selected a certain number of firms which we felt [fol. 2083] might best serve our purpose.

Q. You say a certain number of firms. How many firms was Alcoa interested in acquiring?

A. Oh, we only wanted one.

Q. Now, do you recall which firms you agreed with Ebasco should be further investigated?

A. Yes.

Q. Would you state which firms those were?

A. Okonite, Simplex, Kerite; Triangle, Walker Brothers, Crescent Wire & Cable.

Q. Now, did you select any of those companies because they were engaged in the business of manufacturing any of these overlap products?

A. No. Not at all, because I don't think any of those firms were any factor in that business at all.

Q. Well, let's see what they were. Let's look at Government's Exhibit 435, and I ask you whether you find on the list of companies shipping ACSR and aluminum cable, bare, the Okonite Company?

A. I do not.

Q. Simplex?

A. No.

Q. Kerite?

A. No.

[fol. 2084] Q. Triangle?

A. No.

Q. Walker Brothers?

A. No.

Q. Crescent?

A. No.

Q. Now, directing your attention to Government's Exhibit 436, which relates to shipments of aluminum wire and cable insulated or covered, do you find on that list any of the companies mentioned? Let's take Okonite first.

A. Yes, I find Okonite.

Q. And how much of a factor were they in the business in 1958?

A. Two-tenths of one per cent.

Q. Now, do you find Simplex on that chart?

A. No.
Q. Do you find Triangle on that chart?
A. No.
Q. Do you find Walker Brothers on that chart?
A. Yes.
Q. And how much was Walker Brothers producing?
A. Six-tenths of one per cent.
Q. Do you find Crescent on that chart?
[fol. 2085] A. No.
Q. Now, are any of these six companies engaged in the conduit business, to the best of your knowledge?
A. I would just assume that Triangle was because they have that in their name. I didn't know that they did, I assume from their name that they must be in the conduit business.
Q. Did you know at the time whether any of the others were in the conduit business?
A. No, I wasn't interested.
Q. Now, after the six companies were selected what transpired?
A. Quite a period of time was consumed in running them down through various sources to see whether there was any interest on their part.
Q. And what was the result?
A. We drew a blank.
Q. I beg your pardon?
A. We drew a blank. No interest.
Q. I didn't hear because that truck was going by. So that that program apparently came to an end?
A. Correct.
Q. Now, did there come a time in October of 1958 when this program was at an end that Alcoa again examined [fol. 2086] what it should do?
A. Yes, they certainly did.
Q. Now, what did Alcoa do at that time?
A. Well, of course, again we had a lot of conversation. A study was started about that time, too, as to what would be involved into going ahead on our own, assuming we could make, could not acquire what we needed, and also to get an idea of what it might cost, what would be entailed, what it might cost, say, if we decided to go ahead on our own.

Q. And what problems did you consider in connection with this undertaking?

A. Well, it was full of problems. For one thing, I guess, as I said, we had no one with the proper technical knowledge and experience, which meant leaving out plants and plant sites and all that. We had to acquire personnel somehow. Right there was a large problem presented.

And, of course, the next question is where would you put it. That is a real question, too. And how much would it cost, because Alcoa always has so many places to spend its money that you have to consider that pretty seriously.

Q. Did you also consider the time factor?

[fol. 2087] A. Oh, yes, the time factor was very important because here we were, I guess I used the expression before, we were lagging behind the parade, and to go into this on ourselves was going to be a long time proposition. Just the planning and engineering alone was going to be a long time before you get down to business. So we felt that that was one of the very serious disadvantages, as well as the fact that, well, when you get going on these plants, no matter what you think you are going to spend, you always spend a lot more.

Q. About how long do you think it might have taken you to get into the wire and cable business, in the manner that you desired?

A. Well, before you—I might, when you say get in, and then of course you have got to consider, you get into something, of course, a lot of times faster than you make a satisfactory product. Then after you make a satisfactory product, it is quite a long while after that before you begin to make money out of it. So I would say in view of the fact that we felt the engineering would take a year before we got anything else done, I would say five to ten years, depending on what luck we had in acquiring people and deliveries.

[fol. 2088] Had Alcoa had any previous experience in building new establishments?

A. Oh, yes, we built a lot of them. That is why I was kind of leery about this one.

Q. Can you give us an illustration of a situation where Alcoa went forward with a new production facility?

A. Yes, I can. Take the example of the Davenport, Iowa sheet mill. When we went into that it was supposed to be a

twenty-five million dollar plant. Before we got through, I am not talking about today, now, I am still talking about, really you may say before that plant, it was a seventy-five million dollar job because after we started, people wanted to do this and that, they said, "Oh, well, there is no use putting up that plant unless you do this and do that," and so on. And in that case we knew our business, or we thought we did. We picked experienced foremen, experienced rollers from our other plants, and sent them out to Alcoa, to Davenport. Well, we, in the sales department, became very impatient because when they finally had this very expensive plant finished, the first thing that happened the quality [fol. 2089] wasn't too good, and so our delivery suffered. We were allocating metal there and then we would fall down on shipment. Then we didn't make any money, so, of course, that was worse. But I will say I don't mean to paint that too black, because that turned out to be, when everything was going right, to be a fine plant.

Q. How long did it take you to get that facility in operation, in a satisfactory fashion?

A. Operation? In making money? I think that took five years. And that is where we were supposed to know what we were doing.

Q. Now, Mr. Davies, if Alcoa decided to go ahead on its own, or if there were recommendations to go ahead on its own, would that recommendation require your approval?

A. Well, I would be one of several to approve. Of course, I wouldn't make the final approval.

[fol. 2090] Q. On the basis of the facts known to you in 1958, would you have approved such a program?

A. No, I would not.

Q. Why?

A. Well, for several reasons. One would be that the amount of money which seemed to be involved would kind of put a roadblock in my mind.

Q. How much money would have been involved?

A. I think we were talking thirty-five or forty million dollars and with the feeling that before we got through it would be more than that; and the time factor was still—between the money and the time—no, I wouldn't have been in favor of spending that much money.

Q. Now, did you in October of 1958 pursue any other course in order to get Alcoa into these other products?

A. Yes, I talked to—well, it just so happened Mr. Fraser of the Rome Cable Corporation was going to be in Pittsburgh. He came periodically to talk over our relationship and how things were going and so on, and so I opened the question up with him.

Q. I'm sorry, I didn't hear you.

A. I opened the question up with him again in October [fol. 2091] of '58.

Q. When you say you opened the question again with him, what did you do?

A. Well, I don't recall the exact conversation, but I think, as near as I can recall, I asked him whether there would be any interest in talking more about a merger.

Q. And what was Mr. Fraser's reaction?

A. Well, he certainly wasn't unfavorable to it. He said he would go back and talk it over with his people and be in touch with me later.

Q. And did he do that?

A. Yes, he did.

Q. And when did he get in touch with you?

A. Well, I would say within a reasonable time he called up and we made a date to get together again with himself and Mr. H. T. Dyett.

Q. Do you remember the date and where the meeting was to take place?

A. Yes. That was October 29th in the St. Regis hotel in New York.

Q. Now, prior to October 29th did you communicate with Ebasco Services to let them know that you were resuming negotiations with Rome Cable?

[fol. 2092] A. Yes, I did.

Q. What did you do?

A. I called Mr. Schlesinger there. I called him there—really, I was doing this as to what I thought was the courteous thing to do. In other words, they had been working for us and I think they were really probably still wondering, well, where do we go from here, just like we were. So I thought it was courtesy to call and tell him that we were

about to start further negotiations with the Rome Cable Corporation.

Q. Did you ask him for any advice as to how you should conduct the negotiations with Rome Cable?

A. No, I didn't ask him for any advice. I think I did say, in the course of the conversation, "If you have any helpful ideas, let me know," and he wrote me a letter, I think, two or three weeks—sometime later—analyzing some figures.

Q. I show you government Exhibit 407 which is a file memorandum dated October 28th, 1958, from Mr. Schlesinger to the files, and I invite your attention to the second paragraph or the first sentence of the second paragraph of that letter. I ask you to read that sentence into the record.

[fol. 2093] A. "Suggested that he point up to Fraser that Alcoa proposes to get into this business one way or the other and that he outline their philosophy of operating Rome if it should be acquired."

Q. Now, do you know what Mr. Schlesinger meant by "one way or another"?

A. No, I don't recall that part of the conversation because that wasn't in line——

Q. Did he suggest to you——

A. Beg pardon?

Q. Did he suggest to you to state to the Rome Cable people that, "if you don't sell out to us, we are going to go into business anyway"?

A. No.

The Court: What is the number of that exhibit?

Mr. Bergson: 407.

The Court: All right.

Mr. Bergson: At this time, your Honor, I would like to offer certain pages of the deposition of Mr. Schlesinger, whose deposition was taken by the plaintiff and who was examined about this document, and I think it is desirable for [fol. 2094] his responses regarding the document to be in the record, so I offer, without taking the time to read it into the record at this time, pages 88 to 100 of Mr. Schlesinger's deposition which was taken by plaintiff pursuant to notice dated June 30th, 1960 at the U. S. District Court, Southern District of New York, on July 18, 1960.

Mr. Mahaffie: No objection.

The Court: Received. That will be——

Mr. Bergson: I think we had better make this 78-A or 83 because I had planned to read it into the record. I don't have a consecutive exhibit number.

The Court: So that you people don't get mixed up, mark it whatever you wish.

Mr. Bergson: Why don't we make it 83.

Mr. Mahaffie: 83? What pages are you offering again?

Mr. Bergson: 88 to 100.

Mr. Mahaffie: That is all you are offering?

Mr. Bergson: That's all.

[fol. 2095] The Court: Received.

(Defendant's Exhibit AR-83 marked received in evidence.)

By Mr. Bergson:

Q. Mr. Davies, you had this meeting or did you have this meeting that was set up for October 29th?

A. We did.

Q. And who was present at that meeting?

A. Let me see. Mr. H. T. Dyett, Mr. Fraser, Mr. Hickman and myself.

Q. And during the course of those negotiations did Rome Cable make an offer to Alcoa?

A. In the St. Regis?

Q. Yes.

A. Yes.

Q. And what was their offer?

A. The offer was on the basis of four shares of Rome Cable stock—no, four shares of Alcoa stock for five shares of Rome stock.

Q. And what action did the Alcoa officials take on that offer?

A. That offer was turned down.

Q. At that meeting?

A. I think it was at that meeting.

[fol. 2096] Q. Then what was the next event in the negotiations?

A. I think this meeting of October 29th was in New York because Mr. Dyett was on his way to Florida, and I think the next thing that happened was that he called me from Florida to talk about it a little more, and as a result of that

conversation it was agreed that we should have a further meeting and negotiations.

Q. And was such a meeting held?

A. Yes, it was.

Q. Where was that meeting held?

A. That meeting was held in Pittsburgh.

Q. Do you recall when it was held?

A. It was around the middle of January.

Q. 1959.

A. Of '59, yes.

Q. And at that meeting did Alcoa make a counter offer to Rome?

A. Yes.

Q. And what was that counter offer?

A. That was on the basis of a five to three instead of a five to four basis.

Q. Now, were there any discussions—strike that, please. [fol. 2097] What action did the Rome officials take at that meeting in regard to that offer?

A. Well, I think they took a favorable attitude and said that they would present it to their board.

Q. Was there any discussion at that meeting as to how Rome Cable would fit into the Alcoa organization?

A. Oh, yes.

Q. If Rome Cable decided to accept the offer?

A. Oh, yes. Quite a point was made of that. Quite a point had been made of it before as to just how it would fit and how the organization would go and so on, and there was quite a lot of conversation on that score because the gentlemen who were there in the Pittsburgh meeting, as I recall it, were Mr. Fraser and Mr. John Dyett, and it was pretty well outlined to them what the policy of Alcoa would be if this merger went through. I am not sure whether Mr. Magee wrote a letter then or shortly thereafter.

Q. What happened thereafter?

A. Well, the directors of Rome accepted the proposition. There was some modification on the five to three offer.

[fol. 2097a] Q. I show you government Exhibit 6, which is a copy of a letter dated January 21st, 1959, to Mr. Fraser

from Mr. Magee and ask you whether that letter embodies the agreement as to how Rome Cable should be operated if Rome Cable accepted Alcoa's offer.

A. Yes, it does.

[fol. 2098] Q. Now, the next step, I think you said, was that Mr. Fraser took the offer back to Rome and then what happened?

A. Well, I believe it was presented to Rome; presented and accepted by Rome's Board of Directors.

Q. Now, were you present at all of the negotiations between Alcoa and Rome?

A. I believe I was, yes.

Q. During the course of these negotiations did Alcoa at any time use any type of threat to induce——

A. (Interrupting) Oh, no.

Q. (Continuing)—Rome to accept this offer?

A. Most definitely not.

Q. Do you know, Mr. Davies, and I know you have been retired since 1960, whether or not the provisions of the letter of January 21 have been followed out in the operation of Rome Cable?

A. Well, it is my understanding that they have been.

Q. Just one further question, Mr. Davies. I show you to Government Exhibit 110, which is a letter from you to Mr. Fraser regarding Alcoa's supplying aluminum to Rome in 1955.

A. Yes.

Q. Was 1955 a year of shortage?

A. Yes, I guess it was.

[fol. 2099] Q. Was this a temporary situation or a permanent one?

A. This was a temporary situation. It only lasted into the middle of the next year or so.

Mr. Bergson: Your witness.

The Court: Maybe we can take a short recess now. That a short recess.

(Whereupon at this point a short recess was taken after which the trial was resumed.)

Cross-examination.

By Mr. Mahaffie:

Q. Mr. Davies, directing your attention back to 1951 and 1952?

A. Yes, sir.

Q. You testified to the initiation of the tolling agreement between Alcoa and Rome covering aluminum wire and cable?

A. Yes.

Q. Was it the purpose of the toll agreement in so far as Alcoa was concerned, to more or less get Alcoa into the covered or insulated wire business?

A. As a starter, yes.

Q. It was a start?

A. Yes.

[fol. 2100] Q. Along that line. And if you know, Mr. Davies, can you state whether it was the purpose of Rome in entering into that agreement to get into the aluminum wire business?

A. My understanding of my recollection, of course, I am going back eleven years, it had this advantage to Rome, that they would get fuller utilization of their equipment.

Q. I see.

A. I would say it was a good business measure from their standpoint.

Q. You think as far as you know——

Q. Yes.

Q. (Continuing)—that was the principal purpose of Rome. Now, going up to 1955, you testified to Alcoa's decision to go into polyethylene covering on its own. Now, just to clarify that further, that was a definite decision of the company at that time in 1955; was it not?

A. Yes.

Q. To enter that field?

A. Yes.

Q. And Alcoa did enter the field at that time?

A. Yes. Well, it started in in 1955. It really wasn't in [fol. 2101] it in '55.

Q. Well, by the time of the merger of Alcoa and Rome, was Alcoa definitely in the polyethylene covering business?

A. Oh, yes, to a limited extent, of course.

Q. Well, you mean in terms of products?

A. In terms of products?

Q. You mean to a limited extent to the polyethylene products it made?

A. Yes.

Q. So was Alcoa in 1958 still taking any polyethylene products from Rome; if you recall?

A. My recollection is they were.

Q. Was it a substantial amount?

A. I assume it was not substantial. It would be just these things that we were not equipped to make. As far as evaluating it numerically, I couldn't. I don't know.

Q. Was the purpose of Alcoa to become completely independent of Rome in the polyethylene business?

A. No. I think we told them at the time we entered that of course we would still count on them for a certain amount of polyethylene covering.

Q. Would this be in respect to——

[fol. 2101a] A. I think our equipment was rather limited, and I think our knowledge was more limited even than that, so we were bound to want to acquire some products from them.

[fol. 2102] Q. But in 1958 the principal amount of the polyethelene covered products sold by Alcoa were made by Alcoa; would that be correct, sir?

A. I think that would be correct.

Q. Now, going up to 1957, this is when you testified the company, Alcoa, began at least investigating the possibility of using its own facilities to produce neoprene covered products?

A. Yes.

Q. Was a definite decision made in 1957 or '58 that Alcoa would go into neoprene covering on its own?

A. No.

Q. What was the status of that project, let's say, as of 1958?

A. I would say that was sort of in abeyance, maybe.

Q. During 1958?

A. '58. Now, let me think. I have got to get these years—I get mixed up on these years, '57, '58 and '59.

Q. Maybe it would be easier if I put it this way. What

was the status of Alcoa's neoprene planning on the eve of the Alcoa-Rome merger?

[fol. 2103] A. Oh, we had given it up.

Q. You had given up the neoprene planning?

A. Yes, that is my recollection.

Q. And you had determined to continue to rely on Rome for neoprene products?

A. Up until that time, yes, sir.

Q. Up until——

A. Well, you said until the merger, didn't you, up until the discussion of the merger? You might—I am not quite clear on your question there.

Q. Yes. Well, I am talking about January, 1959 or the end of 1958, the beginning of 1959. Now, Alcoa had determined in 1957 to enter into the neoprene business?

A. No, I wouldn't say they had determined to enter it. They had considered entering it and we had made studies of the equipment, what it would cost and so on, but no affirmative decision had been made.

Q. Do you know if funds had been appropriated for the purchase of equipment?

A. My present recollection is that what we call an authorization for money had been prepared but had not been received for final approval.

[fol. 2104] Q. Now, did you at any time in '57 or thereafter advise Mr. Fraser of Alcoa's intentions to enter into neoprene covering?

A. Yes, I think it was before that. I had told him that we were looking into that and might very well go ahead. That was just in line with what we had told him right from the start, that is, before we decided to make any further move, we would give them ample notice.

Q. What happened to your plans following the merger of Alcoa and Rome?

The Court: You mean——

Q. —plans for the setting up of facilities to cover or to apply neoprene covering to wire.

A. I don't think I understand.

Q. Following the merger of Alcoa——

A. You said after the merger of Rome?

Q. Yes. What happened to the plans you had after the merger with Rome, following the merger with Rome?

A. These plans were all dropped. Is that what you mean?

Q. Yes.

A. I didn't get the import of that.

[fol. 2105] Q. I am sorry, that is my fault. Now, with respect to this document that's been marked AR-78, the Ebasco document, would you tell me, sir, how the Rome corporation ranked with respect to each of those factors?

A. Well, of course, we thought from the start that Rome ranked very well in our minds as to having what we desired. Do you mean, could I go down these individually? I am not clear.

Q. Yes, sir. Would you say that——

A. The product line was good; technical manufacturing was good; performance good; plant location I wouldn't say was so good. The rest would be good. That would be the only thing I would say——

Q. As a result of your own studies and as a result of the work that Ebasco did for you, would you say that any other independent wire and cable manufacturer would have ranked any better than Rome?

A. No, I don't think so.

Q. In other words, it would be fair to say that in your view the Rome was about the best acquisition Alcoa could have made for the purpose it had in mind?

[fol. 2106] A. I think it would be as good as any, yes.

Q. Now, sir, you listed six companies which were more or less the final selection.

A. Yes.

Q. Following the failure of the '57 negotiations with Rome.

A. Yes.

Q. You listed Okonite, Simplex, Triangle, Walker Brothers and Crescent. That is Crescent Insulated Wire and Cable Company; isn't it?

A. Yes.

Q. Were any of these companies approached by Alcoa or by Ebasco?

A. Directly?

Q. Yes.

A. Well, I can answer, by Alcoa directly, no. I have to think a little about Ebasco directly. I don't think any of them were approached directly. I don't think that—no, I don't think they were approached directly.

Q. By directly, do you mean approached by Ebasco Company?

A. By an Ebasco representative going to the company.

[fol. 2107] Q. What about the Okonite Company? Was that high on your list?

A. Yes.

Q. What happened to your attempts to acquire Okonite, if you made such?

A. To acquire Okonite?

Q. Yes.

A. Well, I think we were really sort of getting the run-around and it took us a while to realize it.

Q. Isn't it a fact, sir, they were acquired by somebody else before you could acquire them?

A. Yes, but we did not know that at this time, although there were rumors floating around about not only Okonite but others, but——

Q. Who acquired Okonite?

A. Beg pardon?

Q. Who acquired Okonite Company?

A. Kennecott.

Q. Kennecott Copper Corporation?

A. Right.

[fol. 2108] Q. Now, Mr. Davies, you testified about Alcoa's alternate plan, if it could not make an acquisition?

A. Yes.

Q. To go it alone or get into the field on its own. Now, with respect to these plans, can you state generally what Alcoa's intent was? Was it intending to make a full line of copper products, a limited line of copper products; just what did it have in mind?

A. What we had in mind was that a considerable diversification and sufficient diversification so that we would be in a competitive position, and we had been in a non-competitive position for quite a long while. We also had in mind the fact that if we could establish this broader line of diversification, both aluminum and copper, that we hopefully

thought that being in that position we could increase the use of aluminum in the broad field.

Q. What you had in mind, then, sir, was substantially a full coverage of the wire and cable field, insulated wire and cable field?

A. Well, when you say "full coverage," I don't think we could have gone full coverage. I mean there are some things that maybe we would have to grow into. In other words, [fol. 2109] let's say some specific product. Maybe we wouldn't go into that. But quite a broad line. I am not technical enough to distinguish between various kinds of cables and wires and so on.

Q. Perhaps we can get into it this way. Was it your plan to manufacture building wire?

A. Yes.

Q. Communications wire?

A. Yes, I would say yes to that.

Q. Generally a pretty broad line although you are not sure of it?

A. I would say a pretty broad line, yes. We would have to get into a broad line to be competitive in the industry.

Q. Now, what stage were these plans in at the time of the acquisition of Rome? How far along were they?

A. The plans for our expansion on our own?

Q. Yes, sir.

A. Oh, they were in the—say a preliminary stage.

Q. Would you describe it as the survey stage?

A. Well, yes, maybe a little beyond that. I mean, to the standpoint of trying to estimate what would be required and what it would cost. Certainly what it would cost is a [fol. 2110] very important factor to be determined.

Q. Who within the company suggested this initially, if there was anyone individually?

A. Suggested this further study?

Q. Yes, sir.

A. Well, I heard Mr. Magee say yesterday that he was kind of impatient with me. I guess it was he.

Q. You testified that if it had been entirely up to you you think you would have recommended not proceeding at this point?

A. Yes, I did.

Q. Did you have any idea what Mr. Magee's views were on that?

Mr. Bergson: I think you should have asked Mr. Magee that when he was here yesterday.

The Court: Well, we let a lot of stuff get into this already so we will let Mr. Davies give us what Mr. Magee's idea was.

Mr. Mahaffie: If he knows, your Honor.

The Court: You asked if he had any idea what Mr. Magee's views were.

A. I think if I had been he, I would have had a tough job [fol. 2111] selling him on that. And that was cash, thirty-five to forty million cash, and a long period of time. I think it would have taken a lot of selling on him. It would on me.

Q. You actually spent about what for Rome Cable Corporation? Between twenty-five and thirty million?

A. Yes. I kind of forget the—you see, this is various times and places and stock.

Q. Yes. We worked out a stock range, the total price range between twenty-seven million and forty-one million over a period of a full year. Does that sound right to you?

Mr. Bergson: I think that price range, your Honor, is kind of ridiculous. It is the price at the time of the transfer and not what it might have been during the next succeeding eleven months. Although I do think that Mr. Fraser testified that the price was about thirty-three million dollars.

Mr. Mahaffie: All right. I will back down on that.

Q. Does the figure of thirty-three million dollars sound right to you?

[fol. 2112] A. Are you asking me the question?

Q. Yes. Does the figure, thirty-three million dollars, sound about right to you?

A. Yes. I think that is substantially correct. The value of the common stock at that time.

Mr. Mahaffie: Yes, sir. No further questions.

Redirect examination.

By Mr. Bergson:

Q. Just one question. You acquired Rome for the treasury stock of Alcoa?

A. That's right.

Q. And not cash?

A. Oh, no, not cash. It is quite a difference.

(Witness excused.)

Mr. Bergson: Mr. Reece.

[fol. 2113] Kemp W. Reece, called as a witness in behalf of the Defendants, being first duly sworn, testified as follows:

Direct examination.

By Mr. Bergson:

Q. Mr. Reece, will you please state your name and address?

A. Kemp W. Reece; 35 Stonehouse Road, Scarsdale, New York.

Q. By whom are you employed, Mr. Reece?

A. Ebasco Services, Incorporated.

Q. What is your position at Ebasco?

A. I am Executive Vice-President and a Director of the Company.

Q. How long have you been executive vice-president?

A. Since about the first part of 1956.

Q. And prior to that what was your position?

A. I was vice-president and a director in charge of engineering and construction for our company.

Q. For how long?

A. From 1952 to 1956.

Q. Now, Mr. Reece, what business is Ebasco Services, Inc. engaged in?

A. In management consulting services, engineering and [fol. 2114] construction for the utilities, electric and gas utilities, to industry and to governmental agencies.

Q. Now, Mr. Reece, directing your attention to the period in the early spring of 1958, did you have any meetings with any representatives of Alcoa?

A. Yes. In March, I believe the latter part of March, 1958, we had a meeting with Mr. Ralph Davies and Mr. Philip Coffin.

Q. And what was the purpose of that meeting?

A. Mr. Davies came in to talk with us about Alcoa's interest in getting into the insulated wire and cable field. He pointed out that in their opinion the insulated wire and cable segment of the utility industry had become of increasing importance and that Alcoa was not in this field and they were interested in getting, considering getting into it from the standpoint of their commercial position.

Q. Did you discuss with Mr. Davies and Mr. Coffin various ways by which Alcoa might get into the insulated wire and cable field?

A. Mr. Davies asked if we had any suggestions as to the methods or method which we thought might be most appropriate in getting into that field. We told him that in our [fol. 2115] opinion there were two methods that should be given major consideration.

One would be to set up a separate division, a new division of Alcoa in which they would engage the necessary qualified and experienced personnel; probably set up necessary research facilities and the physical manufacturing facilities to manufacture insulated wire and cable.

We suggested that a second approach, which we felt was more, may well be more practical and less expensive, would be to acquire a company that was already established and well recognized in the insulated wire and cable field. While we had made no study and talking from our general opinion, offhand experience, that the cost to the company would probably be less on this basis and certainly the time element of getting into such business would be very much less. We, in discussing this matter, we told them we had had a little experience on our own in which we several years ago had decided to go into the industrial engineering and construction field. Our previous experience had been primarily in

electrical utility and heavy engineering and construction field; that we had found that it was quite difficult to obtain [fol. 2115a] the qualified people that you needed to get into such field, and that we were considering acquiring or attempting to acquire a company that was well established in that field, as our experience indicated that such a procedure would enable us to better service industry.

[fol. 2116] Q. Did you try to go with your own?

A. Yes, we did. We set up an industrial and engineering department which was, I would say, reasonably successful, but we did not get the complete coverage of industry that we were seeking to get—in other words, to provide a broader range of services than we had actually developed.

Q. And did you ultimately acquire a company?

A. Yes, we did.

Q. Now, did you at the time indicate to them how long you thought it might be or how long you thought it might take for them to get into the wire, insulated wire and cable business if they proceeded on their own?

A. No, I don't recall that we did.

Q. Now, what ensued as a result of that meeting?

A. We were authorized in April, early April, 1958 by Mr. Davies to assist them in locating a company in the insulated wire and cable field that would meet certain general specifications that he gave us at the time. Those specifications were that the company should be an established, going organization, well accepted in the field, a company that was serv- [fol. 2117] ing the electric utility industry; a company that had well engineered products and products that were of high quality and so recognized in the industry, and a company who had seasoned and experienced management and a management that would fit in well with the Alcoa organization. I believe the word they used would be an organization that would be compatible with Alcoa.

Q. Did he indicate to you whether Alcoa was interested in acquiring more than one company?

A. Oh, no. They were interested in acquiring the know-how, really the know-how in the insulated wire and cable field, and there was no indication ever that they were interested in other than one company that was established in this field.

Q. Did he tell you that they had previous negotiations with Rome Cable that had been unsuccessful?

A. Yes. He mentioned that they had had discussions and, I believe, negotiations and that at the time he was talking with us they had decided the figure Rome was insisting upon was too high and that they wanted to explore other companies in the insulated wire and cable field.

[fol 2118] Q. Now, did you proceed with an exploration as a result of this meeting and the confirmation thereof that you just mentioned?

A. Yes, we started this exploration quite promptly.

Q. And generally, what did you do?

A. Well, this work was assigned to our people who were experienced in this field, and we compiled a list of quite a large number of companies in the insulated wire and cable field. In fact, I believe we tried to put together as near a complete list as we could of companies that were in this field of manufacture. After putting those companies together and getting preliminary information, we reduced the number of companies down to considerably less than the total to review with Alcoa.

Q. Do you have any recollection as to what the number was reduced to?

A. I believe it was 28.

Q. Now, after you selected these 28 companies, did you meet again with the Alcoa people?

A. Yes, our people met with the Alcoa people.

Q. And as a result of that meeting, what transpired?

[fol. 2119] A. It was decided that we would explore in more detail the availability of six of these companies, not only the availability but first the extent to which they met the specifications which Alcoa was interested in.

Q. And those six companies, are they the six companies that Mr. Davies referred to in his testimony this morning?

A. I am sure they were.

Q. Did you pursue the exploration of those six companies?

A. Yes. Our people checked into these companies rather completely through various sources, and Alcoa was kept advised of the developments.

Q. What was the ultimate result?

A. The ultimate result was that none of these companies were available or interested in merging or acquisition.

Q. Now, subsequent to that time did Alcoa advise you that it was resuming negotiations with Rome Cable?

A. Yes. Some of our people that were handling this work directly were advised by Alcoa that they were going to resume their discussions with Rome.

[fol. 2120] Q. Did Ebasco participate in any way with those discussions with Rome?

A. They did not.

Q. So that your participation in this program ended when the last company was found to be unavailable?

A. Yes. With respect to exploring any of the other companies, I believe that Mr. Davies asked some of our people for some general ideas with respect to Rome. I believe that there was a memorandum prepared covering those comments. I am not familiar with the details.

Q. Do you know whether or not those comments were directed primarily to the price that Alcoa should pay for Rome if it acquired it?

A. I am not familiar with the details of that memorandum.

Mr. Bergson: No further questions.

Mr. Wertheimer: No cross-examination.

(Witness excused.)

Mr. Bergson: Mr. Hickman.

[fol. 2121] Leon E. Hickman, called as a witness on behalf of the defendants, being first duly sworn, testified as follows:

Direct examination.

By Mr. Bergson:

Q. Mr. Hickman, will you please state your name and address?

A. Leon E. Hickman, 829 Osage Road, Pittsburgh, Pennsylvania.

Q. By whom are you employed, Mr. Hickman?

A. I am employed by the Aluminum Company of America.

Q. What is your position at the Aluminum Company?

A. I am an executive vice president.

Q. How long have you been executive vice president?

A. Since April, 1959.

Q. And how long have you been employed by the Aluminum Company?

A. Since April, 1951.

Q. And prior to—what was your position at the time of your employment?

A. I was elected vice president, counsel and a director in [fol. 2122] 1951.

Q. And you continued in that capacity until you became elected executive vice president?

A. Even a little longer after that. I remained as general counsel until February 1st, 1960.

Q. And you have been a director of Alcoa since '51?

A. Yes.

Q. Now, Mr. Hickman, in 1958 or 1959 did Alcoa have a merger program?

A. No, they did not.

Q. Alcoa did, in 1959, however, acquire Rome Cable Corporation?

A. They did, sir, under the circumstances that have been detailed by the preceding witnesses.

Q. But this was not part of any merger program?

A. No, quite the contrary. Alcoa has had no mergers or acquisitions over its entire history until this Rome matter came along.

Q. Now, after Alcoa acquired Rome, Alcoa subsequently acquired Rea Magnet Wire Company; is that correct?

A. Yes, sir. In January, 1960.

Q. Will you tell us how this came about?

[fol. 2123] A. This came about through a suggestion of Mr. Ross Fraser in the fall of 1959. He said that information had come to him that the Rea family of Fort Wayne, which controlled the Rea Magnet Wire Company, was considering selling to the company for family reasons, tax reasons and the like, and there had been some death of the senior member of the family, and it might possibly be on the market if we were interested in it. We knew—we, in Alcoa,

knew something about the Rea Magnet Wire Company. It was a fine company, somewhat smaller than Rome, engaged in an entirely different business, although a copper fabricating business. It was in the business of doing the wiring, largely or entirely in copper, for electrical machinery, transformers, coils, that sort of thing. There were no overlaps with Rome at all. It was in the small copper wire business in the electrical machinery field, whereas Rome was in the larger sizes and in the transmission of electricity, by and large.

There had been a basic change in Alcoa's position in the late 1950's in that more and more the aluminum business was becoming an end product business. Alcoa through the [fol. 2124] years had been largely in the wholesale aluminum business, selling to others who did the fabricating, but we were finding, as the other witnesses have detailed, that we were more and more handicapped by not having a fuller line of end product materials than we did. So we were interested in Mr. Fraser's suggestion that this company was on the market, and negotiations followed with them.

Q. And as a result of those negotiations, did you acquire Rea Magnet Wire?

A. Yes, sir.

[fol. 2125] Q. Now, Mr. Hickman, after you acquired Rome Cable in 1959, were any acquisitions of other wire and cable companies considered?

A. Aside from Rea?

Q. Aside from Rea.

A. Definitely not. And never have been.

Q. Now, I show you Government Exhibit 254, which is a letter from you to Mr. Magee, dated May 1, 1959, regarding the Narragansett Wire Company. Would you explain that situation?

A. After we arranged the merger with the Rome Cable Corporation apparently the word got around that our money was available to people who had companies to sell, and we had a good many suggestions made to us of other companies that were on the market, and this Narragansett Wire Company was one of them. As I recall it, our Boston district manager told us that the Narragansett Company had contacted him and said that they would be glad to sell out to us. I was new to this business. I had a natural curiosity as to

who this Narragansett Company was and also what the impact on the industry of that company changing hands might be. And I asked Mr. Fraser to tell me something about this company on the assumption that he in Rome [fol. 2126] would know about it, it being in the wire and cable industry, and he reported to me on it, as this letter indicates. And I replied to Mr. Palmer that we had no interest. But this, as a matter of fact, was just informing myself. At no time did either the people in Rome or the people in Alcoa entertain any thought of acting on the suggestion that this company might be purchased.

Q. Did the possibility that Alcoa might be sued by the Government for acquiring Rome Cable Corporation have anything to do with your decision not to go forward with the Narragansett acquisition?

A. Not the slightest. We found the girl. We were satisfied.

Q. Now, I show you Government Exhibit 265, which is a letter dated April 13, 1960, from Mr. Fraser to you regarding the Hitemp Company and ask you if you could tell us the circumstance surrounding the writing of that letter?

A. This Hitemp situation, that is H-i-t-e-m-p, was basically another one of the same sort of thing. A man by the name of Everstat told one of our officials that this company could be purchased, and the matter was referred to me be- [fol. 2127] cause I am the Alcoa contact with Rome, and I followed the same procedure. I asked Ross Fraser to tell me a little about the Hitemp Company and in due course he investigated and told me about it. We turned the matter down. Mr. Fraser does make the observation in here "In view of the fact we had been sued two weeks previous by the Department of Justice, it was obvious we couldn't consider the matter." But I am sure it was just as obvious to me, and I assume to Mr. Fraser, that it wouldn't be considered in any event. Because, as stated by the previous witness, Alcoa was seeking know how in this insulated wire business and we were satisfied Rome had it and we were not about to buy it twice.

Q. Now, I show you a series of documents, Government's Exhibits 261, 264 and 266, all of which relate to the Supre-

nant Manufacturing Company and ask you to tell us the circumstances surrounding those letters.

A. Upon a reading of these letter I find that the possibility of buying this Suprenant, that is S-u-p-r-e-n-a-n-t, was the one that was brought to our attention by Mr. Palmer, the manager of our Boston District Sales Office. And those [fol. 2128] things as a matter of routine in Pittsburgh were funneled to me by this time—and, as I say, there were a good many of them—and I followed the same procedure with them at this time. I wrote to both Mr. Fraser and Mr. Rea, of the Rea Magnet Wire Company, which we had then acquired, not knowing what field this Suprenant Company was in, and I asked each of them to let me know whether there was anything of interest in this company and said we should not give consideration to the matter before or unless one or both of you strongly urges to do so, even though legal conditions may be a complete consideration.

We, in Pittsburgh, had not the slightest interest and neither did the people in Rome or Rea, and we turned it down.

Q. And was this turned down primarily for business reasons and not because of the pendency of the lawsuit?

A. No. I would have to be perfectly candid in saying that we wouldn't be about to buy a company in the cable and wire business two weeks after the Justice Department sued us for acquiring Rome. On the other hand, quite apart from [fol. 2129] the lawsuit, we never had the slightest interest and wouldn't have the slightest interest if there had not been a lawsuit.

Mr. Bergson: Your witness.

Mr. Melchior: No cross-examination.

(Witness excused.)

The Court: We will recess until two o'clock.

(Whereupon, at 12:40 p. m. o'clock, an adjournment was taken to 2:00 o'clock p. m. of the same day.)

[fol. 2130] AFTERNOON SESSION

2:10 p.m.

APPEARANCES: As before.

The Court: All right.

Mr. Adler: Theodore Kerry.

THEODORE H. KERRY, called as a witness on behalf of the defendants, being first duly sworn, testified as follows:

Direct examination.

By Mr. Adler:

Q. Will you state your full name for the record, please?

A. Theodore H. Kerry.

Q. By whom are you employed?

A. The Aluminum Company of America.

Q. How long have you been employed by Alcoa?

A. Since 1941.

Q. What have your positions been with Alcoa since the time of your employment?

A. I was employed at our Massena plant in the accounting department in 1941. I transferred to a plant in Newark, Ohio in 1943 to become chief cost accountant of that plant. That was an Alcoa plant built for the government—Defense [fol. 2131] Plant Corporation. In 1944 I came to the Pittsburgh office as a staff accountant with specific responsibilities for wire, rod and cable cost accounting. In 1954 I became chief cost accountant of Alcoa. In 1956 I became administrative assistant, comptroller's division, and shared general comptrollership responsibilities with two other people; but specifically under my administration were several divsions, including the cost accounting division. I still hold that position, although in 1960 I added to my specific responsibilities the administration of Alcoa's budget program, and at that time the cost accounting function was transferred to another individual.

Q. All right. Have you been active in professional associations in the field of accounting?

A. I belong to the Comptrollers' Institute of America, and for about ten years, up until this fall, I was a member of the National Association of Accountants. I have never held any offices in those associations, but I have on various occasions been called upon to address these groups and other technical accounting groups on cost accounting practices.

[fol. 2132] Q. Could you describe for the Court the operation and function of Alcoa's cost accounting division?

A. Yes, of course, the primary responsibility of any cost accounting division, including ours, is to maintain adequate costs of its various products and product lines. In addition to that it is a part of our function to provide the sales management with data regarding the cost of the various products, mark-up factors which would account for overhead costs and which would return what the management deems is a desirable return on investment and thereby provide target sales prices for the various products involved.

Q. Is this in accord with accepted accounting practice in your judgment and experience?

A. This very definitely is in accord with the generally accepted responsibilities of the comptroller or comptrollership function. There may be many corporations where a part of this may be performed by some other division other than cost accounting, but it is part of the comptrollership responsibility.

Q. Now, referring to the development of possible target [fol. 2133] sales prices, did Alcoa face any special problem in this regard by virtue of the fact that it was an integrated producer—that is, because it produced both raw materials and intermediate products and finished products?

A. Oh, yes. For years we have had the problem of selling ingot or intermediate products to customers who were also competitors in the sale of the finished product. In these cases it has been our duty to provide the management of our company with data which would not only develop the target price for the products based on a desirable return, but also provide the management of our company with the situation that, to the best of our belief, would be the situation of a competitor who had to purchase an intermediate product at one of our prices, and then would have to sell that product or sell the finished product again at one of our prices, so it

has been definitely a part of our function to provide also, along with the target price, a picture of the profitability to the best of our ability to derive such a thing available to the customer-competitor.

Q. Could you describe briefly the type of or types of cal-
[fol. 2134] culations that you might make with respect to aluminum cable?

A. You mean describe the type of build-up that we would give with respect to cable?

Q. Yes.

A. Yes. We would—you see, we determine the actual cost of producing each item that we sell of cable. It is our practice to start with the market price of the ingot. This is transferred from our smelting division to our fabricating division at market price. Starting from that point, we would add the actual cost of producing the cable. We would add an allocation of our overhead expenses. We would add a mark-up factor which was based upon the invested capital, desired return on the invested capital in producing this cable—that is, the facilities—and thereby arrive at what is known in our company as a target price for the product.

[fol. 2135] Q. Now, was any additional problem presented because certain manufacturers start with redraw rod, purchase redraw rod, from which they make cable?

A. Yes. This is another one such as I mentioned a while ago. Customers start with ingot and customers also start with redraw rod. So in this case our sales department also wants to know; and we provide them with a similar cost build-up, such as I have described, excepting in this case we would start with the sales price of the redraw rod, the price which we would be selling it at to this customer-competitor, would go through the same process, assuming for lack of any other better way of assuming that competitor-customer had the same cost of producing the cable that we did.

Q. Do you assume this to be a valid assumption, that is the assumption that the non-integrated fabricator cost would be similar to yours?

A. Yes, I have to assume that. I wouldn't want to assume that we were less efficient. I don't believe I would want to assume the reverse either.

Q. Now, if in fact it were possible to achieve a sales price equivalent or close to the target price, is it your judgment [fol. 2136] that this would leave an adequate margin of profit for the non-integrated producer?

A. When you say if it were possible to sell at a price at or close to the target price.

Q. Yes.

A. Yes, sir.

Q. Now, Mr. Kerry, when the cost accounting division makes analysis of this type and develops information as to what an appropriate target price might be, how is such information transmitted to the sales department?

A. If this were a complete price revision of a whole line, it would have to be presented in tabular form. That is a schedule table. There may be cases where it may be transmitted in internal correspondence form, and in cases where you talk about one selected subject I have even known it to be transmitted verbally.

Q. Now, what has been done, what does the sales department do with this information?

A. They use this as a guiding line which will hold in front of them the desired target on where we would like to be. They also use, in the case that I mentioned, where we recon- [fol. 2137] struct the competitor- customer situation would be, they use this as a guide line to be sure that we do not on our own evaluation affect any price which would put the customer-competitor in an impossible situation.

Q. Is it at all times, so far as you are familiar, been Alcoa's policy to preserve an adequate spread for your customer-competitor in so far as this would be possible to do?

A. This has always been our policy.

Q. Have you yourself participated with sales department personnel in discussions you got in the establishment of actual sales prices?

A. Yes, I have participated in these discussions, particularly since becoming chief cost accountant and thereafter.

Q. Now, what has in fact been the ability of Alcoa and its sales department to realize a price commensurate with or approaching the target price developed in the cost accounting division since the period of shortly after the Korean War?

A. Increasing difficulty to the point where at least since 1957 I would say practically entirely impossible.

The Court: That is because of competition?

[fol. 2138] The Witness: Yes, sir. Yes, sir.

Q. Is that true with respect to aluminum cable as well as other products?

A. Yes. In recent years I think I can properly say most particularly true in the case of aluminum cable.

Q. I show you, Mr. Kerry, Government Exhibit GX-191 and ask you to look at that and to describe for the Court briefly what that document relates to.

A. This is dated in 1956. It relates to a meeting at which I had been present, one of the other members to whom this letter is addressed was Don Wilmot, at that time a vice-president of our sales department, and it relates to, during this conversation it was brought out, this was shortly after the Korean War, during the Korean War price controls had created a situation whereby our prices were definitely out of line, I would say at least out of line—during the Korean War price control had resulted in a situation whereby our prices were out of line with target and out of line with actual costs. So at this meeting I was asked to develop a schedule, a rough target price, whereby we knew that we netted a half [fol. 2139] a cent a pound increase on E.C. pig, as it was known then,—ingot it is called today—we knew that our cable prices were out of line.

I was also told that at that time we had to watch the redraw rod price because in recent years customers and also competitors by the use of Properzi Equipment had installed this new equipment, were buying ingot from us and in some cases were selling a redraw rod. Therefore, we could not blindly adjust the price of cable or the price of E.C. pig without again watching the spread situation. So I was asked to develop a recommendation as to what would be the theoretical pricing situation which would rectify our need for price revisions and would retain a spread situation somewhat on a historical basis which would permit, which would prohibit any possibility of a squeeze—I have to use the word—of a squeeze to either of these competitors of ours, the ones buying ingot and making rod or the ones buying rod and making cable.

Q. Mr. Kerry, why was an increase needed in the E.C. pig?

A. That is a matter—E.C. pig has closer operating limits. [fol. 2140] There is a closer control needed of the varied ingredients other than aluminum. This closer control, this happens in other alloys of ingot too, this closer control costs us money. I would like to say here that we cannot, no cost accountant can precisely account for this nature of cost as exactly how much it is. We know it requires more supervision, more metallurgical work. We know there has to be, of course, some price differential.

Q. And the same thing is true, I think you stated, with respect to other alloys or types or forms of aluminum product?

A. This is true in certain other alloys of pig, that is correct.

Q. Now, I believe in your testimony you stated that one factor, that the cost accounting division had to bear in mind in readjusting these prices was that an adequate spread be maintained, at least as a theoretical matter between the pig price on the one hand and the redraw rod on the other.

Now, in this memorandum you also state that the pattern of price increase suggested by you, "would return approximately what is needed without unduly opening the spread [fol. 2141] between redraw rod and cable." In other words, you appeared also to be concerned that there not be too wide a spread between the rod on the one hand and the cable on the other. Would you explain the basis of your concern in that regard?

A. You must remember that my function is to make the sales department and the management aware of the possible economical impact of any alternative decision which might be made. You also must remember that since I have three prices to be concerned with here, pig, redraw rod and cable, if the spread on the one opens, the spread on the other obviously closes. We have customers at both stages. So I am simply reporting to the sales department, as I was asked to do, here was the theoretical desirable situation which would return in the aggregate to Alcoa what we needed and would also leave all customers at any stage of the game with the relatively same spread which they had as far as I know successfully operated in recent years.

Q. Now, were the recommendations that you, on behalf of the cost accounting division, proposed in this document put into effect by the sales department?

A. These particular recommended increases were not put into effect in their entirety.

[fol. 2142] Q. Do you recall what was attempted at that time?

A. Yes, I do. The half cent increase on ECP was put into effect. If you will refresh my memory, what did I recommend on EC redraw rod on that letter? It is hard to read.

Q. Yes. I believe that was .014, I believe. I think you had better look at it.

A. Yes. This letter recommended .014 on redraw rod and my recollection is at about that time we increased redraw rod by one cent. My recommendation for cable was an average—and understand, there are many specifications, and this is only an overall average of many—I recommended an average of .018, and my recollection is that the effective average of everything which was done about that time was .015.

Q. Now, Mr. Kerry, in your judgment does the fact that Alcoa, through its cost accounting division, has attempted to analyze relationships between raw materials and finished product prices and has attempted to determine adequacy of spreads between such prices mean that Alcoa has had the power to determine what such spread might be?

[fol. 2143] A. Absolutely not. It is good practice. It is good practice, and I believe essential in good management, that we know where we would like to be and where our customers and competitors are or should be; but we have had absolutely no power to accomplish these things.

Mr. Adler: No further questions.

Cross-examination.

By Mr. Mahaffie:

Q. Mr. Kerry, just to straighten out a couple of things on this document, GX-191. Will you read, Mr. Kerry, the third paragraph on the first page—that is, the last paragraph on the first page which finished up over on page two

and then read the first sentence of the first full paragraph on page two.

A. Yes. First, let me say I have a very difficult copy to read, but I will try it. It is very difficult print. (Reading) "It seems to me that the significant point in this is that our present need for price increases in cable is occasioned by changes in our own facilities and operating practices. Since [fol. 2144] our competitors have not necessarily had parallel circumstances, we should be aware of the fact that any price increase at this time, although needed by Alcoa, may increase the margin available to a competitor to a point beyond that which has ever been available to him since 1948. This, of course, can be eliminated insofar as non-integrated competitors are concerned by making a corresponding price increase in redraw rod."

Q. Now, you testified it was Alcoa's policy, as exemplified by this document, in setting the prices of these two products to maintain the historical spread. I believe you used the word "historical", did you not?

A. I believe I did.

Q. That is, to maintain the spread which had previously been available to a non-integrated competitor?

A. I don't know if I made exactly that statement.

Q. Is that correct, sir?

A. If you will pardon me by saying as long as that spread is adequate, as long as that spread will result in the customer-competitor not having a loss, then I will agree with [fol. 2145] it; but I want to put that qualification in because, under some conceivable circumstance, if the historical spread, due to no power of ours, resulted in a loss situation, we wouldn't want to retain that historical spread any longer than we had to.

Q. Would it be correct that the purport of this language that you just read would be that you wanted to maintain that spread, you didn't want that spread to get too narrow and at the same time you didn't want the spread to get too big?

A. You must remember my position.

Q. Yes.

A. As an accountant, I am making my management aware of the economic impact of any alternative action, and in this I am doing just that. Since I know that we had cost increases due to an expansion program and certain circumstances that might not be existent in the case of competitors, it is incumbent upon me to make my management aware of the fact that an increase at this time may well widen the spread for the competitor. I don't know if this is good or bad, but I must make my management aware of this.

Q. Mr. Kerry, you testified to your knowledge it was [fol. 2146] Alcoa's policy, the policy of the sales department, to maintain what you described, I believe, as an adequate spread.

A. Correct.

Q. To competitors. Now, I ask now if you know, was it the policy of the sales department to make sure that this spread was neither too big nor too small?

A. I know that it was the sales department's policy to make sure that the spread was not too small because these are our customers. I do not know how I could even define what is too big a spread.

Q. I see. But that would be the only use to which this information which you read could be put; is it not, sir?

A. I was making the sales department aware, not that it was too big; I was making the sales department aware that it was possible that this would increase it. They must then use their judgment.

Mr. Mahaffie: No further questions.

Mr. Adler: No redirect.

(Witness excused.)

Mr. Adler: Mr. Gilbert.

[fol. 2147] THOMAS L. GILBERT, called as a witness on behalf of the defendants, being first duly sworn, testified as follows:

Direct examination.

By Mr. Adler:

Q. Would you state your full name, please?
A. Thomas L. Gilbert.
Q. By whom are you employed?
A. By the Aluminum Company of America.
Q. What is your present position?
A. I am a production assistant in the office of the general manager of the fabricating division.
Q. And how long have you held that position?
A. I have held that for one year and a half.
Q. Do you recall the date?
A. September 1st, 1960.
Q. What was your position prior to that?
A. Prior to that I was superintendent of the covered conductor department at the Massena plant.
Q. And what was the period covered by your employment in that capacity?
A. From 19— about mid 1956 until September 1st of 1960.
Q. And what were your responsibilities in that position?
[fol. 2148] A. The operation of this production department to cover and insulate aluminum cable to end up with products known as line wire and self-supporting service drop or multiplex cable.
Q. Now, prior to 1956 what was your position?
A. I was the superintendent of the cable accessory manufacture department in Massena.
Q. For what period?
A. From, I believe it was, early 1953 to mid 1956.
Q. Now, while you were superintendent of cable accessory manufacture, did you have other duties?
A. Yes, sir, I did. For a period I was assigned—I was given a special assignment as a liaison man to operate between Rome Cable and the Massena plant, and that assignment was in effect to solve any of the small problems that

naturally arose from trying to make the efforts of two different companies work smoothly in this tolling arrangement that has been testified to.

Q. Well, did you have a further responsibility with respect to wire and cable while you were in this position of [fol. 2149] superintendent of cable accessories manufacture?

A. Yes, sir. Following the liaison assignment, there was a period after our management decided to proceed with installation of facilities for the production of polyethelene covered line wire and service drop. I was given the responsibility of coordinating engineering efforts to choose equipment and install this equipment for the polyethelene covering and allied operations. This, of course, extended from about mid 1955 until I was assigned as the superintendent of that covered conductor department in early or mid '56.

Q. Now, we have heard testimony this morning from Mr. Davies regarding the installation of this polyethelene covering facility at Massena. What products were manufactured on that equipment that had formerly been made under the tolling arrangement at Rome?

A. Primarily two types of overhead conductor. Number one was line wire and number two was the twisted multiplex cables.

Q. With the polyethelene?

A. With the polyethelene covering and insulation, yes.

[fol. 2150] Q. Now, when this polyethelene facility was installed at Massena, were you any longer dependent upon Rome for the manufacture of the products you just described?

A. Naturally, in any new operation there is a period of breaking in and actually learning how to operate that equipment. Subsequent to this break-in period we were in a position to fabricate all our requirements for the polyethelene line wire and multiplex cables. So that we no longer needed, after this break-in period, to depend upon the tolling arrangement of Rome Cable to supply us with the polyethelene items.

[fol. 2151] Q. Now, at a subsequent date did you participate in formulating the request for authorization of funds for the installation of Neoprene covering equipment?

A. Yes.

Q. Now, with respect to this neoprene equipment, in what manner was it contemplated that Alcoa would receive the neoprene itself?

A. The neoprene was to have been purchased outside of the company in a pre-compounded state, which would then allow us to add this neoprene compound directly to our proposed neoprene extruder to put on the covering or insulation.

Q. Why did you not plan to do the compounding yourself?

A. Because we did not feel that it was necessary to purchase the equipment that would be required for compounding the neoprene.

Q. Did the products that you planned to make require any variation in the type of compound or type of neoprene covering that you might require?

A. No. We were convinced that the compounds required for these neoprene products we are speaking of were relatively simple and easy to exercise quality control over so that we felt we did not need to have the compounding [fol. 2152] facilities ourselves. In other words, the compounds necessary were rather standard and available from outside suppliers.

Q. Now, in your judgment if a neoprene extruding facility had been installed at Massena, would that have satisfied your requirements or would you have needed Rome to continue tolling part of your requirements?

A. We would have been able to supply practically all of the line wire items that we needed, and we would have been able to supply all of the multiplex neoprene products that we would have needed.

Q. Had this installation been made, in your opinion, would there have been any need for Alcoa to acquire Rome in order to give you greater polyethylene and neoprene capacity for the line wire and triplex products about which you speak?

A. Absolutely not.

Q. Now, I refer to certain of the product boards over here which you have examined, in particular the board entitled "Primary distribution-underground, and secondary distribution-underground;" the board entitled "Utilization," and the board entitled "Other representative Rome products."

[fol. 2153] photographic copies of which have been introduced into evidence as Defendants' Exhibits AR-16, 17, and 18, respectively. Would you at Massena have been able to manufacture the line of products shown on those boards with the equipment about which we have been talking?

A. If there were any items amongst that group that we could have manufactured with our equipment we did not know which ones they were. I can say that we did not think that we would be able to fabricate the line of product shown on the boards that you indicated.

Q. I refer you to Government's Exhibit GX-155, which is the proposed R/A, and refer to the statement therein that "If the neoprene extruding equipment were installed we would be able to produce rubber insulated high voltage cables if required."

Mr. Mahaffie: What page are you referring to, Counselor?
Mr. Adler: Page 2.
The Court: What is that number again?
Mr. Adler: GX-155.

Q. And I ask you to comment about that.

[fol. 2154] A. At the time we felt we would have had a basic extruder for neoprene that could also extrude rubber insulation. Being rather naive and new to the insulating game, we felt that we could make this material, which as I look back now and having learned more of, a little more about the insulation field, I feel certain that we would have been unable to do it for reasons such as the fact that we did not have the high voltage electrical equipment for testing purposes, which test would have been required. Nor did we, I believe, appreciate the extreme soundness that was required in the high voltage insulations. We would have had no way of checking whether we had ample insulation or not.

Q. Now, was a committee formed at some time to investigate the feasibility of Alcoa's establishing its own facilities for the manufacture of a line of products including the sophisticated types shown on those product boards.

A. Yes, sir. I was assigned to such a group in November of 1958.

Q. And what was your role in the activities of the Committee?

[fol. 2155] A. I was one of the junior members of the committee and the person that was assigned full time to this survey to determine what we would need in order to get into the production of this sophisticated array of insulated conductors that you referred to.

Q. What did you conceive the Committee's function to be in that regard?

A. The function would have been to investigate equipment necessary for this production; investigate the best plant site for production and thus closest to markets; and to determine naturally the building space that would be necessary and also to what extent we would have to rely upon the acquisition of technical know how from outside the company.

Q. Had anyone on your committee had actual experience in making these more sophisticated insulated products?

A. No.

Q. Had anyone on the committee had experience with the equipment used in making such products?

A. Other than my having seen them in various visits to insulating plants, I know of no one in the group that was familiar with the equipment necessary.

[fol. 2156] Q. Now, how did the Committee go about determining what products might be manufactured in such a facility?

A. Of course, we were limited in our direction by excluding magnet wire from our considerations and also from high voltage cable. That left the rest of the field open to our investigation, and we did our best to determine what those individual products would be by reviewing the catalogs that are published by some of the companies who also were into the manufacture of these products. It was a matter of judgment on our part to pick what we thought would be the popular items that we would be required to make in such a manufacturing set-up.

Q. Could you tell from examining the catalogs of producers the relative importance of various products or what relative quantities that you might be required to manufacture of each product?

A. No, sir. That was one of our very thorny problems in trying to determine what the needs of the different types of cables would be and in what proportion of volume they would be with respect to one another.

[fol. 2157] Q. Did you yourself consider some kind of research staff in organization to be necessary if you were going to get into the sophisticated type of insulated products?

A. Other than realizing that such research facilities would be required, we took no steps to determine what those facilities would have to be. We were not, in other words, the research investigation was not assigned to our group.

Q. You were limited to production facilities?

A. We were limited to production considerations, yes.

Q. Now, in the course of your committee's work, did you draw up any possible layouts of plants?

A. Yes, sir, we did.

Q. Were these considered to be an actual plan of a plant that would be built?

A. This was our best effort to put on paper what we considered necessary to produce a range of products really at which we were trying to cast our business. I do know, though, with such a setup would be a practical setup to cover the manufacture of this sophisticated line. It was a very preliminary look, possibly as a place to start from, with a more detailed study.

[fol. 2158] Q. Did your committee come up with an estimated total cost of facilities of the type you were——

A. (Interrupting) Yes.

Q. (Continuing)—talking about?

A. Yes, we did, and that amount was thirty-eight million dollars.

Q. Now, if we may, Mr. Gilbert, return to the present, would you state your responsibilities in your present position?

A. I now have to do with representing the general manager in the fabricating division in problems that have to do with products such as alloy wire, rod, bare structural shapes, electrical conductors, aluminum extrusions and aluminum drawn tube.

Q. Would aluminum conduit come within your field of responsibility?

A. Yes, sir, aluminum conduit is one of the products.

Q. Could you describe for the Court the equipment, well, the equipment needed to make aluminum conduit?

A. It depends, of course, what you consider the raw material. I would start, if the Court pleases, with an extrusion ingot, which is a cast aluminum ingot. That ingot is charted into the aluminum extruder which works somewhat like a [fol. 2159] toothpaste tube where you apply pressure and squirt out the extrusion, which in this case would be the pipe of the size we want to handle. Once that pipe is extruded, then it is sawed into lengths specified in the neighborhood of ten feet. Then those pieces of pipe are threaded on either end. Each piece of pipe is coated on the inside with a slip agent to allow insulated wires to be drawn through easily. One end of each pipe is fitted with a screw-on coupling. The other end is covered with a protector or some kind so the threads don't get banged up. And then after suitable labels are stuck on the outside of the pipe, a number of pieces of particular size are tied together and sent to our shipping docks.

Q. I show you Defendants' Exhibit AR-70, and ask you to state the number of producers of extruded shapes and drawn tube shown on that report.

A. 1950 there were 39 such producers. In 1955 110 and in 1960, 133.

Q. Mr. Gilbert, would you expect such producers to have the extrusion press about which you spoke, which you mentioned as one element of equipment needed in the manufacture of aluminum conduit?

[fol. 2160] A. Yes, sir, I would. With this one qualification, that the size of the extruder items, the size of pipe that can be produced. That of the 133 extruders I would suspect they could all extrude the more popular sizes of aluminum conduit.

Q. Now, what would your estimate be as to the cost of equipment needed for threading, labeling, lubricating pipe in order to make a good conduit? In other words, to go from the step where you have the extruded pipe to the point where you have a finished conduit?

A. I would think the figure of $15,000 would be probably more than ample to set up for such a fabricating operation.

[fol. 2161] The Court: I am just curious, Mr. Gilbert, about that extruding machine. I am not going to buy one. When the ingot, if you call it that, is placed in the machine it is subjected to pressure of some kind?

The Witness: Yes, it is a heated ingot, subjected to hydraulic pressure.

The Court: And when the pipe comes off, does it have to be cooled somewhere along the line?

The Witness: Yes, sir. In case of conduit, it is air cooling.

The Court: Air cooled?

The Witness: Air cooled, yes. There are fans from underneath this run-out table that blow the air up and reduce the temperature down to where the metal is not easily scratched and also is then rigid enough to handle, to saw and handle.

The Court: So that when the ingot is placed in the machine, it is pretty hot or comes hot after it is placed in the [fol. 2162] machine?

The Witness: It is placed in the machine already hot, in the neighborhood of 800 degrees Fahrenheit.

The Court: All right. That is just for my own information.

By Mr. Adler: (Continuing)

Q. Now, having returned you to the present, if we can go back for a moment to the time when this request for authorization of funds for a neoprene extruder was prepared, was that request ever given final approval, to your knowledge?

A. No, sir, it was not. It was given approval at the plant level and then up through a committee, investigational committee, who recommended to management that it be approved; but management did never, to my knowledge, approve—I am sure they never approved it.

Mr. Adler: No further questions.

Cross-examination.

By Mr. Mahaffie:

Q. Mr. Gilbert, would you run down, just so we get this all together, just what equipment is required to take an [fol. 2163] extrusion ingot through all of its various stages to finished conduit? Now, you described what the processes are. What I would like now is what equipment is required.

A. We need a furnace to bring the ingot to this tempera-

ture of approximately 800 degrees Fahrenheit. There are conveyors, simple conveyors that carry the ingot from the furnace to the extrusion press. The extrusion press is hydraulically operated and I would say that the press is operated, and the ingot, the hot ingot is extruded out through an extrusion die and as it comes out it takes the form desired—in this case, a hollow tube or pipe. May I ask whether you wish me to go on further than that?

Q. Yes, sir. I want to go all the way to conduit.

A. All right. Then the extrusions are cooled, as I have already described, and they are then sawed to whatever length is specified in the manufacturing procedure. Those lengths of pipe are then put into threading—handled into a threading machine which threads first one end and the pipe is turned around and it threads the other end. There is also [fol. 2164] a machine operation which takes any sawing burr away from the end of the pieces of pipe so that you have a smooth end that will not injure any insulation on the cable that are subsequently pulled through.

Q. Is that a separate machine that does that, or is that done in the threading?

A. It can be either. It can be either the same or separate. The threaded pipe is then lubricated by blowing through the pipe a spray of a lubricant which then adheres to the inside of the pipe.

Q. Is that a separate machine that does that, Mr. Gilbert?

A. Again, it can be separate or it can be part of an automated line. To my knowledge, most people use separate machines, and I have seen just simple hand sprays that have air hoses leading to them to do this spraying.

Q. Mr. Gilbert, is the word "stretcher" familiar to you?

A. Yes, sir.

Q. What is a stretcher?

A. I omitted the stretcher in the extrusion line. After [fol. 2165] the hot pipe comes out of the extruder, it is gripped on either end by mechanical grips, and then the pipe is stretched which makes it straight. Thank you.

Q. Now, is that—does the cooling process take place at the same time it is being stretched, or is that a separate process?

A. It is down to temperatures low enough so that the

stretching will take effect and end up with a straightened pipe.

Q. I believe you said it was air cooled. How is that done, sir? Is it done in racks? Is it cooled as it comes out of the extruder?

A. It is cooled as this piece of pipe travels down along conveyor or run-out table from the extrusion press.

Q. You have a run-out table which accomplishes the cooling?

A. Yes.

Q. And your stretcher picks it up?

A. Men pick it up and put it in the stretcher jaws, and it is stretched.

Q. Now, sir, directing your attention to document AR-70, Mr. Gilbert, the category which you noted on your direct [fol. 2166] testimony is labeled extruded shapes and drawn tube. Now, I ask what "drawn tube" is, Mr. Gilbert.

A. Drawn tube is cold worked tubing. In the aluminum industry you generally start out with an extruded tube bloom or thick walled pipe, actually. That thick-walled pipe is put through a die, using an interior mandrel, and the result is a cold working and reducing of the wall, and usually the outside diameter of the tube bloom, to result in a drawn tube.

Q. Well, does the fact that this category says "drawn tube" mean that—well, strike that.

Does the fact that a manufacturer makes drawn tube necessarily mean that he owns an extruder?

A. In the aluminum industry I know of no way to get a drawn tube without having an extruded tube bloom to start with. It is very possible that a company could buy, purchase outside of its own facilities, tube blooms for their production of cold drawn tubing.

Q. And then he draws the tube on his own machine?

A. I would assume he would.

Q. So then the figure which is shown here in the third [fol. 2167] column under 1960 of 133 producers does not necessarily represent 133 companies which have extrusion presses in their plants?

A. I would agree.

Q. Now, Mr. Gilbert, Mr. Adler asked you about this neo-

prene project in 1957 and '58. I wonder, sir, if you would have another look at GX-155 and 156. What is—well, I think you testified GX-155 is the so-called R for A which, I believe, means request for authorization of funds to set up facilities for producing neoprene covered wire; is that correct, sir?

A. That's correct.

Q. And GX-156—well, will you state what that document is, sir, GX-156?

A. GX-156 is a record of these subjects that were discussed and passed upon in a capital expenditure committee meeting in January, 1959 on the 8th.

Q. And would you, without reading it—would you state what the subject matter of the last item on page one is, sir? It is labeled "Massena M-2520."

A. The subject is the neoprene extruding equipment which in turn is referred to under the R for A, GX-155.

[fol. 2168] Q. So GX-156 represents the action taken by the capital expenditure committee on the request for authorization which is contained in document GX-155?

A. Yes, sir.

Q. Now, sir, what amount of money was approved by the capital expenditure committee in connection with that request?

A. Well, it is my understanding that the capital expenditure committee does not approve expenditure of money. It merely recommends to management that this is a worthwhile project and they are recommending that management favorably look upon it.

Q. Well, Mr. Gilbert, would you read the paragraph at the top of the page, the three-line paragraph that precedes the individual items on GX-156.

A. "The following matters were discussed in the meeting noted above. Approval of all of the items noted below was recommended by the full capital expenditure committee."

Q. And one of those items is this M-2520?

[fol. 2169] A. Yes.

Q. The neoprene extruding equipment. And it states that that item involves the amount of $475,000, does it not, sir?

A. Yes, sir.

Q. Now, Mr. Gilbert, turning to GX-155, I note there is—well, first of all, the request for authorization for this

neoprene extruding equipment is dated November 14, 1958, is it not, sir? That would be on the second page of the exhibit.

A. Yes, November 14, 1958.

Q. And the approval of the capital expenditure committee which we just referred to as dated January 13, 1959—am I correct, sir? I'm sorry, January 8th.

A. January 8th, yes, sir.

Q. Now, would you read the cover memorandum on GX-155, the memorandum dated July 27, 1959, from Mr. Little to Mr. Pellegrino, with a copy to you? What is the text of that memorandum, sir?

A. "Please cancel R for A, M-2520, purchase and install neoprene extruding equipment and rehabilitate the balance of Building 14 for occupancy."

Q. Is there a handwritten notation on that document?

[fol. 2170] A. Yes, sir.

Q. What does it say?

A. "Dead duck."

Mr. Mahaffie: No further questions.

Redirect examination.

By Mr. Adler:

Q. Referring to AR-70, do you personally know of drawn tube manufacturers which purchase what you referred to as a tube bloom—I think that was it—from other manufacturers and begin their operations at that stage?

A. I know—I believe I know of instances where our extruding plants make limited amounts of tube bloom for sale, but they are to my knowledge always very large sizes which come from the very high capacity or large size extrusion presses of which we are operators, but I do not know of any orders that we get for tube blooms of sizes such as you would use for making conduit.

Q. Would it be your conclusion, then, that the large majority of the 133 producers listed on this report would have their own extrusion presses?

[fol. 2171] A. That is my opinion.

Mr. Adler: No further questions.
Mr. Mahaffiie: No recross.

(Witness excused.)

Mr. Latimer: Mr. Pendorf.

JOHN S. PENDORF, called as a witness on behalf of the defendants, being first duly sworn, testified as follows:

Direct examination.

By Mr. Latimer:

Q. Mr. Pendorf, would you state your full name for the record, please?
A. John S. Pendorf.
Q. By whom are you employed?
A. Rome Cable Corporation.
Q. And in what capacity?
A. I am a statistician, head of the statistical department.
Q. How long have you been employed by Rome Cable?
A. Twenty-four years.
Q. And how long have you been a statistician for Rome Cable?
[fol. 2172] A. Twenty-three.
Q. Mr. Pendorf, I show you a chart which has been marked for identification as defendant's AR-82 which is entitled "Public utilities purchasing covered or insulated overlap aluminum conductor from both Alcoa and Rome in 1958," and I ask you if you prepared that chart?
A. Yes, sir.
Q. And from where did you get the information to prepare that chart?
A. The information came from the defendant's answer to the plaintiff's interrogatories, 10 and 11.
Q. And where did the information come from or which the answers to the interrogatories were based?
A. They were tab reports from company records.

Mr. Latimer: I will offer defendant's Exhibit AR-82.

Mr. Wertheimer: No objection.

The Court: Received.

(Defendant's Exhibit AR-82 for identification received in evidence.)

The Court: What is that chart again? I will take your description of it.

[fol. 2173] Mr. Latimer: I believe, your Honor, you have a copy of that in your chart notebook, the very last one. It is entitled "Public utilities purchasing covered or insulated overlap aluminum conductors from both Alcoa and Rome in 1958."

The Court: All right.

By Mr. Latimer:

Q. Mr. Pendorf, does that chart show all the companies which purchased the covered or insulated overlap aluminum conductor—and by that I mean the last two products on the product board, a photographic copy of which has been marked as defendant's Exhibit AR-20—does that cover all the companies who bought these products in 1958 from both Alcoa and Rome?

A. Yes, sir, they do.

Q. Now, could you state how many companies there are on this chart?

A. There are thirteen companies listed.

Q. And how many purchased $1,000 or more from both Alcoa and Rome?

A. There are ten of these companies that purchased more than a thousand from each.

[fol. 2174] Q. Now, I am going to list the utility companies who have testified at the proceedings here, and I wish you would check off the ones who are among the ten who purchased one thousand dollars or more of the overlap products in 1958: Central Hudson Gas and Electric Company, Central Illinois Public Service Company, Dayton Power and Light Company, Long Island Lighting Company, New York State Electric and Gas Company, Niagara-

Mohawk Power Corporation, Public Service Electric and Gas, and Rochester Gas and Electric.

Would you state how many of the ten companies that purchased more than a thousand dollars of the overlap aluminum conductor from both Alcoa and Rome in 1958 appeared as witnesses in this proceeding?

A. I checked off eight.

[fol. 2175] Q. Well, could you count just one more?

A. I got Central Hudson; Central Illinois; Dayton——

Q. I am sorry. It is my mistake. Strike Rochester. Subtract one from the answer you gave.

A. I got seven.

Mr. Latimer: Seven. Thank you. No further questions.

Cross-examination.

By Mr. Wertheimer:

Q. Mr. Pendorf, this tabulation which you prepared does not include any products other than aluminum line wire or aluminum triplex that was sold to the utilities in 1958, is that correct?

A. These figures represent the sales of aluminum line wire and triplex.

Q. Nothing else?

A. That's right.

Q. So any sales by Rome of copper products would be excluded?

A. They are not in here; that's right.

Q. Sales by Alcoa or Rome of ACSR or AAC would be excluded?

A. That's right.

[fol. 2176] Q. And this would not cover sales by Alcoa or Rome of all insulated or covered aluminum conductors or wire and cable to these utilities in 1958?

A. That's right, it would not.

Q. And this tabulation does not list all companies to whom Alcoa or Rome sold the so-called overlap products in 1958, or the companies to whom Alcoa or Rome sold aluminum covered or insulated wire and cable in that year?

A. It is a long question.

Q. Shall I break it down?

A. I think you have got to give it to me in little, short sentences.

Q. OK. This does not include any copper product sold to these utilities?

A. That's right.

Q. It doesn't include all aluminum wire and cable products sold by Alcoa or Rome to these utilities?

A. That's right, it does not.

Q. It does not include all the products included within aluminum insulated or covered conductor wire and cable sold to these utilities?

A. That's right, it does not.

Q. And it does not list all of the utilities to whom Alcoa [fol. 2177] or Rome sold these so-called overlap products in 1958?

A. Are you asking me if this is a complete list of the customers that Rome——

Q. Exactly.

A. This is not a complete list of customers that Alcoa and Rome sold line wire and triplex to.

Q. Right.

And it is not a complete list of customers to whom Alcoa or Rome sold insulated or covered aluminum wire and cable in this year?

A. That's right.

Mr. Wertheimer: No further questions.

Redirect examination.

By Mr. Latimer:

Q. Mr. Pendorf, is this a list of the common customers who in 1958 bought the insulated or covered products which both Alcoa and Rome were making, the only insulated or covered products which both companies were making—is this a list of common customers?

A. Yes, sir, it is.

Mr. Latimer: Thank you.

Mr. Wertheimer: Nothing further.

[fol. 2178] The Court: Wait just a minute. What this is is simply a list of concerns who bought covered or insulated aluminum conductor from both Alcoa and Rome in 1958.

The Witness: That's right.

The two items listed as shown on the attachment. The line wire and the triplex aluminum.

The Court: The line wire and the triplex.

The Witness: That's right.

The Court: All right.

(Witness excused.)

OFFERS IN EVIDENCE

Mr. Bergson: Your Honor, I am about to ring down the curtain on the Defendants' case. I have two exhibits that I would like to offer in evidence. Their relevancy may not be immediately apparent so I would like to explain the purpose of offering them.

One exhibit is a press release issued by the Department of Justice on June 5, 1961, and this has been marked, or I will ask that it be marked Defendants' Exhibit AR-79 for Identification.

(Press release above referred to marked as Defendants' Exhibit 79 for Identification.)

[fol. 2179] Mr. Bergson: You will recall, your Honor, that in the course of the argument on Defendants' motion to dismiss, Mr. Melchior made the statement that it was the Department's position that irrespective of all other considerations a company the size of Alcoa should not be permitted to acquire a company the size of Rome. And in the Government's brief the Government says, in explaining the reasons for the enactment of the Clayton Act, that there has been concern over the effect on individuals and communities remotely administered by giant corporations. Now, this press release, which I would like to offer in evidence, is a press release relating to a case that was brought by the Department against the Standard Oil Company of New Jersey and the Standard Oil Company of Kentucky. The case was settled, and as part of the settlement, the Standard Oil Company of California was brought in and was permitted to acquire the Standard Oil Company of Kentucky.

And the press release says: "Anti-Trust charges against the Standard Oil Company of Kentucky were terminated today by entry of a consent judgment permitting the firm to

[fol. 2180] merge with the Standard Oil Company of California."

Now, the press release—I will skip a little bit.

Mr. Melchior: Counsel, don't you think you should offer it before you read it into the record?

Mr. Bergson: Well, it is not in the record. I can't use it.

Mr. Melchior: Don't you think you should offer it first?

Mr. Bergson: I prefer to proceed the way I am proceeding.

The Court: I have got to find out what it is before I can rule on the admissibility. Go ahead.

Mr. Bergson: The press release then goes on to say that the Standard of California was founded in 1926. The California firm with principal offices in San Francisco is the twelfth largest corporation in the nation. In 1959 it had gross operating income of $1,564,827,112. And Standard of Kentucky had 1959 sales of $305,276,825. And then the [fol. 2181] Attorney General is quoted as saying:

"Despite the size of Standard of California we have agreed to this judgment and we have not opposed the merger because we believe it will stimulate competition."

Now, I have not read the complete release, but I think that it has a material bearing on this case in view of the position that the Department has taken in its brief, and in view of the position that Mr. Melchior took on oral argument, and I now offer the press release.

The Court: I assume there will be no objection, but go ahead.

Mr. Melchior: There is an objection, your Honor. There is an objection on the ground of relevancy.

We take no issue with any statement in the press release, but I think we should point out to the Court that this was a proceeding which was not under Section VII. This was a proceeding under the Sherman Act. And the document, since it is now in evidence, I think should be read in part to [fol. 2182] the Court.

Mr. Bergson: It is not in evidence yet.

Mr. Melchior: I beg pardon?

Mr. Bergson: It is not in evidence yet.

The Court: Go ahead.

Mr. Melchior: The complaint in this proceeding—what the situation briefly is, without going into too much detail, it was this: There was a marketing agency for Standard Oil of New Jersey and it was by virtue of these contractual arrangements between this marketing agency, which was the Kentucky Corporation, and Standard Oil of New Jersey that the Government sued. And the complaint charged that this sales contract between Kentucky and Standard Oil of New Jersey, the so-called 80 percent sales contract, violated Section I of the Sherman Act and Section III of the Clayton Act. It also charged that these firms had conspired in violation of the same section of the Sherman Act to allocate sales in certain states.

Now, it should be noted that the Kentucky organization was merely a marketing firm and had no production facil- [fol. 2183] ities. And through the settlement arrangement the parties agreed with the Government that the Kentucky sales organization should be divested from the Standard Oil of New Jersey and become a part of Standard Oil of California.

Mr. Bergson: What do you mean——

Mr. Melchior: May I finish. With the hope that the Standard Oil Company of New Jersey would set up its own marketing organization and thereby increase competition. There were really no change in facilities, merely a change of marketing organization from the Standard Oil of New Jersey to the Standard Oil of California.

The press release goes on to say "It is expected that as a result of the merger Jersey will set up its own marketing association to compete with the Kentucky organization in Mississippi, Georgia, Alabama, and those states where there is alleged to be the illegal contract."

And then the Attorney General goes on to say: "Despite the size of California we have agreed to this judgment and [fol. 2184] have not opposed this merger because we believe it will stimulate competition. Where we have had one giant in effect selling through Standard of Kentucky now we will have two competing against each other."

I think this, therefore, indicates a lack of relevancy in this press release to this merger.

Mr. Bergson: The fact that this case was a Section I or a Section III case is immaterial. The fact, the material fact,

is that this involved a merger. Standard of Kentucky was not a part of Jersey. It was a contracting party. It was a completely separate entity. And the Attorney General approved the acquisition or merger of a company with assets the size of Standard of California, of a company with assets the size of Kentucky.

Now, it seems to me that for the Government to get up here in this case and argue that this acquisition should not be permitted because Alcoa is so big and Rome was so big, [fol. 2185] that it doesn't make any difference what other effect there was, but this has an important bearing on that argument.

I think this is extremely material.

Mr. Melchior: I think perhaps the Court can take judicial knowledge of the fact that the transfer of the Kentucky marketing organization draws from Standard Oil of New Jersey, which is by far the largest petroleum company in the United States and the world to one, albeit large, but much smaller.

Mr. Bergson: May I ask what you mean by a transfer of the Kentucky organization? They have a contract.

Mr. Melchior: I am limited to what is in the press release, Counsel.

The Court: I mistrust that what Mr. Bergson wants to do is if you adopt the argument that size alone creates maybe a presumption of lack of competition or something of that kind, he would like to have this little press release as a shoring of his foothold, if you want to call it a toehold, I don't know what it is.

[fol. 2186] Mr. Bergson: I think it is more than that, your Honor.

The Court: I see no particular harm in it. It is a fact, and in our discussion I am not yet converted I don't think to the proposition that size alone is enough. So I don't think that it is of great importance here, I don't know what relevancy it has. Maybe the Attorney General, Mr. Bergson, made a mistake when he consented to that California merger.

Mr. Bergson: Well, I think he has made two mistakes, one when he brought this case.

The Court: I won't go into that. I went into that one because you mentioned it. Maybe he has a right to change

his mind. He may have been all right there and not here. I am not disturbed about that.

Mr. Melchior: May I state for the record that this Department does not oppose bigness as such. May I also ask the Court if it will indulge the Plaintiff the right to introduce or to offer the judgment in this proceeding, the consent judgment.

[fol. 2187] The Court: Yes. Let me finish with this first. Have you something else to offer?

Offers in Evidence

Mr. Bergson: The only other thing I have, your Honor, is Moody's Industrials on the size of Standard Oil of California and Standard of Kentucky.

The Court: All right, I will take it even before I give Mr. Melchior a chance. I will take it over your objection. What is the exhibit number?

Mr. Bergson: 80, sir.

(Defendants' Exhibits 79 for Identification and 80, received in evidence.)

Defendants Rest

Mr. Bergson: The Defendants rest.

The Court: Off the record.

(Discussion was held off the record which the reporter was asked not to take.)

Colloquy Between Court and Counsel

The Court: Before you go, I want to cross-examine Mr. Bergson a little bit. I want to get again or try to understand these things as I go along. The testimony of Nesti, and to apply it against certain charts. Now, his testimony, as I recollect it, indicated that NEMA's reports on certain products did not represent the complete industry.

[fol. 2188] Mr. Bergson: That is correct.

The Court: So that the charts offered by the Government, the numbers of which I wouldn't accurately state now, simply reflect that companies.——

Mr. Bergson: They reflect only the companies reporting to NEMA.

The Court: That's right. And apparently leaving with me, or wishing to leave with me, the inference that they are not, I don't like to use the world reliable, they are reliable as far as they go, but they are not complete.

Mr. Bergson: They are not complete as industry statistics.

The Court: All right. Now, there was equated in the testimony charts offered by the Government and received which were based on Census figures. And I can't remember those charts——

Mr. Bergson: I can give you the numbers, if your Honor please.

The Court: As distinguished—that is, I can't remember the Census charts as distinguished from the Nema charts.

[fol. 2189] Mr. Bergson: The Census charts are Government Exhibit 455.

The Court: 455. Yes.

Mr. Bergson: And Government Exhibit 458.

The Court: All right.

Mr. Bergson: Now, those are the only two Census charts on conduit.

The Court: In some of his testimony he testified, as I recollect it, one of his charts was made from the reports of twelve producers.

Mr. Bergson: I think the number is wrong.

The Court: Two of which were not, on cross-examination that was brought out, were suppliers.

Mr. Bergson: Those were seven aluminum producers and it was brought out on cross-examination that these two did not necessarily make their own aluminum. But he also testified that that had to be made by somebody and that somebody did not report it under the Nema statistics because under the Nema reporting system since their dues are assessed on that basis, nobody ever reports.

[fol. 2190] The Court: Yes.

Mr. Bergson: Now, in addition, he testified, your Honor, that there were four other aluminum companies that didn't report to Nema at all, and of those four I think three were witnesses in this case.

The Court: Yes. I think I got that part of it. The Nema end of it. I have not got the Census end of it right. Wasn't there testimony that this witness obtained the number of producers who reported to Census, he couldn't get their names because that was forbidden by statute. He got the number who reported and that applied to some particular item of commerce which is here.

Mr. Bergson: The number that he obtained from the Census, as I recall it, and I will stand corrected if I am wrong, and I think the number that he recited are the same numbers that were contained in the letter from this Census that the Government introduced as Government's Exhibit 500.

The Court: Yes, I think so.

[fol. 2191] Mr. Bergson: That they, the Census, as well as he, used 18 companies for steel conduit and they had seven companies for aluminum conduit, just as he did. So that he was confident that all companies had not reported to Census, No. 1. Number 2, because of affiliations, because of interplant shipments and foreign transfers and so forth, as equated against the Nema figures, that the Census figure even as mentioned by the letter of February 1, I think it is, was understated. Now, he did not state how much it was understated. He just expressed the view that it was substantially understated. And as far as I know the record in this case now remains open as to what the total Census Universe can or should be.

The Court: But if the Census only got reports of substantially the same number that Nema got and Nema didn't cover the whole industry, my problem is how far did the Census fail to cover the whole industry?

Mr. Bergson: This is the infirmity, your Honor. Now, Mr. Nesti testified he didn't know whether the 19 companies [fol. 2192] that reported to Census were the same 19 companies that reported to Nema.

The Court: Does anyone know how many companies?

Mr. Bergson: Census knows but it won't tell you.

The Court: Does the record, I will put it this way, do I have any way of knowing how many companies there are whose product should be included in the Universe figure to get a correct chart?

Mr. Bergson: No.

The Court: It is not in the record.

Mr. Bergson: I don't think the record would support a correct chart. Now, I must say, your Honor, that so far as the defendants are concerned, we don't think it is our burden to establish the correct chart. We know this is wrong. We cant' prove what is right.

The Court: Well, I know what Mr. Melchior, who is about to rise, is going to say. I can understand him. He is using the best figures that he has got and he advances the argu-
[fol. 2193] ment that the Census figure includes more than the particular production that we have in litigation here, besides those foreign shipments and so on, and fittings. And that therefore he asks me to infer that the Census figure is high in so far as it appears but he doesn't answer very directly to me why it shouldn't cover the production itself.

Mr. Bergson: Well, all I can say to that, your Honor, is that Mr. Nesti stated that in considering the fittings, the foreign shipments and everything else, he thinks that the Census figures are understated. Now, this is not in the record, and I don't know whether I should allude to it or not.

The Court: Well, we have violated almost every rule of evidence that I will go ahead and take one more thing.

Mr. Bergson: In Mr. Nesti's figures Youngstown Sheet and Tube is not included as a supplier of steel conduit. Youngstown Sheet and Tube is the largest supplier of con-
[fol. 2193a] duit in the United States and it supplies, I am informed, between 10 and 12 per cent of the conduit market.

I am sure that Youngstown Sheet and Tube reported to the Census. A company of that size, I am quite sure, would have reported to the Census. But this is one reason why his figure seems to be at variance with the Census. And the incomplete coverage of his figures.

[fol. 2194]. There is no question about that. We are trying to grab onto something, as a universe figure, which we can't come up with and we haven't solved the problem. We have cast doubt, I think, on what the government universe is and

the propriety of the government's universe and the propriety that we have such and such a percent of the market. I don't concede it to be adverse to show what our percentage of the market actually is. I think it is the government's burden to show what our actual percentage of the market is. I would have done it if I could have, but Mr. Nesti said that all he could say was that he was sure that the Census was substantially understated, but he couldn't say that instead of being 125 million it should have been 150 million or 140 million, and Mr. Melchior, on the cross-examination, didnt ask him what he thought it should be.

The Court: Well, I think I probably got my finger on the [fol. 2195] problem that exists in my own mind. How it is going to be eventually left or whether it is going to be left the way it is is something else. The question is, what can I do with it?

Mr. Melchior: On that point, we are going to try to clarify that for you tomorrow; but I would also like to state that you must recall that the NEMA witness testified that he collected with respect to aluminum conduit, particularly, statistics one way. His seven companies, he admitted—and defendant's answers to interrogatories admitted—it contained two companies who did not fabricate. They were merely resellers. So now with his five companies of the type that would report to the Census, Mr. Nesti is attempting to cast doubt on the Census total without one shred of evidence in the record that there is anything wrong with the Census total merely because he happens to have seven companies in his aluminum total and eighteen companies——

[fol. 2196] Mr. Bergson: That wasn't his testimony.

The Court: I don't go for that. He produced NEMA's figures and he says he knows that they do not cover the field. Now, for instance—but your witness, if I understood him properly, says your records are so close or they may differ quite a little, but anyway, when a thing like Youngstown is left out of his records, and presumably in yours, why the increase is not enough which says or satisfies him that you have the correct universe either, and I have no record and no way of knowing how many of these companies there are in the United States that make this particular product. I don't have it, do I? I don't have in the record how many report in the Census.

Mr. Melchior: Seven. That is in evidence.

The Court: On which particular seven?

Mr. Melchior: No, we do not have that in the record; or [fol. 2197] which particular eighteen, we don't have that in the record.

The Court: If you can clear it up, I will be glad to have you clear it up by proof. But it leaves it awfully hazy in my mind—the value of the universe that is set up in your charts. It is pretty definitely set in my mind that the value of the universe, based on NEMA, is of no value.

Mr. Melchior: I agree, the weight of the NEMA chart——

The Court: Is badly shaken.

Mr. Melchior: I agree with that.

The Court: There is certainly a doubt cast on the weight of the Census charts.

Mr. Bergson: Your Honor, if you will recall, the NEMA charts, when they were offered, were offered for the purpose of shoring up the Census charts.

Mr. Melchior: Now, if I may, your Honor, I will explain why that happened. You will recall in——

[fol. 2198] The Court: Listen, gentlemen. I really don't care what it is. What I am trying to do is to get a little better understanding out of these cases as they go along. If not, I will wind up on these charts badly balled up. In trying to think the thing through, the more I think the more confused I become. That is why I bring it up in this informal way to clear it, and it doesn't make very much difference—the reasons—you have two propositions, one that the NEMA Charts concededly don't represent the whole industry, so that a chart based on that is of very little value to me, I think.

Now, the next thing that there is is that the charts are based on the Census. Certainly this witness' testimony cast some doubt in my mind, at least, on the value of the Census reports of the universe figure. Now, it may be the thing has got to be left the way it is upon the theory that the government has given all they can. I don't know. If it could be [fol. 2199] cleared up, I think I would be a little bit better satisfied in my own mind, at least, because we are getting down here, I think, to a comparatively small proportion or percentage, where if you don't start out with the right uni-

verse figures, you can stray way off on your percentage figure as a result of it. There is my difficulty.

Mr. Melchior: May I make one comment on that?

The Court: Sure.

Mr. Melchior: I think the reason the witness was given an opportunity to impute the inherent weakness of the NEMA statistics was because of the strange coincidence that the numbers of these companies making conduit, generally, and in aluminum specifically, happened to be the same. You had two eighteens and two sevens, but what your Honor has to realize is that in the NEMA eighteen and in the NEMA seven there are some obvious duplications because the totals include some resellers.

[fol. 2200] Now, may I finish, counsel? Now, if from the NEMA total we could pick out the duplications and the resellers—and we know that there are two in the seven figure, leaving five—then there would be no inconsistency in comparing five with seven.

The Court: I don't follow you at all. I don't know whether there is seven or seventeen. If they haven't got the whole total of the manufacturers of that product, their universe figure is wrong.

Mr. Melchior: There is no evidence that the Census does not have the total, your Honor.

The Court: I know. I am talking now—you are talking about these two that are sellers. I don't see how that is important.

Mr. Melchior: Those two sellers would not have been counted by Census.

The Court: I don't care whether they were counted or not counted; NEMA says that the figures he has does not repre-

[fol. 2201] sent the whole industry. Now, it doesn't make any difference whether it is seven or five, he says; they don't represent it. If they don't represent it, you are starting on a false assumption to draw a percentage.

Now, how far the Census figures represents the whole industry, I don't know.

Mr. Melchior: We think they do.

The Court: I know, but there isn't much of any proof on it. In fact, doesn't the proof go just the opposite? For instance, let's say that 458——

Mr. Melchior: That is the aluminum.

The Court: That is based on Census?

Mr. Melchior: That is based on Census, yes, sir.

The Court: Now, that's the value of shipments of aluminum conduit in 1960. How many manufacturers are there in the United States in 1960 that make and sell aluminum conduit?

Mr. Melchior: We have from another document the figure [fol. 2202] from Census, seven fabricators.

Mr. Bergson: And, your Honor, you will recall that there were three witnesses who testified here, who are not included on the NEMA list—I don't know whether they were included in Census or not—but the fact of the matter is that——

The Court: There were more than seven.

Mr. Bergson: There are more than seven. And, your Honor, to clear up one thing about the NEMA statistics, you will remember that Mr. Nesti was most emphatic in stating there was no duplication in the NEMA figures and, according to our answer to the defendant's, or the plaintiff's interrogatories, we listed thirteen producers of aluminum conduit.

The Court: You see, that is what confuses me. I assume —and I will admit I don't know where it is in the record— that there are more than five or seven aluminum conduit manufacturers in the United States.

[fol. 2203] Mr. Melchior: There are a number of resellers, your Honor, but there is no evidence in the record, or there is no way to identify more than seven fabricators.

Mr. Bergson: I can name them offhand.

Mr. Melchior: In 1960?

Mr. Bergson: I could name them offhand, and you could name them offhand.

Mr. Melchior: This is one year.

The Court: You can see what my difficulty is.

Mr. Melchior: I can appreciate it, your Honor.

The Court: The same thing on this other one where we had eighteen. That is a different product.

Mr. Bergson: That is 465. That is the whole works, your Honor. You see, your Honor, that includes everything. It includes aluminum and steel. That is the other line of commerce.

Mr. Melchior: There is no way for the defendant to show [fol. 2204] that the Census total is not complete there. They know that NEMA didn't have Youngstown, that they didn't show—that Census did not——

The Court: Well, I think, Mr. Melchior, that that is right, that you have to get your reliance upon a percentage, which you are, and these charts. I think you do have to show its accuracy rather than the intentness to show it is in error. I think if they point out to you, if they raise no objection, I think the Court would be justified in finding it is accurate, but when they point out to you where there is what they call inaccuracies, they then—then the burden shifts back to you or stays with you. It never shifts at all—to show the accuracy of the chart.

Mr. Melchior: I will agree, if they demonstrated the inaccuracy, which I don't believe they have.

The Court: I think they have done enough to cast a little doubt on it.

Mr. Melchior: Well, apparently so. We will try to have a [fol. 2205] witness tomorrow to reassure the record.

The Court: All right. We will recess until tomorrow morning. Will you be ready tomorrow morning?

Mr. Melchior: Yes, we hope so.

The Court: How long?

Mr. Melchior: A very short time. I think we will have a handful of documents and two witnesses.

The Court: You will finish tomorrow?

Mr. Melchior: Yes.

The Court: Tomorrow morning at ten o'clock. Recess until tomorrow morning at ten o'clock.

(Whereupon, at 4:08 p.m., an adjournment was taken to Thursday, March 1st, 1962, at ten o'clock a.m.)

[fols. 2206-2207] [Title omitted]

Transcript of hearing—March 1, 1962

* * * * * * *

[fol. 2208] The Court: Mr. Bergson, while you rested yesterday I suggested that you check over your exhibits so there will be no misunderstanding about it. Have you done that?

Mr. Bergson: Yes, your Honor. We did check over our exhibits and we find that we had offered all that we intended to offer. During the course of the Government's case we had marked for identification six exhibits which we did not offer in our own case. These are Exhibits AR-1, 2, 3, 8, 10, and 11.

Now, 1, 2 and 3, I believe, your Honor, were the earlier versions of some of the charts that were introduced because at that time we didn't have 1961 statistics. And when we got the 1961—I mean, we had marked for identification, not introduced. When we got the 1961 statistics we substituted the more up-to-date charts for the ones we had previously marked for identification.

The Court: Yes. The way I have it, I think that might be right, from my notes.

Mr. Bergson: I can check it in a minute.

The Court: I don't think it is necessary so long as you [fol. 2209] agree among yourselves. Then with that you rest again?

Mr. Bergson: Yes, sir.

The Court: All right. Rebuttal, Mr. Melchior.

Mr. Melchior: Mr. Leo Finn.

LEO V. FINN, called as a witness in behalf of the Government, being first duly sworn, testified as follows:

Mr. Melchior: Will you mark this for identification?

(Chart and tabulation attached marked as Government's Exhibit GX-502 for identification.)

Direct examination.

By Mr. Melchior:

Q. Would you state your name and place of employment?

A. Leo V. Finn. I am employed in the Antitrust Division, Department of Justice.

Q. What is your present position?

A. I occupy a business economist's position.

Q. How long have you been employed by the Antitrust Division?

[fol. 2210] A. I have been employed in the Division about 23 years.

Q. What is your educational background?

A. I am a graduate of Columbus University and have a bachelor of commercial science degree.

Q. Now, Mr. Finn, in connection with your assignment to the Rome-Alcoa proceeding, have you prepared a chart and tabulation dealing with the production and sale of primary aluminum by Alcoa?

A. Yes, I have.

Q. Would you identify it?

A. This chart and accompanying table is entitled "Alcoa Primary Aluminum Production Sold to Customers and Used by Alcoa."

Q. It there a tabulation attached thereto, Mr. Finn?

A. Yes, sir, there is a tabulation that accompanies this chart.

Q. Now, what does this chart and tabulation purport to show?

A. Well, it shows a relationship between Alcoa's production and the volume of primary aluminum they have used in their own operations, and the volume that has been sold to outside their own operations. Also it includes the invento-

[fol. 2211] ries at the beginning of the year and the inventories at the end of the year.

Q. Now, what period of time does this chart cover?

A. It covers from 1950 through 1960.

Q. What were the sources of information you utilized, Mr. Finn, in preparing this chart and tabulation?

A. This tabulation is from the Defendants' Exhibit AR-44 and AR-44A.

OFFER IN EVIDENCE

Mr. Melchior: I offer Government's Exhibit 502 for identification.

Mr. Bergson: No objection.

The Court: Received.

(Government's Exhibit GX-502 for identification received in evidence.)

Q. Mr. Finn, directing your attention to Government's Exhibit 502, and in particular the chart, what is the relationship between Alcoa's production of primary aluminum and the volume of primary aluminum used by Alcoa in its own operations?

A. Well, this shows that over this period of time, from 1950 to 1960, the dominant part of the production has been used by Alcoa in its own operations. In comparing the volume used by Alcoa to the amount that they have sold outside [fol. 2212] their own company, has been relatively small in comparison to the amount that they have used themselves.

Q. Now, have you made any computation as to the percentage of its primary aluminum production which Alcoa used in its own operations?

A. Well, for instance, in 1960, the last year we have here, about 67 per cent was used in their own operations, and in 1959 there was about 86 per cent, and it has varied somewhat. In 1957 it dropped, it was down to 53½ per cent.

Q. And how do you tell that by looking at the chart?

A. Well, of course, the chart doesn't show any percentage but it is meant to be visual that you can see it.

Q. Which particular shaded area would that be?

A. Well, I think at the top you find a legend to the chart and if you are attempting to find out or to compare the amount used by Alcoa, you merely refer to the legend.

Q. Now, does this chart demonstrate any relationship between Alcoa's production of primary aluminum and its sales of primary aluminum to non-integrated fabricators?

A. Yes, it does.

[fol. 2213] Q. Would you state what that might show in one of the recent years?

A. Well, for example, in 1960, it shows about 7.8 percent was sales to fabricators; in 1959, about 13 percent; in 1958, about 16 percent, 16 or 17 percent.

Q. Now, does this tabulation indicate in any way the volume of primary aluminum that was exported or which was held in inventory by Alcoa at the end of any particular year?

A. Yes, there is a total figure here which includes—it is consolidated with exports, stockpile, toll conversion, exchange and sale to other primary producers.

Mr. Melchior: You may examine.

Cross-examination.

By Mr. Bergson:

Q. Mr. Finn, do you have available to you Defendants' Exhibit AR-44—well, here, I will show you my copy. Doesn't that chart also show that the majority of Alcoa's primary production was used in its own fabrication?

A. Yes, it does.

[fol. 2214] Q. Now, may I ask you why in preparing Chart GX-502 you did not provide for unused capacity of Alcoa in the chart?

A. Well, the purpose for which I drew this chart was to base it entirely on actual transactions that had taken place in the company over this period of years.

Q. But if you had shown unused capacity, you would have shown more aluminum available to independent fabricators, would you not?

A. Well, not in the sense that—well, capacity is sort of an intangible, the amount of production—what I am trying to say, yes, there would be some excess capacity to make more aluminum, but, as I say, this chart doesn't deal with that sort of phantom figure.

Q. If that is such a phantom figure, why did the Government in its case in chief introduce a chart on aluminum

capacity in the United States for the year 1960? This is Government Exhibit 465.

A. Well, the relationship there is capacity to capacity, and I have no quarrel with that.

Q. Is it really phantom if it is available, if there are orders for it?

[fol. 2215] A. Orders for it?

Q. Is excess capacity really phantom if it is available to fill orders for aluminum?

A. Well, the capacity is there to make more aluminum, I will agree with that.

Q. Isn't that highly significant? Hasn't one of the Government's contention in this case been that because of Alcoa's acquisition of Rome, and try to show because of its acquisition of Cupples, there would be less aluminum available for non-integrated producers?

A. Well, I think the record shows that there are many statements with respect to capacity of Alcoa as compared to the rest of the industry, and when I drew this chart I merely confined it to actual transactions that had taken place in the company.

Q. Well, in drawing this chart you show a lot in this crosshatched—I guess it is not hatch, these diagonal lines would show amounts in inventory; don't you think that Alcoa would have been happy to sell that if they had the opportunity to sell it?

A. Undoubtedly.

Q. And don't you think that Alcoa would have been happy to use its unused capacity if they had orders for it?

[fol. 2216] A. Yes, I do.

Q. So that when you said in 1960, for example, that 7.6 per cent of Alcoa's production was to non-integrated fabricators, how much would you say of its production was available for sale to non-integrated producers?

A. Well, of its production in that particular year, the rest of the inventory would be available.

Q. And would not its excess capacity be available?

A. Yes, if the market warranted it.

Q. So, therefore, 7.6 isn't a fair figure?

A. Well, it is based merely on transactions that had taken place.

Q. But it doesn't prove anything?

A. I am not trying to prove anything here.

Q. I thought that is why the chart was offered.

A. Well, I am trying to enlighten——

[fol. 2217] Q. Frankly I don't see how this chart is any more enlightening than our chart, AR-44 was, except that you do it in bars and we did it in graph form.

A. I like to think that this is more readily readable and, of course, there were some adjustments made in the figures.

Q. Now, in—were the adjustments major or minor?

A. Oh, minor.

Q. To what degree? Would it be as much as one percent?

A. I am speaking about the sales and particularly the export sales in the latter years that were on the other chart. I think that those were adjusted by the introduction of AR-44-A.

Q. They weren't adjusted, were they, they were made clearer?

A. It was a supplement.

Q. Yes. They were made clearer. Now, in discussing Alcoa's percentage of production used in its own fabrication as against its total production, you gave us the figures for the year 1960, which I think you said was about 67 percent.

[fol. 2218] A. Yes, about 67 percent.

Q. And for 1959?

A. It was about 86 percent.

Q. And for '57?

A. 53 percent.

Q. You didn't give us the ones for '58; did you?

A. No.

Q. What were those?

A. 68 percent.

Q. 68 percent? It looks to me like it has to be a little lower.

A. In '58 you speak of?

Q. Yes.

A. I got a rough figure here of about 68 percent.

Q. Well, it doesn't matter, I just wondered why you took '57, '59 and '60 and didn't use '58.

A. Oh, no, I just skipped over.

Q. Now, Mr. Finn, you have been here during the course of the entire trial, haven't you?

A. Yes.

Q. And you heard testimony regarding the so-called, not so-called, the aluminum shortage in 1955 and early 1956. [fol. 2219] I think they began to see the light in July of 1956; do you recall that?

A. I heard it.

Q. I think I am stating it correctly. Would you look at the years '55 and '56 and tell us what percentage of Alcoa's production was sold to non-integrated fabricators as against its use in its own production.

A. Well, in '56——

Q. Just taking two now, the dark line and the actual sales to fabricators. We are ignoring the exports and the inventory.

A. '56 was one of the years you asked about?

Q. '55 and '56 I asked about.

A. I will give you '56. The amount used by Alcoa was about 64 percent and the sales to other fabricators is about 23 percent.

Q. Right. I assume this is right. Now, in '55 what was it?

A. I have not worked that out.

Q. Can you work it out?

A. I will be glad to. It is over 20 percent.

Q. Now, in those two years, which are the years that have been testified to as the shortage years, isn't the percentage [fol. 2220] sold to non-integrated as compared to Alcoa's use in its own consumption far greater than it was in any of the other years that appear on that chart?

A. Yes, sales to fabricators in '55 and '56 were larger than, percentagewise, than those in the later years from '57 on through '60.

Q. And also the earlier years?

A. Perhaps they are. I have not——

Q. So that during '55 and '56, in the years of the shortage, Alcoa apparently cut back its own production in order to make aluminum available to non-integrated producers—on its own fabricating in order to make aluminum available to non-fabricators?

A. I wouldn't know.

Q. Doesn't the chart indicate that?

A. I wouldn't know whether they cut back their own production. All I know is——

Q. If there was a shortage year and they used a smaller percentage, it would seem to me to follow that they could have used it if they so chose, but it apparently is as Mr. Magee testified that they rationed themselves just the way they rationed everybody else, even to their detriment; isn't that true?

[fol. 2221] A. I don't know that.

Q. Doesn't that seem to be——

A. The chart indicates that there was less used by Alcoa in those particular years.

Q. In the shortage years?

A. Yes, that's right.

Q. And more made available, or more available to non-integrated, or more sold, let's put it that way, more sold to the non-integrated in those two years?

A. Well, perhaps in '55 or '54 it seems like a small amount went to fabricators.

Q. I am talking about percentages. Let's take percentages of '54 and the percentage—cut the chart off at the export line. Now, of the Alcoa production used in its own fabrication and of Alcoa production sold to non-integrated, what percentage was used by Alcoa in its own production?

A. In 1954?

Q. In 1954.

A. Roughly about 40 percent was used in their own facilities.

Q. In '54. I am just talking now about the dark part of [fol. 2222] the line and the little dots. The dotted portion. About 800 and——

A. I don't follow you, Mr. Bergson.

Mr. Bergson: Am I making myself clear to your Honor?

The Court: Yes, I can understand what you mean.

Q. What I am trying to ask you to give us is what percentage of this (indicating).

A. Yes.

Q. (Indicating) This much.

A. Yes.

Q. Was used by Alcoa?

A. That has all been used by Alcoa.

Q. No, in its own production, its own fabrication.

A. As in relationship to production?

Q. No; as in relation to these two (indicating).

A. Oh, I see. It is a little over 80 percent.

[fol. 2223] Q. Are you sure it is a little over? It is not more than a little? I think it is closer to 85.

A. I get about 82 per cent.

Q. Well, it doesn't matter. Now, make the same computation for 1955, because I am not sure you understood my previous question.

A. On the same basis?

Q. On the same basis, yes.

A. I'd say it's about 65 per cent.

Q. And would you make the same computation for 1956?

A. I get about 86 per cent.

Q. You get what? I think you better do that again.

A. I am not doing this under the best conditions.

Q. I don't see how 1955 can be 65 per cent and 1956 be anything but less than 65 per cent.

A. You are asking me for 1956?

Q. Yes, and just the ratio of this dark line and the dotted portion (indicating).

A. I see. I still get about 80 per cent.

The Court: It couldn't be. Look at your graph right in front of you. If in 1955 the production was 65 per cent used in its own by Alcoa, 1956 must be less than that. It has to be.

[fol. 2224] Mr. Bergson: It's got to be less than 65.

The Witness: Sure, it has. It is about one-sixth, sold to outside fabricators.

By Mr. Bergson:

Q. I hate to take up the Court's time, but I think you are wrong. If you are not wrong, your graph doesn't mean anything, because this hatch part certainly doesn't occupy one-sixth of the line from the beginning where the numerals 1956 are out to the end of the dotted part. It is so apparent on its face that either your figures are wrong or your chart is wrong. Don't you have to do this, don't you have to in order to make this computation——

A. (Interrupting) I am sorry.

Q. You have got to take the part used by Alcoa and you add to that, which in 1955 we were talking about, first used by Alcoa was 951,000 or 951,000,000, approximately, right?

A. Yes.

Q. And sales to fabricators, which was approximately 295,000,000, right?

A. Yes.

Q. Then don't you add those two together and divide [fol. 2225] the sales to fabricators by the total that you get to get the percentage sold to fabricators?

A. Yes, you are right. I was adding here. I didn't look across the sheet, and I was putting in exports and adding that to sales and coming out with a percentage.

Mr. Bergson: Do you wish me to take the time to do this, your Honor?

The Court: I think that it is apparent here that in the years 1955 and 1956, if I understand the chart right, there was percentagewise, there was more aluminum sold by Alcoa to non-integrated fabricators than there was in the years immediately preceding 1955 and in the years immediately following 1956.

Mr. Bergson: Your Honor, we have worked out these computations and we find that in 1954 Alcoa's percentage used in its own fabrication was 85.7 per cent; in 1955 it was 76 per cent; and in 1956 it was 73 percent. Now, do you want to accept those, Mr. Finn, or do you want to do them yourself?

The Witness: Well, I will accept them.

[fol. 2226] By Mr. Bergson:

Q. Now, starting with that as a premise, would you as an economist and as a statistician conclude that in the so-called shortage years of 1955 and 1956 Alcoa made more or less of its production available to non-integrated producers than it used in its own fabrication?

A. Yes, percentagewise they did.

Q. And also tonnagewise, that is apparent from the face of the chart?

A. Yes.

Mr. Bergson: Thank you. No further questions.

The Court: Redirect.

Redirect examination.

By Mr. Melchior:

Q. Mr. Finn, do you know whether or not the Government aluminum set-aside program was in effect in the years 1955 and 1956?

A. I am not too familiar with it, but I understand it was.

Mr. Melchior: That's all.
Mr. Bergson: No further questions.
The Court: All right.

(Witness excused.)

[fol. 2227] Mr. Melchior: Mr. Bernsten.

Bernard P. Bernsten, called as a witnes in behalf of the government, being first duly sworn, testified as follows:

Direct examination.

By Mr. Melchior:

Q. Would you state your name and place of employment?

A. Bernard P. Bernsten. I am employed in the industrial division of the Census Bureau, U. S. Department of Commerce.

Q. What position do you hold?

A. I am chief of the electrical machinery and transportation section of the industry division.

Q. How long have you held this position?

A. I have been in the section a little over two years; acting chief of the section starting in May last year and chief of the section beginning in June of last year.

Q. Now, in general what type of work does this position involve?

A. The direction of the collection, compilation and publication of statistics, economic statistics of the major groups [fol. 2228] which fall within the section; which are Major Group 19, ordnance and accessories; Major Group 36, electrical—when I use "major group" it is in the standard in-

dustry relation; Major Group 37; Major Group 38, Instruments and up until a couple of months ago Major Group No. 39.

Q. How long have you been engaged in the field of statistic analysis?

A. A total of a little over six years.

Q. What is your educational background, Mr. Bernsten?

A. B.A. magna cum laude and a Master's degree at Fordham University. I completed my Ph.D. requirements and I majored in economics and have taken courses including courses in statistics.

Q. Mr. Bernsten, I hand you government's Exhibit 498 for identification and ask you if you will identify it.

A. This is a release put out by the Census Bureau last October 19th in our current industrial report series. It covers the shipments, quality and volume of shipment of wire devices and supplies in the year 1960.

OFFERS IN EVIDENCE

Mr. Melchior: I offer government's Exhibit 498 for iden-
[fol. 2229] tification at this time.

Mr. Bergson: No objection.

The Court: Received.

(Government's Exhibit 498 for identification received in evidence.)

Q. Now, Mr. Bernsten, do your responsibilities include the assembly of information which is compiled in this report?

A. They do, sir.

Q. Now, is there a form used in the collection of this information by the Bureau of Census?

A. There is, sir. Census form MA-36-K.

Q. I hand you government's Exhibit 499 for identification and ask you if this is the document?

A. Form MA-36-K.

Mr. Melchior: Your Honor, we don't have an extra copy of this.

The Court: This is the instruction sheet; is it?

Mr. Melchior: Yes, sir, this is the instruction sheet.

The Court: All right.

Mr. Melchior: We will interrogate the witness about it.
[fol. 2230] The Court: All right.
Mr. Melchior: I offer government's Exhibit 499.
Mr. Bergson: No objection.
The Court: Received.

(Government's Exhibit 499 for identification received in evidence.)

By Mr. Melchior:

Q. Now, directing your attention to government's Exhibit 499, Mr. Bernsten.
A. Is that the form, Mr. Melchior?
Q. That is the form MA-36-K. Does this form include categories, product categories of electrical conduit and electrical fittings?
A. Yes, sir, it does.
Q. Would you identify the product categories by their code numbers?
A. Yes. The inside of the form toward the lower portion under "'Non-current carrying wire devices——"

Mr. Bergson: Mr. Melchior, excuse me. We have an extra copy for the Court.
Mr. Melchior: Fine. I appreciate that.
[fol. 2231] The Court: All right.

A. Under "non-current carrying wire devices," Code 36442, the general code and class of products electrical conduit and conduit fittings is category "Rigid Conduit (standard weight) including couplings, nipples, bends and elbows." Under that, under Code 3644221 is indented the category "Steel."
The next code, 3644222, indented directly under steel, "Other." There is another heading which would be under where we begin rigid conduit, this is electrical metallic tubing (thin-wall conduit), including couplings, nipples, bends and elbows.
Code 3644223, identation, "Steel."
3644224, indented under that, "Other."
There are a couple of other categories. Shall I go into all of them under the general head "Electrical conduit and conduit fittings" or only these four?

Q. Let me ask you this, Mr. Bernsten, as I read this form the field of rigid conduit is divided into two groups. One is "steel" and one which you categorize as "other"; is that correct?

A. That is correct, sir.

[fol. 2232] Q. Would all steel conduit be included under the "steel" category?

A. It would, sir.

Q. What would be included under the "other" category under rigid?

A. All other metallic non-steel rigid conduit.

Q. All metallic conduit?

A. That is correct.

Q. Would this include aluminum rigid conduit?

A. Presumably, if rigid conduit is made of aluminum, it would be classified "other." All aluminum and any other non-steel metal.

Q. That's right. Now, your next broad category is EMT, which is electrical metallic tubing.

A. That is correct.

Q. And I see you have a dual breakdown there, "Steel" and "other".

A. Similar to the other.

Q. Would all steel electrical metallic tubing be included under the heading of "steel"?

A. Yes, sir, it would.

Q. And what would be included under the heading of "other"?

A. All other non-steel electrical metallic tubing.

[fol. 2233] Q. And would this include aluminum electrical metallic tubing?

A. Yes, it would, presumably yes, all other non-steel metals.

Q. Now, I notice there are other categories listed below that such as flexible steel conduit, raceways and raceway fittings and so forth.

A. Yes, sir.

Q. Now, I ask you would any rigid steel conduit be included under any of these other headings properly?

A. No, sir, they would not. Under the product distribution there is only one line for "steel rigid conduit," and that is under Code 364421 previously mentioned.

Q. Would any other rigid metallic conduit be included under any of these other categories?

A. To use your word before, "not properly." There is only one line for the 3644222.

Q. With respect to EMT steel conduit, would any of the EMT steel conduit be properly included in any of these other headings?

A. No, sir.

[fol. 2234] Q. Now, how about any other EMT metallic conduit, would any——

A. There should not be other than for Code 3644224.

Q. Now, is the submission of this report required by law, Mr. Bernsten?

A. Yes, it is mandatory under provisions of an act of Congress 13 U. S. Code, and is so stated on the cover letter which went with this report, such as states "The inquiry is authorized by Act of Congress 13 U.S.C. 18, which requires that you submit this report."

Q. Are there penalties involved for non suppliers of this information?

A. There are, but I could not tell you exactly what they are.

Q. Now, Mr. Bernsten, would you generally describe the studies the Bureau of Census utilizes to insure that the information submitted in government Exhibit 499 is complete, and that the coverage from a company standpoint is complete. General description, if you will.

A. All right. As with any so-called complete coverage Census survey, I use the term because in some areas we use [fol. 2235] just sample techniques and inflate for establishments which we do not cover. This is not one of these, this is a complete coverage survey. In a complete coverage survey such as this we use as a source of our current list of respondents first of all the prior complete Census of Manufactures for the commodity specifically covered on the survey form. Number two, we of course realize that between the quinquennial Census of Manufactures other establishments, we call them births, could come into the manufacturing field.

We therefore check, by taking the records of the BOASI, Bureau of Old Age Survivors Insurance, by law anyone who employs one old age employee must pay a social se-

curity tax and they file with BOASI in Baltimore. They file a description as to what types of commodities, what type of business they are in—excuse me—what type of business they are in. And BOASI uses the same classification system as the Bureau and others do. The Budget Bureau, standard production classification annually. They will assign to the establishment a four-number code based on their business activity. The second of this survey would therefore follow, [fol. 2236] and anyone would be coded 3643, current carrying wire and devices, or 3644, non-current carrying wire and devices. In addition to which we use other readily available lists of manufacturers. For instance, we use Dun and Bradstreet and Thomas's Register.

This is pretty much—well, we are human, we do everything humanly possible to make sure that we have everyone who is classified as a manufacturer within the scope of such a manufacturing survey.

[fol. 2237] Q. I see. Now, you stated, I believe, that finally you checked the previous census of manufacturers as a starting point?

A. That is correct, sir.

Q. When was that?

A. 1958, covering the year 1958.

Q. Now, directing your attention to Government Exhibit 499, which is your form MA36K, your reporting form?

A. Yes.

Q. Would you state in a general fashion the manner in which this form was prepared?

A. Yes. This survey on wiring devices and supplies, which is now a part of a continuing Census Bureau program in our current industrial report service, was initiated to cover the first year, 1960, the types, the classifications of the products to be covered were essentially covered in the same manner in the complete census of manufacturers, so we began by using as the basic product stub, if you will, the same information which we had collected as part of the census of manufacturers.

Then as the Standard Bureau on Procedure, since we are solely a publisher of statistics, we are not analyzers or [fol. 2238] users of statistics, therefore we went to people who are the major users of this type of data, in this case it would be manufacturers and manufacturing associations,

together with pertinent government agencies, we went over the proposed form, both by mail and in person—I don't know whether I should use the term meeting or meetings, there was at least one meeting with industry representatives and at least one with government representatives. Suggestions were given to us as to what type of data should be collected over the data collected in 1958 and I believe it can be noticed that in the current industrial report, the published figures, the results of the collection of the data on this form, you can see there were in some cases expansion of categories as against that which was collected in the census. As a matter of fact, the items on conduit are some in point. I believe what we had originally done on collecting the data on conduit, we either just collected all conduit or perhaps just rigid and electrical metallic tubing, but on the advice of users we attempted to get a break in 1960 between steel and other on both rigid and EMT.

[fol. 2239] After we received the pertinent comments of industry and government users, incorporated those, it was felt we would have a fairly good chance of collecting and publishing meaningful data. As is required by law we submitted the report, the proposed report form to the Bureau of the Budget, which, of course, must approve any such product. There is an office there of OSS, Office of Statistical Standards, within the Budget Bureau, which gave final approval and we initiated collection of data for 1960.

Q. I take it quite a bit of work went into the preparation of this form?

A. As with any form, yes.

Q. As with any form of the Bureau of the Census?

A. Yes.

Q. There were consultations with industrial members?

A. Yes.

Q. Did you consult with BDSA?

A. Yes, this is the Business and Defense Service Administration, another agency within the Department of Commerce.

Q. Did the Bureau of Census consult on this form with [fol. 2240] the National Association of Electrical Manufacturers?

A. You mean NEMA?

Q. Yes.

A. Yes, we did.

Q. There were representatives at meetings you held on this particular form?

A. Yes, sir.

Q. Now, Mr. Bernsten, let me ask you this, what is the view, if you know, of the Bureau of Census as to the completeness of its coverage of respondents with respect to the submission of GX-498, which is the wiring devices and supplies report?

A. Well, I am not sure I am clear on your question. Respondents give us 498.

Q. 499.

A. Respondents submit the form.

Q. Yes.

A. Well, not anticipating this question, but I attempted to give a full explanation before of what we do to insure complete coverage. We checked all available records of manufacturers of these products, and we feel that we have them all. As you know, the Director of the Census Bureau in response to a request, wrote a letter to you on February [fol. 2241] 13, and I can no better state it really than what he put in that letter, namely——

Q. (Interrupting) Would you read that into the record?

A. "We are satisfied with the results of the survey and are convinced of the reliability of the figures we have published as revised in the Bureau's letter of February 1."

This, of course, is specifically in reference to the figures as published as to the coverage, again within the realm of possibility, it is not devine revelation or infallibility, but within the realms as is humanly possible, we feel we have complete coverage of all manufacturers of wiring devices and supplies as defined within the scope of the Census of manufacturers.

Q. Now, do the figures contained in GX-498, with particular respect to the electrical conduit figures, include exports?

A. Well, if I may answer it sort of indirectly, sir, if there were exports of any of these items in 1960, they should be included here. Our figures that we collect are quantity and value of shipments f.o.b. the factory, regardless of the final [fol. 2242] destination. If the manufacturers either directly exported or shipped directly to an exporter, it is the

same as if it went to any commercial establishment, they should be included within these figures here. There is no way of our knowing whether there are any exports, because, as you note, the form simply asks for total quantity and value of shipments. We did not attempt to break out exports.

Q. And do these figures include interplant transfers?

A. Same answer as before, in fact the form says, "Total shipments including interplant transfers." Again we have no way of knowing whether any of the figures on the form, not only conduit, any of the wiring devices figures were shipped between manufacturing establishments of the same company. If they were, they again should be included here.

Q. What is an interplant transfer, Mr. Bernsten, if you know?

A. Let's put it this way, I don't think we directly give a definition. We use what we term standard industry terminology, but our understanding would be a shipment of a product which we are collecting as such on the form, which [fol. 2243] one company would have to be what we call a multi-unit company, a company that has two or more establishments, and it would be shipments of this commodity from one establishment of the company to another establishment of the same company.

Q. And would the product shipped require further processing, if it required further processing, would it have to be included in that category?

A. Not necessarily. The distinction which is made is as to how we request the second establishment, the recipient of the commodities to report, namely—well, part of this, I am an economist and statistician, I am not an electrical expert, but commonsense tells us as to the type of commodity included. For example, something which when it leaves establishment A's door is complete, is usable and is usually used in its form it is in when it leaves that door, if for some marketing purpose they ship it to another establishment of the same company and that company does not do any further manufacturing—he may put it in a package, but we tell the respondent in the report form, this is not assembly, this is not manufacture, if the manufacturer re- [fol. 2244] sells that without further manufacturing, in the total Census of manufacturers, we have a separate line for

re-sales, it is not included in the commodity table in this form here, because we are only interested in commodity detail, not in these general statistics.

The establishment of that company should not report those when he resells them.

On the other hand, if there is further manufacturing, usually speaking, what establishment "A" will report to us may be some part, let's say, which perchance happens to be collected on the same form, if establishment "B" does further processing, usually speaking, when he reports it is on a different line where it has reached a further stage of fabrication, but there are some industries where this makes more sense than in others. I understand in the metals area where somebody sends a casting and somebody else does further fabrication, as far as wiring devices and supplies, I would have no way of knowing whether this would be true or not.

Q. You don't know whether conduit received further processing, you wouldn't know that, would you?

[fol. 2245] A. It depends on what is meant by conduit. If it is conduit, I am not sure what else you can do with it—more conduit?

Mr. Melchior: No further questions. You may examine.

Cross-examination.

By Mr. Bergson:

Q. Mr. Bernsten, would you please look at Government Exhibit 499, which is the reporting form?

A. Yes, sir.

Q. And particularly at those sections relating to the reporting of conduit?

A. Yes, sir.

Q. The form requests a report on rigid conduit, including couplings, nipples, and sets forth—then it breaks it down into steel or other, or electrical metallic tubing, is that right?

A. That is correct.

Q. If you were a manufacturer of aluminum conduit, in which line would you report your aluminum conduit?

A. Well, depending on what kind of conduit it was.

Q. Not electrical metal tubing, but rigid aluminum conduit.

[fol. 2246] A. If it were rigid aluminum conduit it should be reported under Code 3644222, "Other;" if it were aluminum electrical metallic tubing, it should be reported under 3644224, the other line there.

Q. Now, I also notice that you have a classification Code No. 3644236, entitled "Other Electrical Conduit;" what type of conduit, if you were reporting, what type of conduit would you report in that form?

A. Now, let me put it this way. The question, of course, is hypothetical, and I am not in a position as a Census Bureau employee to give a hypothetical answer.

May I backtrack a bit to give you some information?

Q. Yes, all I want to do is clarify it.

A. That is what I am here for. As any Census Bureau employee, as I believe I brought out on direct examination by Mr. Melchior, we are not experts in any commodity field. We cannot be. As I explained before, in my own work there are 95 separate industries with a couple of thousand products and it is a physical impossibility to be an expert. The preparation of a report form is something where we really—[fol. 2247] I will say almost exclusively, we must have some working knowledge of the products with which we deal, but we really almost exclusively rely on the manufacturers of the product involved and the users of the statistics to give us what is the general industry terminology and its best description of the items to be collected.

Now, if you asked me what is included under "Other," the only thing I can do, and without trying to be smart or anything else, is to refer to the report form which, since it was given to us by manufacturers representatives, we must assume has a definitive meaning to the manufacturers, namely, that it includes underground conduit and fitting, molding angles, molding outlet and molding junction boxes.

Q. That says "including," that doesn't say "only"?

A. That is correct. Anything in a parentheses is meant to be—to give an example, an e.g. sort of thing. That is true, it doesn't say "only," I will admit that, but you asked before about rigid conduit. Now, there are two lines for rigid conduit. There are two lines for electrical metal tubing. [fol. 2248] Now, I wouldn't even attempt to tell you whether

there are any other types of conduit—well, there is at least one other, "flexible steel conduit," I see there is a line for it. Perhaps there is semi-flexible tubing, as far as I know, that would belong in line 236, but a respondent should not, if he is making electrical metal tubing, I can't see on what basis he could justify—well, put it in 236.

Q. Do you think a manufacturer of conduit other than steel, rigid conduit other than steel, would be in violation of the law, for example, if he reported conduit other than steel under "Other electrical conduit"?

A. Depending on the reason for his doing it. The law states—I am not a lawyer and I don't have the code in front of me, but the law does state, No. 1, that the Respondent cannot refuse to report, because it is mandatory, 2, nor can he deliberately give false or misleading information. As I tried to bring out before, maybe I wasn't clear here, the same as we are fallible in our attempt to gain complete coverage of the materials collected here on this form, it [fol. 2249] must be assumed that a respondent is fallible too, and could make a mistake.

Q. I think you or Mr. Melchior used the expression "not properly included"?

A. That is correct. If I may just continue, for example, if someone did not wish it known that he were a manufacturer of one of these products, full well knowing he could hide his figures by burying it in "all others," this, I will rely on your honor, could be interpreted as deliberate disobedience of the law, but if someone looks at the two lines and perhaps says "I am not sure which one it goes in, I better put it in 'All others'," we do specifically say to please contact the Census Bureau if they don't understand it.

Q. But there is a possibility it might not properly be included for perfectly innocent reason?

A. That is correct.

Q. And I assume that is why you very carefully qualified your statement by saying "not properly"?

A. That is correct.

Q. Now, when the Census got this information it published the current industrial report for wiring devices and supplies for 1960?

[fol. 2250] A. Yes, sir.

Q. Which is Government's Exhibit 498, right?

A. Yes.

Q. And when the Census published that report, it didn't do what it instructed the reporters to do, did it?

A. What did we instruct the reporters to do that we didn't do?

Q. You instructed the reporters to include, according to your testimony, rigid aluminum conduit in the "Other" category from steel under rigid conduit, is that not right?

A. Not specifically aluminum, we told them "all."

Q. All conduit, but where did you report in the current industrial reports aluminum rigid conduit?

A. We do not report, we publish and by law we are specifically——

Q. (Interrupting) It is called a report and I assumed that it meant what it said.

A. This is more of a technical difference involved, namely, we tell the respondent where to report. Their reporting of figures is based on their honest and best knowledge of which of the figures of which of the commodities they have made in [fol. 2251] quantity, where asked for, and the dollar value in all cases that we ask. We publish the data along the exact same lines. If you will notice, if you have taken the time to check——

Q. (Interrupting) I have.

A. The product stub here is pretty much the same as the product stub as collected on the report form. We published —not reported—published a figure on steel rigid conduit. We have published a figure on steel electrical metallic tubing; we have combined, not that we didn't report it correctly, we have combined the figure on "Other rigid conduit," and "Other metallic electrical tubing," because we are governed by different laws than that of the respondent. The law that governs him, he has to report to the best of his ability. We have another part of the law which says we are prohibited by law from disclosing the operations of individual companies. We had a disclosure on one of the two lines. If we were to publish the figures as reported there was a reasonable chance to pick up the files and say, "XYZ" or "ABC," or "DEF companies made this amount in one of the two lines." We had a choice, we could either withhold [fol. 2252] the figures entirely—but we are not in the business of not publishing figures, we are in the business of pub-

lishing them, or we could combine the figures to at least give market analysts an opportunity to see what the total market of these products were. Therefore, we combined other rigid conduit with other electrical metal tubing, there was no disclosure in the combined figure, and yet we have given a total quantity and value figure. You can add the dollar figures and get the total figure. You cannot get a separate figure on other rigid or other metal tubing because of the disclosure provisions of the law.

[fol. 2253] Q. So as a result aluminum conduit went into electrical metallic tubing rather than in rigid, where you asked for it?

A. No, no, no. It is not in. That figure that you see below —we are talking about two entirely different figures. Let's stick to the dollar figure of 16 million——

Q. I am not talking about money. That is too prosaic to discuss. I am talking about reporting and publishing.

A. We seem to be talking about the same thing.

Q. As I read this form——

A. Report.

Q. —this report which you published, I think you asked for aluminum conduit.

A. We did not ask for aluminum conduit.

Q. Aluminum rigid conduit.

A. We didn't ask for aluminum rigid conduit.

The Court: Wait a minute, witness.

Let's get a question down.

Q. You asked that aluminum rigid conduit be included within other aluminum conduit fittings and rigid conduit; did you not?

A. We asked for non-steel metal to be included.

[fol. 2254] Q. And that includes aluminum, does it not?

A. That is presumably correct.

Q. When you published the figures, however, you published the aluminum rigid figures in a different category; isn't that true?

A. No, sir.

Q. Well, where are the aluminum rigid conduit figures?

A. They are combined with the electrical metallic tubing.

The Court: That is just what he asked you.

The Witness: Well, he says where—maybe I misunderstood the question. We put the footnote in 5 and combined it in EMT. We could have done that the opposite way and put it under other rigid conduit and stuck footnote 5 under EMT. We could have put the footnote on both of them and put the whole figure in that footnote.

Q. You are quarreling with my terminology?

A. I am only familiar with the Census Bureau terminology, not with yours.

[fol. 2255] Q. Let me ask you this, where in the current industrial report is rigid aluminum conduit?

A. It is combined with other electrical metallic tubing.

Q. Now, where was it asked for in the request that you sent out?

A. It was asked for in a separate line by itself, as was the other one.

Q. It was asked for, was it in under rigid conduit steel or other?

The Witness: Your Honor, may I direct a statement to you?

The Court: No, you don't need to. That has been asked and answered five times.

The Witness: That is so, that is what I believe too.

The Court: Then why don't you say so, just say yes.

The Witness: Well, as a Census Bureau employee I am interested in the Court's understanding of what we have done. May I direct something to you?

Mr. Bergson: Sure.

The Court: Yes, but when we get right down to it we can [fol. 2256] get down to a very simple proposition. The difficulty I have is locating rigid aluminum conduit. Well, now it is very plain and I don't see why there is this long harrang-e.

The Witness: I think——

The Court: Now, wait a minute. You asked for it under rigid conduit.

The Witness: Yes.

The Court: And with this report it is combined with something else so that I can't get it. That is what he is getting at.

The Witness: That is correct.

The Court: There is nothing very complicated about the whole thing as I can see it that requires a lot of explanation.

By Mr. Bergson:

Q. Now, I ask you whether this is not possible in view of the way Census handles these figures, and please believe me that I am not trying to impute anything sinister to the Census and you don't have to defend Census when I ask you this [fol. 2257] question—is it not possible that aluminum conduit or aluminum EMT might possibly have gotten into other electrical conduit on a perfectly innocent basis both on the part of the reporter and on the part of the Census?

A. I answered the question before and answer it again, yes, it is perfectly possible. Not properly so, but possibly so.

Q. I think you said before that they were pretty much accurate is the quote I have.

A. That is correct.

Q. But it is possible that it is erroneous. Now, let me ask you this, the sum, the value that you have for 1960 under this category "other aluminum conduit", which includes ells and junction boxes and so forth, do you have sufficient knowledge of the industry to know that if you exclude all electrical conduit from that total that there would be as much dollar volume of sales of these products to reach the total of 53 million dollars?

A. We have no way of knowing because we collected it as a total figure. We have no way of knowing what portion of that is any of the figures, is any of the products included within the parentheses.

[fol. 2258] Q. You said also that in preparing this reporting form you discussed this form with representatives of NEMA.

A. That is correct.

Q. Do you recall how the form came about, I mean this special industrial report came about?

A. As I recall, we were specifically requested by the National Electrical Manufacturers Association to institute a current program in the wiring devices and supply field.

The Court: Take a short recess.

(At this point a recess was taken after which the trial was continued.)

By Mr. Bergson:

Q. Mr. Bernsten, are you familiar with the term "basket category" as referred to in Census statistics?

A. Yes, in the sense that I heard it. We do not use it ourselves, but others have. It usually applies to a category wherein the product will appear the word "other" or "all other."

Q. Would you consider this other electrical conduit category on current industrial report, government Exhibit 498, to be such category?

[fol. 2259] A. I repeat, we do not use the term "basket" but this would be, I think I can truthfully say, the type of category that those who use the statistics apply the category.

Q. The amount involved in the category is somewhat over 53 million dollars.

A. Fifty-three, two hundred and forty-one for 1960.

Q. Isn't that an unusually large amount to have in a category of that kind?

A. No, sir. May I make one point?

Q. Yes.

A. If you will notice the fifty-three, two forty-one is a combination of two lines.

Q. Yes.

A. One the "other electrical conduit." The second line being the "fittings" line.

Now there is a disclosure problem again here, and if you will notice here since the two lines one immediately follow the other, we used a different technique than we previously used. Here we simply use a bracket to show the two figures together. This is a technique we would have used earlier if the disclosure even had been the same thing. We have [fol. 2260] no way of knowing how much that 53 million is, as you term "basket" as against the fittings figure. Even taking the two combined, now this 53 million, we would compare that generally speaking, sir, with the figures within the same class of products, namely the electrical conduit and fittings. Roughly we have 83 and 27, about 110, 126, 142, 152, out of a total of over 200 million dollars some portion

of 53 million is the basket "other." And I repeat I use the term "some portion" because it has fittings which go with the conduit. This would not be an abnormally large figure.

Q. This is just to clarify my own thinking on this line. Electrical conduit and fittings NSK, is that included within the products?

A. No, the three dots are standard Census symbols for this—may I give an explanation?

Q. Yes.

A. Basically the explanation is in footnote 3, which is on the '58 data. Perhaps this is not entirely clear in the complete Census of Manufactures where we have canvassed every known manufacturer, the Census form does not only deal with commodity data as before, but all different types [fol. 2261] of data, such as employment size, man hours, production workers, wages, materials semi-metallic workers, operation et cetera. It is a rather large form and a detailed one. We have found through consultation and advice of users and different manufacturers who must supply the data and other government agencies, that there is a question that the large form imposes somewhat of a burden on very small manufacturers because of their limited facilities. In addition to which the amount of detail which they can report, generally speaking, because they are so small is not going to add anything which is statistically significant to a separate line item. So what we do, we know what industry they are classified in through the BOASI records. We send them a so-called Census short form. This form is only one page. The form will just list total employment without getting a detailed breakdown by quota of production workers for example. It will list the classes of products he makes. For example, he can put down that he makes so many thousands of dollars of electrical conduit. The term "NSK" is a short form "not specified by kind."

As you notice for that whole class of products, for the [fol. 2262] year 1958, the short form respondent amounted to five million dollars, as the footnote says, these products reported as NSK by small establishments which did not have an opportunity to report in detail the statistics required of larger establishments because they didn't receive the form with all the many lines on it.

However, when we go to an annual commodity survey, in

our current industrial report series, where only information we ask is commodity data for these other statistics, we feel that it is not a burden on him to put on the proper line his dollar value. Therefore, going backwards, in 1960 these smaller respondents didn't have an opportunity to report NSK. They had to put their figures on the specific lines. Therefore, for comparison purposes of the whole class of products, the NSK is necessary to show in '58 when you attempt to compare the figures of '58 and '60.

However, there are other NSK categories and you will notice all of them have the three dots for 1960. Their figures are distributed within the category.

Q. I think you testified that among the trade associations [fol. 2263] that you consulted in regard to this form—what is it?

A. MA-36-K.

Q. MA-36-K, was the National Electrical Manufacturers Association.

A. That is correct.

Q. Do you know whether or not you discussed with them the conduit portions of the form?

A. At the meeting, a joint meeting held between the Census Bureau and representatives of NEMA, the question of the whole proposed report form including the lines on conduit as well as every other line, these questions were brought up. Just drawing from memory, I do believe at the meeting the Association said that there was no one present at the meeting from their association—the words were something like "who felt competent to comment at the fiscal meeting on the particular lines"—they did say, however, that in time for us to submit the report form to the Bureau of the Budget they would comment one way or the other in writing. And then after that a letter was received, I believe signed by Mr. A. J. Nesti, who was chief statistician of NEMA, to the effect that they had no objection to the other [fol. 2263a] sections of the form which were not specifically discussed at the meeting.

[fol. 2264] Q. The other section of the form?

A. Yes. I believe not only was conduit an area where the NEMA representative did not feel competent to discuss with us, but I believe there were one or two others. But from memory, I don't remember exactly what it was,

and when we had asked for the joint meeting, it was specifically for the purposes of discussing the whole form. As I recall, through some—I don't know what it was, we sent them a copy of the proposed report form which included conduit and other areas, but I think someone read the letter without referring to the report form we sent them and the explanation we got, and I believe they misunderstood, they saw wiring devices and didn't realize it included everything in wiring devices, which appears to mean they didn't look at the form we had attached to the letter.

Q. Do you know whether or not there were any changes on the form after that meeting?

A. The differences in the form between 1958 and 1960 I could not pinpoint as to where they came from. There were differences, as I pointed out before, in conduit, namely, for 1960 we were requested to break out steel and "other" [fol. 2265] for both rigid and EMT. I believe these suggestions were made by BDSA, the other government agency I referred to before.

Again, if my memory serves me as to NEMA not specifically commenting at the meeting on conduit the changes in conduit did not come about as part of their review, obviously. I believe there were one or two other changes in the report, but as to whether they were specifically NEMA recommendations, those details I don't have, and that detailed a set of notes we don't keep.

Q. Did the Census publish statistics for conduit in 1958?

A. Well, at the risk of getting into a misunderstanding again, let me say yes and no. We collected conduit figures, we had a disclosure problem and we combined them with an "all other" category. It is included but not as a separate line. Does that answer your question?

Q. There is no publication of conduit figures.

A. If I can just look to make sure—that's correct, I see in the Footnote 4—I take that back, there were figures on conduit. For example, the flexible steel and the raceways, [fol. 2266] there were no figures on the rigid or the EMT, which were more in discussion, no separate figures, that's correct.

Q. Now, Mr. Bernsten, you said you get your information as to companies from the Bureau of Old Age Survivors and Survivors Insurance, among other sources?

A. That's correct. This is mainly a check on existing mailing lists.

The Court: Yes, he did. Go ahead.

By Mr. Bergson:

Q. If a company were listed at the Bureau of Old Age Survivors, or on your previous Census forms as an extruder of aluminum shapes or aluminum pipes, would he necessarily get a form for conduit?

A. Not necessarily. May I expand my answer?

Q. Certainly.

The Court: Yes, but don't make these explanations so long. These questions are rather simple.

The Witness: There is a chance the answer might not be as simple as the question. In these types of surveys, these are commodity surveys and we are therefore interested in collecting data on people who specifically manufacture items [fol. 2267] line by line. Therefore, it is not just a man's classification as to what he does as a major product, but does he specifically manufacture items here. For example, when we went to the Census list we have line by line anyone who manufactures any of these products in the 1958 Census, whether that man was primarily a wiring device manufacturer or an aluminum extruder, if he made these even as a second product, we got him. But as an extruder of aluminum, I think somebody mentioned 34, as such, he doesn't necessarily get one. If he reported to us he shipped conduit, he would get a form.

Q. If a man reported to Census or a company reported to Census as an extruder of aluminum shapes or pipes for the 1958 Census, and sometime between 1958 and 1960, began to fabricate aluminum conduit, would he necessarily get one of these MA36K reports?

A. If he was selected in the supplemental annual survey of manufacturers, where again he has to put down his specific class of products, and we match the annual survey against the reporters on the commodity survey, yes; if he was non-select in the annual survey of manufacturers, no.

[fol. 2268] Q. Supposing in the annual survey of manufacturers he said he was an extruder of aluminum pipe.

A. This is not what he would say. There is a specific product section. He gets a book with an alphabetical listing of all products, and a code to put down in a specific item on the annual survey. Any extrusion of aluminum would have a code of thirty-four something. If, in addition, say, 1959 or 1960 or 1961, he looks and he sees "conduit," he would put down "conduit," and it would have the code 36442. Or he might not even put down—some people only put down "conduit," and neglect to put in the code; some only put the code and neglect to put the description, but we match it.

Q. If, in the 1959 report, he just said, didn't say conduit because he wasn't manufacturing conduit in 1959, would he get the 1960 request?

A. Going back over your other assumptions, no, he would not. But if he then in 1960 would——

The Court: You don't need all of that, Witness. The question was a very simple one. He would get it. What is your opinion? Your opinion was no.

[fol. 2269] The Witness: That is correct.

The Court: All right.

By Mr. Bergson:

Q. And I suppose the same would be true of a fabricator of steel pipe?

A. That is correct.

Q. Now, Mr. Bernsten, would you tell the Court—I don't want you to violate any disclosure problems that exist under the Census Act, and I don't want to embarrass you or myself by asking that kind of a question, but in the current industrial report, which is Government's Exhibit 498, which was released on October 19, 1961, you had a figure for conduit and EMT which totaled $120,367,000. This is the total in Government exhibit, the conduit, is that correct?

A. We did not publish subtotals. It looks like that figure would be correct, sir.

Q. Right. Now, subsequently, on February 1, 1962, by letter from the Director of the Census to Mr. Loevinger, the Assistant Attorney General, which is Government Exhibit 496, you increased the total to $125,707,000; how did that

come about, not the exchange of correspondence but how did the increase in numbers come about?

[fol. 2270] A. Well, correspondence has something to do with it, because there was a prior letter from Mr. Loevinger explaining these figures, the original ones would be entered in as evidence and asking whether there would be a possibility of any revisions. This is important, because normally——

The Court: How did the change come about, is the only question.

The Witness: As a result of the request made by Mr. Loevinger, we, ahead of time, made a review of the report submitted on 36K, against reports submitted on the annual survey of manufacturers that we described before, and made the check against the BOASI record and in so doing we noticed a combination of discrepancies in figures reported to us on the one survey as against the other, and the two should have been the same, plus people from BOASI listed people as having come into the production, at least in the general industry, and we initiated telephone correspondence, verified in one case the change in figures. In the other cases, these people were now in and subsequently we [fol. 2271] sent by letter what these figures would be.

Q. Did the Department or Mr. Loevinger indicate there was any need for haste for getting these figures in?

A. Well, his letter says: "Specifically the Government has used these totals, since the Government is relying on these figures in this litigation and since the trial of the case commences on February 5—" his letter is dated January 30, by the way, "We would appreciate your advising us as soon as possible whether the figures for the value of shipments of these products have been revised subsequent to their publication in 1961, and if so, the changes which have been made."

Q. You had already told him orally, or had you already told him orally, in response to their oral request you had checked and found certain revisions were necessary?

A. I hadn't, I am not aware of anyone at the Bureau having done so. I believe it was only by letter, sir.

Q. Is it possible that in the haste to meet the February 5

deadline, that you might not have picked up all the dis-
[fol. 2272] crepancies that there were?

A. That was a possibility, but subsequent to that we have rechecked at our leisure and the figures are as reported, as revised in the letter.

Q. And this at your leisure was reaffirmed in the letter of February 13?

A. That is correct. I believe the letter specifically indicates the company accounts published there refer to the revised figures.

Q. And it refers to reports received from all known producers?

A. That is correct.

Q. Now, I suppose that was put in against the possibility that there might be some unknown producers?

A. I believe it was worded that way because it is standard terminology. Obviously, we can only have reports from all known producers.

Q. Now, Mr. Bernsten, is there any way without running into the disclosure problem of taking the Census total of 125,907,000, which is the amount now referred to in the Government Chart 455, and breaking out of there into plant transfers, foreign shipments or "Other"?

A. No, sir. The problem is not disclosure, the problem is
[fol. 2273] simply the figures as collected were total shipments. We did not ask for a breakout of interplant transfers.

Q. Would you have any way of knowing whether the total of interplant transfers, foreign shipments and other factors would result in a difference of, say, eight to ten million dollars in the Census figures?

A. No, sir, no way. If we don't have the figures on the exports specifically of these products or the interplant transfers, there is no way to do it, and we don't guess.

Q. Mr. Nesti, to whom you have referred, testified that NEMA figures did not include interplant transfers, foreign, and when I say "Others" I mean sales within an organization, was $116,697,000 for those companies reporting to NEMA. If those figures—and he said that those figures were incomplete because there were companies that did not report to NEMA—if you broke out interplant transfers or foreign shipments, other shipments from your Census total, and you came close to the 116,000,000 of NEMA, would you

as a statistician—is that your profession—say that the census figures would be subject to the same infirmity that [fol. 2274] the NEMA figures would be subject to?

A. Two points, one, I am not in a position to comment upon NEMA statistics; number 2, I was called as a witness for the Census Bureau, not for my own personal opinion. As a Census Bureau employee, again we will stand behind the figures that we published. Mr. Nesti, if he wishes to downgrade his statistics, that is his province. Whatever our final figures would show, and this is reiterated in the letter, we have confidence in them and we stand behind them. We feel that they are the best and most complete coverage possible of the items in question, no matter what the figures show.

Q. The best you are able to do under the circumstances?

A. Best as the largest statistical collecting agency in the world is able to do, yes, sir.

Q. Now, is this the first year, this 1960, the first year that the current industrial report was published for wiring devices?

A. Published in 1961 covering 1960, yes, sir.

Q. Is it customary or do you find in the performance of your duties that when you put out a new reporting form that you don't hit it right on the head the first year?

[fol. 2275] A. No more so than a survey that is being conducted for ten or twenty years.

Q. You feel you have as accurate results when you first start a new survey as you have after you have had the survey in effect ten or twenty years?

A. Yes, because the same care is taken to insure the complete coverage of respondents. We try not to get careless with one that is running for twenty years and we are as careful about a new one.

Q. Don't you find over the years that on occasions industrial representatives have pointed out discrepancies and that you have adjusted for those discrepancies?

A. I do not recall ever a discrepancy as such pointed out. As I pointed out before, I have only been with the Bureau a little over two years, but from reading through correspondence in the Census Bureau, I don't recall the Census ever revising a figure because a respondent has said the figure has been wrong. We have in our careful review re-

vised figures, but again, even though this is true and we are willing to state it for the record, there is no ratio that is higher on the first year than it is on the tenth year.

[fol. 2276] Q. Didn't you find a five million dollar discrepancy in this year?

A. We did not find a five million dollar discrepancy. As I pointed out before, the review of this was done earlier than would be normal Census procedure because of the request. This would have been picked up and published as part of the 1961 report, because this same careful review would have taken place in preparation for the 1961 report where we also show 1960 data revised when necessary.

Q. Getting away from the conduit now, how are industry classifications set up, are they set up in consultation with members of the industry?

A. Yes. Here I can only give you some hearsay. The Standard Industrial Manual, the product of the Budget Bureau as such, which consults with all users of statistics and all producers of statistics.

Q. And the statistics are furnished for the benefit of manufacturers in the conduct of their business, among other things.

A. Yes.

Q. And if they are interested in having particular things [fol. 2277] broken out, they will be broken out provided no disclosure problem is involved; is that right?

A. If feasible within the resources of the agency providing the figure. We will not simply because someone requests us to break it out, break it out. We have to have some evidence that the effort involved in breaking out the figure will result in the publication of a figure which has significance to general users.

Q. Now, I know you testified as to the area of your responsibility, and I don't know that you testified—I probably do know that you testified that wire and cable is not within your area of responsibility.

A. That is correct, sir.

Q. However, you do have certain knowledge of the Census procedures?

A. Yes, sir.

Q. Now, I show you Defendants' AR-9, which is the 1958

Census of manufacture for non-ferrous metal mill and foundry products.

A. That's correct.

Q. And I invite your attention to page 33D22, the bottom part of the page, and 32D33. These tables refer to ship-
[fol. 2278] ments of insulated wire and cable?

A. Yes, sir.

Q. Do you find any distinction in those tables between wire and cable using aluminum as a conductor on the one hand and copper as the conductor on the other hand?

A. I beg the Court's indulgence since I had nothing to do with the preparation of this, and to be fair, I am checking it through line by line to make sure I don't miss anything. I do not see any reference to aluminum or, I believe you said copper?

Q. Right.

A. That's correct.

Q. Now, however, there are breakdowns in some of these products. Take, for example, weatherproof, between braided, neoprene and thermoplastic covered, is that right?

A. Not exactly, as braided, then there is polycloroprene.

Q. Which is neoprene?

A. There is others which includes thermoplastic covered, which under Census procedure this is an example.

Q. Inviting your attention to service cable, there is a [fol. 2279] breakdown between rubber and thermoplastic insulated?

A. Yes.

Q. Now, would this indicate to you that the manufacturers in this industry were not concerned with whether or not the conductor metal was copper or aluminum?

Mr. Melchior: Your Honor, I think I am going to have to object to this line of testimony. The witness has stated he is not familiar with this particular part of the Census report and it exceeds the direct.

The Court: If he can't answer, he can say so. Overruled.

The Witness: I cannot answer that question.

By Mr. Bergson:

Q. I will ask you this question, does the fact that it is broken down say, for service cable, between rubber and

neoprene, or thermoplastic insulated, indicate that the manufacturers in that industry are interested in statistics for rubber insulated cable and thermoplastic insulated cable?

A. I cannot answer that because I do not know who was
[fol. 2279a] consulted on this, government, industry or who.

Mr. Bergson: No further questions.

The Court: All right. Redirect examination.

[fol. 2280] Mr. Melchior: I just have a few questions.

Redirect examination.

By Mr. Melchior:

Q. Mr. Bernsten, I would like to clarify one point that you were examined on in cross. I direct your attention to government Exhibit 498, which is a report.

A. The release itself.

Q. This is a report. Now, when the Bureau collected this information on government Exhibit 499, as I recall your testimony on direct, it collected it under, in four different categories, as far as conduit is concerned, under rigid conduit it collected it as steel and other?

A. That is correct.

Q. And as EMT it collected it as steel and other?

A. That is correct, sir.

Q. And then when you put out your report all you really did was to take "other rigid" and "other EMT" and added them together?

A. Yes, sir.

[fol. 2281] Q. And the only reason you did this was to prevent a disclosure of some individuals, or the possible disclosure of some individual's participation; is that right?

A. That is correct, sir.

Q. In other words, in one of those fields there were so few companies involved that it was possible to determine someone's shipments?

A. It might be possible.

Q. Might be possible, that's right. And therefore through a super abundance of caution you decided to combine them.

A. That is correct.

Q. Now, you were asked on cross-examination about pos-

sible confusion on the part of companies who are required to submit this form. Now, as a matter of fact, from time to time do members of the industry who are required to fill out these forms call the Bureau of Census for assistance in filling out this form? This is the usual occurrence, isn't it?

A. Yes.

Q. Members of the industry are aware that they can call the Bureau for assistance?

[fol. 2282] Mr. Melchior: That is all.

Recross-examination.

By Mr. Bergson:

Q. I just want to ask one question. How many companies or how few companies must there be in an industry to present a disclosure problem?

A. I am not free to answer that question.

Mr. Bergson: You are not free to answer that. No further questions.

The Court: Witness, what my trouble is here, and I am going to have to determine as a line of commerce aluminum conduit, rigid aluminum conduit, I think. Can you, do these two exhibits that we have been talking about help me to determine the amount of aluminum conduit in any particular year?

The Witness: No sir. The only thing it tells you is the total of other than steel metallic conduit, sir.

The Court: Okay. All right.

Mr. Melchior: No further questions.

(Witness excused.)

[fol. 2283] Offers in Evidence and Colloquy Thereon

Mr. Melchior: May it please the Court, the government has two or three documents it wishes to offer. I would like to have marked for identification Government Exhibit 501.

(Final judgment in the case of United States versus Standard Oil Company of New Jersey et al marked as Government Exhibit 501 for identification.)

Mr. Melchior: Government's Exhibit 501 for identification is the final judgment in the case of United States versus Standard Oil Company of New Jersey et al in the United States District Court for the Western District of Kentucky. I offer it.

Mr. Bergson: You certainly may. I have no objection.

The Court: Received.

(Government's Exhibit 501 for identification received in evidence.)

Mr. Melchior: I would like this marked.

(Directory of Aluminum Suppliers marked as Govern-
[fol. 2284] ment's Exhibit 503 for identification.)

Mr. Melchior: I offer at this time Government's Exhibit 503 for identification. This is a directory of aluminum suppliers put out by Business and Defense Services Administration, United States Department of Commerce, as revised December 15, 1959.

Mr. Bergson: No objection.

The Court: Received.

(Government's Exhibit 503 for identification received in evidence.)

(Newspaper clipping from the New York Times dated March 1, 1962 marked as Government's Exhibit 504 for identification.)

Mr. Melchior: I offer at this time Government's Exhibit 504 for identification, which is a newspaper clipping from the New York Times dated today, March 1, 1962, and the article is entitled "Two metals producers cancel their plans for joint aluminum plants." I offer that at this time.

Mr. Bergson: Your Honor, I am getting soft. I am not
[fol. 2285] going to object.

The Court: I was going to offer the one that was in my room the other day. That was the Wall Street Journal.

Mr. Melchior: The New York Times.

The Court: No, the one they sent me was from the Wall Street Journal.

Mr. Bergson: The one that said independents were the price cutters.

The Court: Yes. I will take it.

Mr. Melchior: Is that received, your Honor?

The Court: Yes.

(Government's Exhibit 504 for identification received in evidence.)

Mr. Melchior: Now I would like to reoffer at this time, your Honor, government's exhibits for identification 473 to 491, excluding government exhibit for identification 478. These documents, as your Honor will recall, are documents which were secured by discovery in another proceeding from the defendant Alcoa and they relate to four different real estate projects, to wit the Mansion House redevelopment [fol. 2286] project in St. Louis, a project in which Alcoa loaned certain monies; the Ebbett's field project in Brooklyn, in which Alcoa loaned certain monies to the Kratter Corporation, and in connection with the third project entitled "The Olympia Project" in New Jersey, we believe Monmouth, New Jersey, and finally the Century City project in which Alcoa participated with Webb and Knapp. We offer these on the ground that a reading of these documents will generally disclose the practice utilized not only by Alcoa but certain other integrated aluminum producers in attempting to insure that their own aluminum made products are utilized in these projects to the exclusion of similar products made by their non-integrated competitors. We believe that these are highly relevant in a proceeding of this type.

Mr. Bergson: I object, your Honor, for the reasons stated before plus the fact that this is not proper rebuttal.

[fol. 2287] The Court: I will sustain the objection.

Mr. Melchior: If it may please the Court, the government would like then to make an offer of proof and read it into the record.

Mr. Bergson: Your Honor, I think it is improper to make an offer of proof at this time.

The Court: These exhibits have been offered and rejected. What you are doing is getting them into the record anyway.

Mr. Melchior: I would like to read into the record what the documents would show if admitted.

The Court: You already told us what they were.

Mr. Melchior: Then that would be a sufficient offer of

proof. I wouldn't read from the documents. I did have a little more complete statement as to what we think the documents would show.

Mr. Bergson: I object to it.

[fol. 2288] The Court: All that that is is you are summarizing something and getting it into the record. The objection is sustained. I looked at them and I don't think they are relevant. I think we are going very far afield. I sustain the objection.

Mr. Bergson: Your Honor, I think I have always been taught not to argue when I have been sustained. I do think I ought to have on the record this additional fact, that after you sustained the objection before we had here testifying the executive vice president for Alcoa, Mr. Hickman, who could have been interrogated regarding these documents by the government if he so chose, and we would have a chance to answer any inferenec that he might have tried to draw from them. Consequently, I think that the plaintiff forfeited his opportunity to even make an offer of proof in this situation.

The Court: Well, I will sustain it.

Mr. Melchior: I would like to make a comment on coun-

[fol. 2289] sel's remarks if I may, your Honor. These documents relate to officers and officials other than the said Mr. Hickman, and the direct examination of Mr. Hickman sorely limited an opportunity to examine him with respect to any of the pertinent documents herein.

The Court: Did you try?

Mr. Melchior: I beg your pardon?

The Court: You didn't try to examine him on any of the documents.

Mr. Melchior: I didn't think it was appropriate.

The Court: Don't say you were limited. I think when Mr. Bergson got through somebody said "no cross."

Mr. Bergson: I think the record will show that in many instances in the trial of this case the cross went well beyond the direct on both sides.

The Court: Yes. I didn't hold you down at any time, even on incompetent evidence.

Mr. Bergson: Your Honor, I have a document that I

[fol. 2290] want to offer.

The Court: I may go out and pick up a few myself.

Mr. Bergson: Off the record.

(Discussion off the record.)

Mr. Bergson: I would like to offer as defendant's Exhibit AR-84 a statement of Clarence W. Higbee representing the import committee of the wire and cable division of the National Electrical Manufacturers Association on February 28, 1962. This document, your Honor, discusses the problems that the manufacturers of wire and cable face, or feel that they face, so far as foreign imports are concerned.

The Court: All right.

Mr. Melchior: No objection.

The Court: Received.

(Defendant's Exhibit AR-84 marked received in evidence.)

BOTH SIDES REST

The Court: Now both sides rest?

Mr. Melchior: Government rests, your Honor.

The Court: Government rests. Do the defendants rest?

[fol. 2291] Mr. Bergson: Defendants rest.

The Court: All right, motions.

Do you want to make a motion?

MOTION FOR A JUDGMENT FOR DEFENDANT'S, ETC.

Mr. Bergson: Yes. I would like to move for a judgment for the defendants on the grounds that the plaintiff has failed to prove its cause of action.

The Court: I will reserve decision. All right, I guess this finishes this lawsuit.

COLLOQUY BETWEEN COURT AND COUNSEL

Mr. Bergson: Your Honor, I think it might be appropriate at this time, if you care to take a moment or two, to discuss the scheduling that we agreed upon.

The Court: Yes. It would be a good thing to get that into the record. Have you got it?

Mr. Melchior: We have prepared a memorandum of understanding which counsel are fully in agreement on,

as I understand it, with the possible exception of the date of the hearing.

The Court: All right. Do you want to put it into the [fol. 2292] record?

Mr. Melchior: We can read it into the record.

The Court: Yes.

Mr. Melchior: (Reading) Memorandum of understanding as follows: By April 16, 1962 the plaintiff's proposed findings of fact and conclusions of law and the plaintiff's post-trial brief will be due.

On May 1, 1962 the defendants' proposed findings of fact and conclusions of law and the defendants' post-trial brief will be due.

On May 15, 1962 plaintiff's comments on defendants' proposed findings of fact and conclusions of law or plaintiff's counter proposals thereupon and plaintiff's reply post-trial brief if desired will be due.

The Court: That is agreeable to you gentlemen, that time schedule?

Mr. Bergson: Perfectly agreeable, your Honor.

The Court: All right.

[fol. 2293] Mr. Bergson: Do you think it advisable at this time, your Honor, to set a time for argument?

The Court: No. Number one, so many things happen that in my informal talk with counsel last night I said that I would like to have this submitted to me around June 1st, because I don't think I can do much with it before that time. After this May 15th, which is the last date on your memorandum of understanding, then I will as soon as I get a chance look over what you have submitted, deciding whether or not argument is necessary, and then communicate with you to fix a date for that argument. I would like to make it myself, if I am not engaged in trial somewhere, sometime between May 15th and June 1st.

Mr. Bergson: This would be entirely agreeable to us, your Honor. The one thought that we have, and of course we don't know how extensive an argument your Honor would like, but we think it might be desirable if two days would be set aside for argument.

[fol. 2294] Mr. Melchior: This would be agreeable to us.

The Court: All I am going to tell you is my own experience. You don't need this on the record.

(Discussion off the record.)

The Court: Gentlemen, it is my understanding that you gentlemen are going to file your exhibits with the clerk and are going to do it——

Mr. Bergson: Today. We are ready to do it now.

Mr. Melchior: Yes, today. Yes, sir.

The Court: All right. I think it would be very helpful if you have the manpower or stenographic power or ability to give a list of those exhibits that you file to the clerk, so he will know what he is supposed to have. I am going to leave that with you. You will be around here this afternoon.

Mr. Melchior: Sure. I will take care of it.

[fol. 2294a] The Court: I will be around. I have some other matters to take care of this afternoon.

(Whereupon, at 1:00 p.m. the case was considered closed.)

[fols. 3367-3403] IN UNITED STATES DISTRICT COURT,
NORTHERN DISTRICT OF NEW YORK

Civil No. 8030

UNITED STATES OF AMERICA, Plaintiff,

v.

ALUMINUM COMPANY OF AMERICA AND ROME CABLE CORPORATION, Defendants.

* * * * * * *

[fol. 3404] Interrogatories 6, 7, and 9

6. State the wire and cable products (by product code numbers as reported for the 1958 Census of Manufacturers) manufactured by Alcoa, Rome or others, constituting:

(a) overhead transmission and distribution lines carrying electric power from a generating plant to a house or other building constituting a consuming unit;
(b) underground transmission and distribution lines carrying electric power from a generating plant to a house or other building constituting a consuming unit;
(c) other transmission and distribution lines carrying electric power from a generating plant to a house or other building constituting a consuming unit.

7. With respect to each of the products listed in response to Interrogatory No. 6 state whether such product is used solely for:

(a) overhead (i) transmission, (ii) distribution or (iii) both;
(b) underground (i) transmission, (ii) distribution or (iii) both;
(c) other (i) transmission or (ii) distribution.

If any such product is not solely used in any one of the above categories, state its various uses and the extent of each.

9. State, which of the products, listed in response to Interrogatory No. 6, which in 1958, or in the first three months of 1959, were sold:

(a) by Alcoa;
(b) by Rome.

Answers to Interrogatories 6, 7, and 9

The following table identifies wire and cable products as requested in Interrogatory 6, being broken down between subdivisions (a) and (b) thereof. We know of no products falling within the description of subdivision (c). The use of each product, requested in Interrogatory 7, is shown [fol. 3405] under the heading "Function." It is impossible to make a firm distinction between products used solely for transmission and products used solely for distribution. For the purpose of answering Interrogatory 7, we have classified as used for distribution, products designed for voltages of 22KV and lower, and as used for transmission, products designed for voltages above 22KV. It should be noted, however, that in some instances distribution of power may be at voltages higher than 22KV, while power may be transmitted at voltages below 22KV. In the table, Interrogatory 9 is answered by showing under the heading "Sold By," whether the product was sold by Alcoa, by Rome, by both or by neither.

(a) Products Used for Overhead Transmission and Distribution Lines

Census Product	Census Code	Function	Sold By
Copper Wire and Cable			
Copper wire, bare and tinned for electrical transmission	33923-11-4	Distribution	Rome
Copper Base Alloy wire for electrical transmission	33923-51-8	Distribution	Neither
Copper strand and cable, except insulated	33923-71-0	Both	Rome
Wire rope, cable and strand (except insulated)			
Aluminum Cable—steel reinforced (ACSR) and other bare aluminum cable	34892-61-1	Both	Both
Weatherproof and Slow Burning Wire			
Braided (includes Slow Burning)	36312-31-7	Distribution	Rome
Polychloraprene (Neoprene) covered	36312-37-5	Distribution	Both
Other (includes Thermoplastic covered, etc.)	36132-39-1	Both	Bothe

[fol. 3406]

Building Wire and Cable (having Underwriters' labels) except varnished cambric insulated			
Service Cable (includes self-supporting type but excludes Service Entrance Cable)			
Thermoplastic insulated	36312-45-0	Distribution	Both
Rubber	36312-44-7	Distribution	Both
Power Wire & Cable 601 Volts and Higher			
Varnished Cambric Insulated	36312-63-6	Footnote (1)	Neither
Paper Insulated	36312-65-2	Footnote (2)	Neither
Rubber Insulated	36312-67-8	Footnote (1)	Rome
Thermoplastic	36312-68-1	Footnote (3)	Rome

[Footnotes on page 1198]

(b) Products Used for Underground Tranmission and Distribution Lines

Census Product	Census Code	Function	Sold By
Building Wire and Cable (having Underwriters' labels) except varnished cambric insulated			
Rubber insulated fibrous covered and/or Neoprene jacketed (includes lead covered)	36312-41-8	Footnote (4)	Rome
Thermoplastic (no braid)	36312-48-9	Footnote (4)	Rome
Service Entrance Cable	36312-46-3	Distribution	Rome
Power Wire & Cable 601 Volts and Higher			
Varnished Cambric Insulated	36312-63-6	Footnote (1)	Neither
Paper Insulated	36312-65-2	Footnote (2)	Neither
Rubber Insulated	36312-67-8	Footnote (1)	Rome
Thermoplastic	36312-68-1	Footnote (3)	Rome

[fols. 3407-3454]

(1) To the best of our information and belief, varnished cambric insulated power cable (36312-63-6) and rubber insulated power cable (36312-67-8) are predominately used for distribution of power within buildings, in motor leads, shipboard wiring and equipment wiring. These products are used to a lesser extent for the distribution of electric power to consuming units.

(2) To the best of our information and belief, paper insulated power cable (36312-65-2) is used primarily for the transmission and distribution of electric power from generating plants to consuming units. To a lesser extent, it is also used for the distribution of power within industrial plants.

(3) To the best of our information and belief, thermoplastic power cable (36312-68-1) is predominately used for the distribution of electric power to consuming units. To a lesser extent, it is also used for the distribution of power within buildings and in the other applications noted in footnote (1).

(4) To the best of our information and belief, rubber covered building wire (36312-41-8) and thermioplastic covered building wire (36312-48-9) are predominately used in the wiring of buildings. To a lesser extent, they are also used in conduit as services to buildings.

[fol. 3455] Interrogatory 16

16. With respect to each item of machinery and equipment in the Rome plant at the date of the acquisition, used in the manufacture, fabrication or processing the products listed below state (i) whether prior to the acquisition it was allocated, and (ii) whether it now is allocated,

(a) solely for copper;
(b) solely for aluminum; or
(c) for both aluminum and copper, and, if, for both, specify the comparative extent of the use for aluminum and the use for copper:

(1) ACSR
(2) bare wire
(3) bare cable
(4) weatherproof wire and cable
(5) service drop cable
(6) each other insulated wire or cable product.

Answer to Interrogatory 16

The attached tabulation shows whether each item of machinery and equipment in the Rome plant both before and after the date of the acquisition, used in the production of electrical wire and cable products, was allocated solely for copper, solely for aluminum, or was utilized for both aluminum and copper. To the extent possible, where an item of machinery or equipment was or is utilized for both aluminum and copper, we have specified the extent of use in making the listed electrical wire and cable products with copper or with aluminum as the electrical conductor. For the most part, it has not been possible to make the refined breakdown requested since each item of machinery or equipment is used in connection with the manufacture of many different types of electrical wire and cable products. Where existing records do not permit a breakdown according to specific products, we have used the notation "unable to isolate production types." Certain machines have been grouped together be- [fol. 3456] cause the available data does not show the extent to which any one of these functionally equivalent machines has been used for aluminum or for copper.

[fol. 3467] Interrogatory 18

18. For each of the years 1956 through 1958 and for the first quarterly period in 1959, separately state for (a) Alcoa and (b) Rome the sales of ACSR, in pounds, linear feet and dollars, broken down into sales of each type of ACSR, designated by its code word and by its cir mils or AWG.

Answer to Interrogatory 18

The attached tabulation separately states for each of the years 1956 through 1958 and for the first quarterly period in 1959 (a) Alcoa's shipments and (b) Rome's sales of ACSR in pounds, linear feet, and dollars with a breakdown according to type of ACSR. The manner in which Alcoa's records are maintained makes it impracticable to report sales by size of ACSR. Shipment data closely approximate sales data and any discrepancy would be insignificant. Because shipment rather than sales records were used, the dollar values shown for individual sizes of ACSR are based on calculation rather than actual sales revenue records.

[fol. 3468]

[fol. 3562]

INTERROGATORY 47

Identify each acquisition or merger, since January 1, 1951, of any company then or now manufacturing:

(A) any copper wire and cable product

(B) any steel conduit product

(C) any aluminum wire and cable product

(D) any aluminum conduit product

(E) any accessory product related to any product included in any of the categories (A) through (D) above by or with any company producing any such product or any material utilized in the production of any such product.

INTERROGATORY 48

With respect to each acquisition or merger identified in answer to 47, identify:

(A) the date of acquisition and the companies involved; and

(B) the products manufactured, distributed or sold by each company involved.

ANSWERS TO INTERROGATORIES 47 and 48

Acquiring Company	Products of Acquiring Company	Acquired Company	Products of Acquired Company	Date
American Enka Corp. Enka, N.C.	Rayon and nylon yarns and fibers used in covering wire and cable products	Rex Corporation West Acton, Mass.	Plastic communication and control cable	March 1958
		Wm. Brand & Co. Willemantic, Conn.	Plastic insulated control cable; fixture and appliance wire	January 1959
Anaconda Wire & Cable Co. New York, New York	Copper rod; bare and insulated or covered wire and cable	Sequoia Wire & Cable Co. Redwood City, Calif.	Special plastic wires for aircraft, missile, and electronic controls	April 1959

[fol. 3563]

Acquiring Company	Products of Acquiring Company	Acquired Company	Products of Acquired Company	Date
Beryllium Corp. Reading, Pa.	Beryllium alloys; copper rod and wire	Nonotuck Manufacturing Co. Holyoke, Mass.	Bare and stranded wire	December 1955
Cerro Corporation (Formerly Cerro de Pasco Corp.) New York, N.Y.	Copper	Circle Wire & Cable Corp. Maspeth, N.Y.	Copper rod, bare wire, building wire, cord, rubber and plastic power cable, varnished cambric, armored cable, thin wall conduit	December 1955
		Rockbestos Products Corp.	Special purpose plastic, asbestos and varnished cambric wire and cable	June 1955
Continental Copper & Steel Industries, Inc. Perth Amboy, N.J.	Insulated wire and cord sets	Spencer Wire Corp. Union, N.J.	Wire and cable	October 1955
Copperweld Steel Co. Pittsburgh, Pa.	Copper covered steel wire and rods; solid and stranded wire	Flexo Wire Co. Oswego, N.Y.	Fine bare and stranded wires	1951
Crescent Co. Pawtucket, R.I. (a division of Penn-Texas Corp. at the time of acquisitions)	Insulated wire and cable	Lowell Insulated Wire Corp. Lowell, Mass.	Flexible cords, fixture and appliance wire	October 1956
		Carol Cable Co. Pawtucket, R.I.	Flexible cords, fixture and appliance wire	October 1956

[fol. 3569] Interrogatory 50

50. Identify each type of information relating to any wire, cable, conduit, or accessory product which Alcoa, or any of its subsidiaries, reports to any agency, association, or organization, or has reported at any time since January 1, 1954. For each such type of information identify:

(A) the reporting forms
(B) the products and subjects included
(C) the agency, association or organization to whom the reports are made.

Answer to Interrogatory 50

Following is a tabulation of the types of information relating to any wire, cable, conduit, or accessory product which Alcoa or any of its subsidiaries reports or has reported since January 1, 1954, to any agency, association, or organization.

(A) Type of Information	(B) Reporting Form	(C) Products and Subjects Included	(D) To Whom Submitted
Quantity of shipments and unfilled orders	BDSAF-84	Copper wire mill products	U.S. Department of Commerce
Quantity of shipments	BDSAF-122	(1) Wire, bare, conductor and nonconductor ACSR and aluminum cable, bare Wire and cable, insulated or covered	U.S. Department of Commerce
Production Maximum production Production run out Inventory	BDSAF-481	Solid conductor and 7 strand, bare Service drop Power cable	U.S. Department of Commerce
[fol. 3570]			
Stocks on hand	BDSAF-530	All conductor Conductor, bare Weatherproof Service drop and entrance Power cable Building wire Non-metallic sheath cable	U.S. Department of Commerce

(1) During a portion of the period involved bare conductor wire was reported separately from bare nonconductor wire.

Type of Information	Reporting Form	Products and Subjects Included	To Whom Submitted
Quantity of shipments	1-Assn.	Aluminum wire other than conductor ACSR and aluminum cable, bare Aluminum wire conductor, bare Aluminum wire and cable conductor, insulated or covered	The Aluminum Association
Quantity of shipments by end use	2-Assn.	Wrought mill products	The Aluminum Association
Quantity of shipments by end use	3-Assn. & 4-Assn.	Wire, other than conductor ACSR and aluminum cable, bare Bare wire conductor Conductor wire and cable, insulated or covered	The Aluminum Association
Value and, for some items, quantity of shipments Various data relating to number of employees, payroll, material and fuel or electricity consumed, inventories, capital expenditures, etc.	MC 33 F MC 33 H MC 33 M & MC 36 A	Copper, unalloyed—rod Aluminum rod Bare wire, conductor Bare wire, non-conductor Copper wire and cable Aluminum and aluminum base alloy wire Wire rope, cable and strand (except insulated) Cable-steel reinforced (ACSR and other aluminum cable, bare) Thermoplastic, covered Polychloroprene (neoprene), covered Service cable including self-supporting type Building wire and cable Power wire and cable Marine wire and cable (U.S. Navy and Merchant Marine) Appliance wire and cord Weatherproof and slow burning wire Magnet wire Control wire and cable Signal wire and cable Communication wire and cable Extruded and drawn tube (includes conduit) Electrical conduit and conduit fittings (including underground & underfloor) Steel pipe and tube Cable installation equipment Pole line hardware Unclassified	U.S. Department of Commerce

[fol. 3571]

Type of Information	Reporting Form	Products and Subjects Included	To Whom Submitted
Value of shipments Various data relating to number of employees, payroll, material and fuel or electricity consumed, inventories, capital expenditures, etc.	MA–100	Rolled copper rods Aluminum rods Bare wire—conductor Bare and tinned copper wire and cable Aluminum wire and cable (including ACSR) Cable—steel reinforced (ACSR & other aluminum cable, bare) Weatherproof slow burning and building wire Magnet wire Communication wire and cable Appliance wire and flexible cord Power wire and cable Other insulated wire and cable Conduit—EMT and rigid Extruded and drawn tube (includes conduit) Mechanical steel tubing Raceways—electrical Cable installation equipment	U.S. Department of Commerce
[fol. 3572]			
Domestic and export shipments (footage) and total unfilled orders (tonnage)	S–530	Rigid steel conduit	National Electrical Manufacturers Assoc.
Total (domestic and export) unit sales billed	S–534	Rigid steel conduit, elbows, and couplings	National Electrical Manufacturers Assoc.

[fol. 3728] Interrogatory 61

61 (A) For each major type of each aluminum wire or cable product offered for sale at any time since January 1, 1958 by Alcoa, Rome, or Rea Magnet Wire Company

(i) identify four representative sizes which are four of the most widely sold by wire and cable manufacturers;

(ii) with respect to each type and size of each aluminum product identified in answer to subdivision (i) give the copper product and its type and size which normally would be used if the said type and size of aluminum product were not used;

(iii) for each type and size of aluminum product identified in answer to subdivision (i), and for the corresponding copper type and size identified in answer to subdivision (ii), give the list price [5] (identifying sources) as of:

(a) January 1 of each year from 1950 through 1959,
(b) July 1, 1959,
(c) October 1, 1959,
(d) January 1, 1960,
(e) April 1, 1960,
(f) July 1, 1960,
(g) October 1, 1960,
(h) January 1, 1961.

(B) Describe the method by which the copper size corresponding to any specified aluminum size is determined, and state and describe exceptions to or limitations on the general applicability of such method.

Answer to Interrogatory 61

61. (A) The following charts show the prices prevailing on the specified dates for representative sizes of conductor wire and cable products made with copper and with aluminum as the conductor metal.

[fol. 3729]

(1) Not offered in aluminum prior to December 1, 1959.

(2) Anaconda Wire & Cable price sheet, January 16, 1961.

Note: The National Electric Code governs generally the selection and installation of SE conductors. Type SE-U service entrance cable is one of the commonly used types of cables used for this purpose. We have selected four representative sizes of conductor in both aluminum and copper to provide the most commonly used ratings for services as they are shown below. Since SE cables are usually used only in short lengths, the selection of comparable copper products is in this case based upon ampacity rather than resistivity.

Rating	Copper	Aluminum
60 ampere	3c #6	3c #4
100 ampere	3c #3	3c #2
150 ampere	3c #1/0	3c #2/0
200 ampere	3c #3/0	3c #4/0

[fol. 3737] Magnet Wire

Prior to August 16, 1960, Rome did not have a list price for magnet wire made with aluminum conductor. Prices announced on that date and still in effect for representative types and sizes of aluminum magnet wire sold by Rome are as follows:

Type	Size	Price Per Pound
(1) Rectangular, double paper, single cotton wrapped	.324" x .5"	90.35¢
	.020" x .5"	167.2¢
(2) Rectangular, heavy Formvar	.204" x .675"	98.2¢
	.032" x .675"	162.75¢
(3) Rectangular, double glass or double-glass dacron	.249" x .688"	139.95¢
	.030" x .688"	219.8 ¢
(4) Rectangular, double glass or double-glass dacron with silicone treated varnish	.249" x .688"	144.90¢
	.030" x .688"	232.85¢

Prior to September 11, 1958, Alcoa did not have a list price for magnet wire made with aluminum conductor. Prices in effect as of January 1, 1959, and each other designated date, for representative types and sizes of round aluminum magnet wire sold by Alcoa are as follows:

Film Insulated-Heavy Thickness
(Prices are per 100 pounds)

Although copper magnet wire is fully substitutible for aluminum magnet wire, users do not make such substitution solely on the basis of equal current carrying capacity. A user considering the use of copper in place of aluminum magnet wire for a particular application has to consider space, load, temperature, and other operating conditions

of the equipment in which the magnet wire is to be used. He may, for example, find it advantageous to use a small copper wire with many windings rather than a larger copper wire with correspondingly fewer windings. Accordingly, it is impossible to identify the type and size of copper product that would normally be used if the aluminum products listed herein were not used.

(B) Generally, in substituting copper conductor for aluminum conductor the principal consideration is to secure equal current carrying capacity. This is generally secured by substituting a copper conductor two AWG sizes smaller than the aluminum conductor. There are situations, however, where mechanical strength, weight of the wire or cable, flex life, environmental conditions such as corrosive atmospheres, or temperature rise in the conductor with reference to the type of insulation, may require deviations from the two AWG size difference.

[fols. 3739-3740] As indicated in the answer to (A) with respect to Service Entrance Cable, where only short lengths of cable are usually involved, the choice of copper equivalent is based upon the service rating to be supplied.

[fol. 3741] Interrogatory 63

63. With respect to each of the following:

(A) EC aluminum pig
(B) EC aluminum ingot
(C) EC aluminum rod
(D) any combination of two or more of (A), (B) and (C)
(E) EC aluminum pig used in the production of
  (1) aluminum conductor wire and cable
  (2) aluminum conductor other than wire and cable
  (3) other products
(F) EC aluminum ingot used in the production of (1) aluminum conductor wire and cable, (2) aluminum conductor other than wire and cable, (3) other products
(G) EC aluminum rod used in the production of (1) aluminum conductor wire and cable, (2) aluminum

conductor other than wire and cable (3) other products

(H) any combination of two or more of (E) (F) and (G)

(i) state for each of the years 1954 through 1960, and for each quarter of 1960

(a) the total shipments, the total sales and the total production thereof, in quantity and dollar value, in the United States;

(b) the shipments thereof, the sales thereof and the production thereof, in quantity and dollar value, by each company.

(ii) give the name and address of each company producing and selling each, (a) prior to April 1, 1959, (b) as of September 1, 1960, and (c) as the latest date for which information is available.

[fol. 3742] (iii) give the location, for each company, of each plant where each is produced, and state the capacity of each such plant for the manufacture of each.

(iv) state the relative extent to which EC aluminum pig, ingot, and rod is used in each category specified in (E), (F), and (G).

Answer to Interrogatory 63

(i) (a) Defendants are without knowledge as to total shipments, sales or production in the United States of any of the products listed in (A)-(H) of this Interrogatory 63.

(i) (b) With the exception of information supplied by plaintiff in answer to defendants' Interrogatory 5(d) (ii), defendants are without knowledge as to shipments, sales or production of any of the products listed in (A)-(H) for companies other than Alcoa and Rome. Data for Alcoa and Rome for each of the designated periods are set forth in Table V.

(ii) To the best of defendants' knowledge, the following companies manufacture EC aluminum pig and ingot at the present time, and did so prior to April 1, 1959 and as of September 1, 1960.

Alcoa

Plants: Badin, North Carolina; Cressona, Pennsylvania; Lafayette, Indiana; Massena, New York; Rockdale, Texas; and Vancouver, Washington.

Aluminum Limited

Plants: Arvida, Quebec; Isle Maligne, Quebec; Kitimat, British Columbia; Shawinigan Falls, Quebec; Beauharnois, Quebec.

[fol. 3743] Anaconda Co.

Plants: Columbia Falls, Mont.

Harvey Aluminum, Inc.

Plants: The Dalles, Ore.

Kaiser Aluminum & Chemical Corp.

Plants: Ravenswood, W. Va., Spokane, Wash.

Ormet Corp.

Plants: Hannibal, Ohio.

Reynolds Metals Co.

Plants: Arkadelphia, Ark.; Listerhill, Ala.; Massena, N. Y.; Jones Mills, Ark.; Longview, Wash.; San Patricio, Tex.; Troutdale, Ore.

To the best of defendants' knowledge, each of the following companies (except Rome) manufacturers E. C. aluminum rod at the present time, and did so prior to April 1, 1959 and as of September 1, 1960:

Alcoa

Plants: Massena, N. Y.; Vancouver, Wash.

Anaconda Co.

Plant: Columbia Falls, Mont.

Essex Wire Corp.

Plant: Goshen, Ind.

General Cable Corp.

Plants: St. Louis, Mo.; Tampa, Fla.

Kaiser Aluminum & Chemical Corp.

Plant: Newark, Ohio

Olin Mathieson Chemical Corp. (Southern Electric)

Plant: Chattanooga, Tenn.

Reynolds Metals Co.

Plant: Listerhill, Ala.

[fols. 3744-3825] Rome Cable Corp.

Plant: Rome, N. Y. (acquired by Alcoa March 31, 1959; suspended the manufacture of E. C. aluminum rod, April 1960).

Southwire Co.

Plant: Carrollton, Ga.

(iii) The requested plant locations are given in the answer to (ii) of this Interrogatory 63. Defendants have no information with respect to the capacity of each such plant, for each product, for companies other than Alcoa and Rome. With respect to the plants of Alcoa and Rome, because all of the facilities used in the production of E. C. aluminum pig, ingot, and rod are also used in the production of other alloys not associated with electrical conductor, it is impossible to arrive at any meaningful capacity figures.

(iv) Defendants have no information with respect to the relative extent to which E. C. aluminum pig, ingot and rod is used in each category specified in (E), (F), and (G) of this Interrogatory 63 except as indicated in Table V.

[fol. 3826] Interrogatory 69

69. For each of the years 1950, 1952, and 1954 through 1960, and for each quarter of 1959 and 1960 state the total sales (in quantity and dollars) of overhead conductor wire and cable by (a) all companies in the United States, (b) Alcoa, (c) Rome, and (d) each other company, together with a breakdown showing:

(A) the amount thereof manufactured from (i) aluminum (ii) copper

(B) the various types of aluminum conductor and the sales of each in pounds and dollars

(C) the various types of copper conductor and the sales of each in pounds and dollars.

Answer to Interrogatory 69

There is no recognized product known as "overhead conductor wire and cable." The following conductor wire and cable products listed in defendants' answer to Interrogatory 44 can be used in overhead applications:

(1) Bare conductor wire
(2) Bare conductor cable
(3) ACSR
(4) Weatherproof wire
(5) Service drop cable
(6) Power cable under 601 volts
(7) Power cable 601 volts and higher
(8) Communication wire and cable

(1) Bare Conductor Wire:

As defendants' answer to Interrogatories 6, 7, and 9 indicates, bare aluminum conductor wire is not generally used in overhead applications; bare copper wire may be used [fol. 3827] in such applications.

(a) Defendants' knowledge as to the total sales of bare copper wire by all companies in the United States is derived solely from statistics published by the Bureau of the Census in its 1954 and 1958 Censuses of Manufactures. Since substantial quantities of bare copper wire sold for further fabrication are included in these statistics, they do not provide any basis for measuring the amount of such wire sold for overhead use. Defendants do not admit the accuracy or reliability of these statistics which are well known and readily available to plaintiff.

(b) Alcoa, prior to its acquisition of Rome, did not manufacture any copper conductor products. Alcoa has not sold any significant quantity of bare aluminum

conductor wire for use in overhead applications in any of the periods in question.

(c) To the best of defendants' knowledge, bare aluminum conductor wire sold by Rome during the periods in question was not used to any significant extent in overhead applications. Table VII sets forth Rome's total sales of bare copper wire for each of the periods in question and, to the extent that it is possible to do so, indicates the proportion of such bare copper wire that was used in overhead applications.

(d) Defendants are without knowledge as to the total sales of bare conductor wire for use in overhead applications by any company other than Alcoa and Rome for any of the periods in question.

(2) Bare Conductor Cable and (3) ACSR:

As indicated in defendants' answer to Interrogatories 6, 7, and 9, bare conductor cable, using either copper or aluminum as the conductor metal, and ACSR can be used in overhead applications.

(a) Defendants' knowledge as to the total sales by all companies in the United States of bare conductor cable [fol. 3828] and ACSR is derived solely from statistics published by BDSA and the Bureau of the Census. The Censuses of Manufactures for 1954 and 1958 purport to show total United States shipments of bare copper cable and of bare aluminum cable and ACSR. The BDSA "Facts for Industry" and "Current Industrial Reports" purport to show the United States shipments of ACSR and bare aluminum cable for each of the years 1954 through 1960, and for each quarter of 1959 and 1960. Neither the Bureau of the Census nor BDSA statistics purport to show the extent to which these products are used in overhead applications. Defendants do not admit the accuracy or reliability of any of these published statistics which are well known and readily available to plaintiff.

(b) Prior to its acquisition of Rome, Alcoa did not sell any bare copper cable. Alcoa's sales of bare aluminum cable and ACSR are shown in Table VII. It is defend-

ants' belief that most of such bare aluminum cable and ACSR was used in overhead applications.

(c) Table VII sets forth Rome's sales of bare conductor cable, both copper and aluminum, and ACSR and; to the extent that it is possible to do so, indicates the proportion of such products used in overhead applications.

(d) With the exception of information supplied by plaintiff in answer to defendants' Interrogatories 2 (e) (ii) and 5 (d) (ii), defendants have no knowledge as to the sales of bare conductor cable and ACSR by any company other than Alcoa and Rome.

(4) Weatherproof Wire:

This product, which may be made with either copper or aluminum as the conductor metal, is sold almost entirely for use in overhead applications.

[fol. 3829] (a) Defendants' knowledge of the total sales of weatherproof wire by all companies in the United States is derived solely from the 1954 and 1958 Censuses of Manufacturers which purport to show total United States shipments of this product. Defendants do not admit the accuracy or reliability of these statistics which are well known and readily available to plaintiff. Since the Census of Manufactures statistics do not differentiate between copper and aluminum, there are no published statistics which purport to show the amount of weatherproof wire manufactured from aluminum and from copper.

(b) Prior to its acquisition of Rome, Alcoa made no weatherproof wire using copper as the conductor metal. Alcoa's sales of weatherproof wire using aluminum as the conductor for each of the periods in question are given in Table VII.

(c) Rome's sales of weatherproof wire, both copper and aluminum, for each of the periods in question are given in Table VII.

(d) With the exception of information supplied by plaintiff in answer to defendants' Interrogatory 5 (d) (ii), defendants have no knowledge as to the sales of weatherproof wire by any company other than Alcoa and Rome.

(5) Service Drop Cable:

This product, which may be made with either copper or aluminum as the conductor metal, is sold almost entirely for use in overhead applications.

(a) Defendants' knowledge of the total United States sales of service drop cable is derived solely from the 1954 and 1958 Censuses of Manufactures which purport to show total United States shipments of this product. Defendants do not admit the accuracy or reliability of these published statistics which are well known and readily available to plaintiff. Since the Census of [fol. 3830] Manufactures does not differentiate between copper and aluminum, there are no published statistics purporting to show the amount of service drop cable manufactured from aluminum and from copper.

(b) Prior to its acquisition of Rome, Alcoa did not sell service drop cable using copper as the conductor metal. Alcoa's sales of service drop cable using aluminum as the conductor metal for each of the periods in question are given in Table VII.

(c) Rome's sales of service drop cable, both copper and aluminum, for each of the periods in question are given in Table VII.

(d) With the exception of information supplied by plaintiff in answer to Interrogatory 5 (d) (ii), defendants have no knowledge as to the sales of service drop cable by any company other than Alcoa and Rome.

(6) Power Cable Under 601 Volts and (7) Power Cable 601 Volts and Higher:

Certain types of insulated power cable are used in overhead applications. These may be made using either copper or aluminum as the conductor metal.

(a) Published statistics with respect to total United States shipments of power cable for each of the periods in question do not indicate the amount of power cable that is used in overhead applications, nor do such statistics indicate the amounts made from aluminum and from copper. Defendants, therefore, are without knowledge as to the total sales by all companies in the United States of power cable used overhead or as to the amounts thereof made from aluminum and from copper.

(b) Alcoa, prior to its acquisition of Rome, did not produce any power cable.

(c) Table VII sets forth Rome's sales of power cable, both copper and aluminum, for each of the periods in question and, to the extent it is possible to do so, indi- [fols. 3831-3834] cates the proportion thereof that was used in overhead applications.

(d) Defendants are without knowledge as to the total sales by any company other than Alcoa and Rome of power cable, either copper or aluminum, for use in overhead applications.

(8) Communication Wire and Cable:

Certain types of communication wire and cable are used in overhead applications. To the best of defendants' knowledge, this consists of copper telephone cable.

(a) Defendants' knowledge of the total United States sales of communication wire and cable used in overhead applications is derived solely from the 1954 and 1958 Censuses of Manufactures which purport to show total United States shipments of telephone cable. Defendants do not admit the accuracy or reliability of these pub-

lished statistics which are well known and readily available to plaintiff.

(b) and (c) Neither Alcoa nor Rome has ever manufactured communication wire and cable for use in overhead applications.

(d) Defendants have no knowledge as to the sales of communication wire and cable used in overhead applications by any other company.

[fol. 3835] Table II

On the basis of defendants' present knowledge, and subject to revision and amendment as defendants' trial preparation progresses, the attached table shows the following:

(1) the name and address of each company which has produced and sold the designated conductor wire and cable products since prior to April 1, 1959;
(2) whether the listed companies manufacture the designated products with copper, (C), aluminum, (A), or either, (CA), as the conductor metal;
(3) the location of each plant of each of the listed companies, and, insofar as defendants' have knowledge, the conductor wire and cable products made at each such plant; and
(4) whether any of the listed companies has either commenced or ceased the production and sale of any of the designated products (a) between April 1, 1959 and September 1, 1960 and (b) between September 1, 1960 and April 1, 1961.

[fol. 3850] Table III

Introduction

The following table describes the characteristics and end uses of various bare and insulated or covered wire and cable products. For the most part, these products have been made with either copper or aluminum as the conductor metal. Their end uses and construction are the same whether made with copper or with aluminum as the conductor metal. The descriptions contain references to various standards and specifications which describe properties and constructions and contain data to assist in selection and installation for end use. The following abbreviations used in the product descriptions represent the indicated organizations:

(1) ASTM—American Society for Testing Materials
(2) ASA—American Standards Association
(3) IPCEA—Insulated Power Cable Engineers Association
(4) NEMA—National Electrical Manufacturers Association
(5) MIL—Military
(6) REA—Rural Electrification Administration
(7) IMSA—International Municipal Signal Association
(8) AAR—Association of American Railroads
(9) AEIC—Association of Edison Illuminating Companies.

Unless otherwise indicated, these standards and specifications are applicable whether copper or aluminum is used.

The use of different conductor metals will result in certain differences in the physical, electrical, and chemical characteristics of the products described herein. Physically, aluminum is lighter in weight than copper, has less tensile strength and is less flexible. These physical differences will [fol. 3851] be most evident in bare conductor products but may also be reflected in the insulated or covered wire and cable products described herein. Electrically, aluminum has approximately 61% to 62% the conductivity of copper. This electrical difference will be reflected in the products de-

scribed below; and in general, a conductor product using aluminum as the conductor metal will have to be two AWG sizes larger if resistance equal to that obtained with copper is desired. (See answer to Interrogatory 61(*B*).) Chemically, copper and aluminum are different elements and have certain different chemical properties. Aluminum is more subject to corrosion than copper and has a tendency, which copper does not, to form an oxide having dielectric properties when exposed to the air. The physical, electrical, and chemical characteristics of copper and aluminum have been fully discussed in numerous technical publications which are readily available to plaintiff.

[fol. 3852] Bare Conductor Wire

Bare conductor wire consists of hard drawn, medium hard drawn or annealed solid copper or aluminum conductor in a wide variety of sizes. Bare conductor wire is used to transmit or distribute electricity and as a neutral or grounding conductor. The characteristics of bare conductor wire are described in the following standards and specifications:

(a) Hard drawn copper wire	ASTM B 1–56
(b) Medium hard drawn copper wire	ASTM B 2–52
(c) Soft or annealed copper wire	ASTM B 3–56
(d) Soft rectangular and square copper wire	ASTM B 48–58
(e) Tinned soft or annealed copper wire	ASTM B 33–58
(f) Tinned hard drawn and medium hard drawn copper wire	ASTM B 246–58
(g) Hard drawn aluminum wire	ASTM B 230–58
(h) Three-quarter hard aluminum wire	ASTM B 262–56
(i) Half-hard aluminum wire	ASTM B 323–58T
(j) Rectangular and square bare aluminum	ASTM B 324–58T

Bare Conductor Cable

Bare conductor cable consists of stranded copper or aluminum conductor supplied in a wide variety of types and sizes and tempers. It is used for the overhead transmission and distribution of electricity, for signal and telephone, and as a neutral and grounding conductor. The characteristics of bare conductor cable are described in the following standards and specifications:

[fol. 3853]

(a) Bunch stranded copper conductors	ASTM B 174–59
(b) Concentric-lay stranded copper conductors	ASTM B 8–59
(c) Rope-lay stranded copper conductors having bunch stranded members	ASTM B 172–58
(d) Rope-lay stranded copper conductors having concentric stranded members	ASTM B 173–58
(e) Concentric-lay stranded aluminum conductor	ASTM B 231–59

ACSR—Aluminum Cable Steel Reinforced

ACSR consists of a high tensile strength core of one or more wires, normally galvanized or aluminized steel, surrounded by a suitable number of hard drawn aluminum wires to give the desired electrical properties. The characteristics of ACSR are described in ASTM B 232-59T steel reinforced (ACSR) concentric-lay stranded aluminum conductors.

ACSR is used in overhead transmission and distribution of electricity, and is also covered with weather resistant materials for overhead lines.

Weatherproof Wire

Weatherproof wire is made from hard drawn, medium hard drawn, or annealed copper or hard drawn and medium hard drawn aluminum and has a weatherproof covering of either synthetic rubber, thermoplastic, or a fibrous covering (braid or knit). The characteristics of weatherproof wire are described in the following standards and specifications:

(a) Fibrous covering (braid or knit)	ASA C 8.18–1948
(b) Neoprene covering	ASA C 8.34–1954
(c) Polyethylene covering	ASA C 8.35–1947

[fol. 3854] Weatherproof wire is used on insulators in the overhead distribution of electricity and as signal wire.

Service Drop Cable

Service drop cable consists of one, two, or three insulated copper or aluminum conductors twisted around an uninsulated conductor. The uninsulated conductor acts as a neutral wire and is selected to provide sufficient mechanical strength to support the cable under the anticipated service conditions. The characteristics of the types of service drop cable

generally used are described in the following standards and specifications:

(a) Neoprene self-supporting service drop (multiplex)	IPCEA S-19-81 (3rd ed.)
(b) Polyethylene self-supporting service drop (multiplex)	IPCEA S-19-81 (2nd ed.)

Service drop cable runs overhead from the utility to the weatherhead on a building.

Service Entrance Cable

Service entrance cable consists of one or more insulated copper or aluminum conductors surrounded by a number of uninsulated strands applied with a specific length of lay, and then enclosed by a moisture resisting tape and saturated braid covering. This cable may also be supplied with an outer extruded neoprene covering replacing the tape and braid. The characteristics of service entrance cable are described in the following standards and specifications:

Types SE unarmoured, Style U	Underwriters' Laboratories Standard 854 for service cables

[fol. 3855] Service entrance cable is generally installed on the side of a house and runs from the weatherhead on the building to the meter or switchbox.

Building Wire

Building wire consists of a copper or aluminum conductor insulated with a suitable wall thickness of a vulcanized rubber compound or a thermoplastic compound (polyvinyl chloride). An outer covering of braid or thin neoprene compound or lead is used when rubber is employed as the insulator, while no outer covering is required when thermoplastic is used. More detailed constructions and characteristics of building wire are described in the following standards and specifications:

(a) Thermoplastic insulated	Underwriters' Laboratories Standard 83 or thermoplastic insulated wires
(b) Rubber insulated, braid covered	Underwriters' Laboratories Standard 44 for rubber covered wires and cables

(c) Rubber insulated, lead covered	Underwriters' Laboratories Standard 44 for rubber covered wires and cables
(d) Nonmetallic sheathed cable	Underwriters' Laboratories Standard 719 for nonmetallic sheathed and underground feeder cables
(e) Nonmetallic sheathed and underground feeder cable	Underwriters' Laboratories Standard 719 for nonmetallic sheathed and underground feeder cables

Building wire is used for general purpose wiring of branch and feeder circuits for residential, commercial, public, and industrial buildings.

[fol. 3856] Power Cable Under 601 Volts

Power cable under 601 volts consists of one or more solid or stranded, copper or aluminum conductors, with an appropriate thickness of a specified insulation. In multiple conductor designs, the conductors are twisted together with suitable fillers and binder, and an overall jacket. The characteristics of power cable under 601 volts are described in the following standards and specifications:

(a) Rubber insulated power cable	IPCEA S-19-81 (3rd Ed.)
(b) Thermoplastic insulated power cable	IPCEA S-61-402 (1st Ed.)
(c) Varnished cambric insulated power cable	IPCEA S-62-375
(d) Paper insulated lead covered power cable	AEIC
(e) Interlocked armored cable (rubber or thermoplastic insulated)	IPCEA S-19-81 (3rd Ed.)
(f) Lead sheathed cable (rubber or thermoplastic insulated)	IPCEA S-19-81 (3rd Ed.)
(g) Self-supporting aerial cable (rubber or thermoplastic insulated)	IPCEA S-19-81 (3rd Ed.)

Power cable under 601 volts is used for low voltage power feeders to and within structures and for low voltage power distribution systems, aerially, in conduit, in underground ducts, directly buried in earth, and on trays.

Power Cable 601 Volts and Higher

Power cable 601 volts and higher consists of one or more solid or stranded, copper or aluminum conductors, with an appropriate thickness of a specified insulation. A different

thickness of insulation is used for power cable 601 volts [fol. 3857] and higher than for power cable under 601 volts. In multiple conductor designs, as with power cable under 601 volts, the conductors are twisted together with suitable fillers and binder, and an overall jacket. The characteristics of power cable 601 volts and higher are described in the following standards and specifications:

(a) Rubber insulated power cable	IPCEA S-19-81 (3rd Ed.)
(b) Thermoplastic insulated power cable	IPCEA S-61-402 (1st Ed.)
(c) Varnished cambric insulated power cable	IPCEA S-62-375
(d) Paper insulated lead covered power cable	AEIC
(e) Interlocked armored cable (rubber or thermoplastic insulated)	IPCEA S-19-81 (3rd Ed.)
(f) Lead sheathed cable (rubber or thermoplastic insulated)	IPCEA S-19-81 (3rd Ed.)
(g) Self-supporting aerial cable (rubber or thermoplastic insulated)	IPCEA S-19-81 (3rd Ed.)

Power cable 601 volts and higher is used for high voltage power feeders to and within structures and for high voltage power distribution systems, aerially, in conduit, in underground ducts, directly buried in earth, submarine and on trays.

Magnet Wire

Magnet wire consists of round, square or rectangular copper or aluminum wire. Four general classes of insulation are usually employed as coverings for magnet wire: film coatings, including oleo-resinous varnishes, enamels, vinyl acetal, epoxy, and nylon; paper coverings; cotton [fol. 3858] coverings; and glass coverings, including fiberglass and combinations of glass and dacron. The characteristics of magnet wire are described in the following standards and specifications:

(a) Cotton covered, square and rectangular	NEMA MW 12 (Proposed)
(b) Cotton covered, round	NEMA MW 11-1953
(c) Paper covered, square and rectangular	NEMA MW 33-1957
(d) Paper covered, round	NEMA MW 31-1956
(e) Double paper, single cotton covered, square and rectangular	NEMA MW 32-1955

(f) Glass covered, square and rectangular	NEMA MW 42-1957
(g) Glass covered, silicone treated, square and rectangular	NEMA MW 43-1959
(h) Glass covered, silicone treated, round	NEMA MW 44 (Proposed)
(i) Glass covered, round	NEMA MW 41-1959
(j) Dacron-glass, square and rectangular	NEMA MW 46-1958
(k) Dacron-glass, round	NEMA MW 45-1959
(l) Heavy formvar, square and rectangular	NEMA MW 18-1955
(m) Heavy epoxy, square and rectangular	NEMA MW 14 (Proposed)

Magnet wire is used as an electrical winding material in coils for motors, generators, capacitors, transformers, solenoids, etc.

Communication Wire and Cable

Communication wire and cable consists of insulated copper or aluminum conductors. In multiple conductor con- [fol. 3859] structions, the desired number of conductors are twisted together with an overall binder and a jacket applied. The characteristics of communication wire and cable are described in the following standards and specifications:

(a) Polyethylene and PVC insulated multi-conductor instrumentation and interconnecting cables	ASTM D 1351-54T ASTM D 734-50T MIL-W-16878 MIL-W-76
(b) Polyethylene insulated single and multi-paired telephone cable	REA P-E-14
(c) Polyethylene and PVC insulated hook-up wire	U/L Appliance Wiring Materials Standards
(d) Paper telephone cable	Western Electric Type 268-85

Communication wire and cable is used in a variety of applications, including the following:

For instrumentation circuits, telemetering, circuit control testing, electronic computers, business machines, missiles and other similar applications; for interconnecting between electronic apparatus; for telegraph and telephone use generally including exchange areas, and plants, telephone switchboards, etc.; and for hook-up wire for radio, TV, and other electronic apparatus.

Control Wire and Cable

Control wire and cable consists of two or more solid or stranded, small, insulated copper or aluminum conductors. In multiple conductor designs, the desired number of conductors are twisted together with suitable fillers and binder, and an outer covering or jacket applied. The characteristics of control wire and cable are described in the following standards and specifications:

[fol. 3860]

(a) PVC machine tool and control wire	National Machine Tool Builders Association
(b) Polyethylene insulated multi-conductor control cable	Interim standard # 2 to IPCEA S-61-402
(c) PVC insulated multi-conductor control cable	IPCEA S-19-81 (2nd Ed.)
(d) Rubber insulated multi-conductor control cable	IPCEA S-19-81 (3rd Ed.)

Control wire and cable is used for operation and interconnection of protective devices, and for monitoring, data recording and conveyance of information, the latter including telemetering, pressure flow, indicating lights, etc. Control wire and cable is also used for wiring industrial equipment such as machine tools.

Signal Wire and Cable

Signal wire and cable consists of a rubber or thermoplastic insulated single or multiple copper or aluminum conductor cable intended for use overhead or underground in signal systems such as railway, traffic, fire alarm, or police alarm systems. The characteristics of signal wire and cable are described in the following standards and specifications:

(a) Rubber insulated fire alarm and traffic signal cables	IMSA # 5
(b) Polyethylene insulated fire alarm and traffic signal cables	IMSA # 19-1
(c) PVC insulated fire alarm and traffic signal cables	IMSA # 20
(d) Rubber insulated railroad signal wire	AAR # 111
(e) Rubber insulated railroad signal cable	AAR # 161, 240

[fol. 3861] Appliance Wire and Flexible Cord

Appliance wire consists of single or multiple concentric or bunched stranded copper or aluminum conductor wires designed for internal or accessory wirings of electrical appliances and equipment. It is insulated with rubber, thermoplastic compounds or fibrous materials of the type to which Underwriters' Laboratories appliance wiring materials labels may be applied. Typical characteristics of appliance wire are described in the following standards and specifications:

(a) PVC insulated appliance wire	U/L Appliance Wire Standard, ASTM D734–50T
(b) Types RF and RFH rubber insulated fixture wire	Underwriters' Laboratories standard 62 for flexible cord and fixture wire
(c) Types TF and TFF thermoplastic insulated fixture wire	Underwriters' Laboratories standard 62 for flexible cord and fixture wire

Flexible cords cover a broad range of construction in which the conductor consists of fine sizes of wire which are generally bunch stranded in order to give the desired degree of flexibility. In some cords, the conductors are laid parallel which gives an oval construction. Other types are made with two, three, or four conductors twisted with an outer jacket forming a finished round cord. These products employ two principle types of insulation and jackets—rubber insulation with rubber jackets, and thermoplastic insulation and jacket. Typical characteristics of flexible cords are described in the following standards and specifications:

(a) Type SV rubber insulated vacuum-cleaner cord	Underwriters' Laboratories standard 62 for flexible cord and fixture wire
(b) Type SJO rubber insulated junior hard-service cord	Underwriters' Laboratories standard 62 for flexible cord and fixture wire
(c) Type SO rubber insulated hard-service cord	Underwriters' Laboratories standard 62 for flexible cord and fixture wire

[fols. 3862-3863] Automotive and Aircraft Wire and Cable

Automotive and aircraft type wire and cable is used for ignition, starter, battery, or primary wiring systems in automotive vehicles and aircraft.

Marine Wire and Cable

Marine wire and cable includes copper wire and cable for use in the Merchant Marine service or for use on Navy vessels. It can consist of a wide variety of single or multiple conductors made in accordance either with MIL-C-915A for Navy use, or the recommended practice of American Institute of Electrical Engineers for electrical insulation on Merchant Marine vessels.

Portable Cord and Cable

Portable cord and cable consists of one or more insulated, stranded copper or aluminum conductors covered with an outer jacket of thermoplastic compound, neoprene, or synthetic rubber, or rubber, molded or unmolded. Portable cord generally has a conductor size 10 or smaller while portable cable is size 8 or larger. Portable cord and cable are used to supply electric power to mining machines, mining locomotives, portable power shovels, dredges, welding sets, concrete mixers, and electrical appliances.

[fol. 3864] Table V

Introduction

This table sets forth Alcoa's total production and total sales of (A) EC aluminum pig, (B) EC aluminum ingot, and (C) EC aluminum rod and Rome's total production and total sales of (C) EC aluminum rod. Rome did not produce or sell any EC aluminum pig or ingot.

In addition, this table sets forth Rome's sales of EC aluminum rod to be used in the production of (1) aluminum conductor wire and cable and (3) other products. No rod produced by Rome was sold for use in the production of (2) aluminum conductor other than wire and cable. With respect to Alcoa the table shows sales of EC aluminum pig, ingot, and rod to be used in the production of (1) aluminum conductor wire and cable, (2) aluminum conductor other than wire and cable, and (3) other products. All figures shown are subject to errors inherent in attempting to ascertain the end use to which a product was put by defendants' customers.

It is impossible to show the production by either Alcoa or Rome of EC pig, ingot, or rod used in each category specified in (E), (F), and (G) since such products are not earmarked for any particular use at the time of production. EC pig, ingot, or rod produced during any period can be (a) sold as such product in a current or subsequent period, (b) placed in inventory, or (c) further fabricated during the current period. The sales figures set forth in this table provide some indication of the extent to which total production over a period of years is sold for the designated end uses. All of Rome's EC rod that is not sold is utilized by Rome in the fabrication of conductor wire and cable products. EC pig that is not sold by Alcoa is utilized to make EC ingot. As indicated by defendants' answer to [fol. 3865] Interrogatory 65 (d), EC ingot which is not sold as such would be utilized in producing EC redraw rod or busbar. As also indicated in defendants' answer to Interrogatory 65 (d), EC rod which is not sold as such would be used in the production of conductor or non-conductor wire and cable products.

EC ALUMINUM PIG

(A) Alcoa

	Total Production		Total Sales		Sales for Use in Production of Aluminum Conductor Wire or Cable		Sales for Use in Production of Aluminum Conductor Other Than Wire or Cable		Sales for Use in Production of Other Products

3rd Qtr.	21,840,044	.287	(1,208)	(354)			(1,208)	(354)		
4th Qtr.	21,426,301	.278	63,604	17,681			63,604	17,681		

(B) Rome

Rome neither produced nor sold EC aluminum ingot.

---

(1) The value shown is the average sales revenue for EC ingot sold by Alcoa and approximates the value of this product. However, the value is not precisely accurate since the proportion of each size and shape of EC ingot comprising EC ingot sales is not exactly the same as the proportion of each size and shape of EC ingot comprising EC ingot production. This results from Alcoa's use of a substantial amount of this production for further fabrication in its own plants.

(1) Value shown is derived for 1954 by multiplying production by annual average market price, because Rome sold no rods for these years, and for other years by multiplying production by annual average sales price. Rome suspended production of rod April 1, 1960.

[fol. 4437] IN THE UNITED STATES DISTRICT COURT, NORTHERN DISTRICT OF NEW YORK

Civil No. 8030

UNITED STATES OF AMERICA, Plaintiff,

against

ALUMINUM COMPANY OF AMERICA AND ROME CABLE CORPORATION, Defendants.

The Findings of Fact and Conclusions of Law, set out below, together with the opinion, filed herewith, will constitute the decision in this case.

FINDINGS OF FACT—Filed January 28, 1963

1. The defendants, Aluminum Company of America and Rome Cable Corporation, hereinafter referred to as Alcoa and Rome, maintain offices, transact business and are found within the Northern District of New York.

2. The defendant Alcoa is a corporation organized and existing under the laws of the State of Pennsylvania, with its principal office in Pittsburgh, Pennsylvania.

3. Alcoa is an integrated aluminum producer engaged in the manufacture and sale of primary aluminum, intermediate aluminum products, and various end products. It manufactures these products in several states and sells and ships such products throughout the United States in interstate commerce.

4. The defendant Rome is a wholly owned subsidiary of Alcoa, organized and existing under the laws of the State of Delaware, with its principal office at Rome, New York. It was organized by Alcoa for the purpose of holding the assets of its predecessor, also called Rome Cable Corporation, a New York corporation.

5. Rome manufactures, among other products, copper rod, electrical wire and cable, conduit and cable trough and cable installation devices. It manufactures these products in several states and sells and ships them in interstate commerce to its customers located in many states of the United States.

6. On March 31, 1959, defendant Alcoa acquired by stock [fol. 4438] transfer all of the assets of Rome-New York. Title to such assets was taken by the defendant Rome (Delaware) which also assumed Rome-New York's liabilities.

7. Alcoa's purpose in acquiring Rome was to acquire the ability to manufacture the more complicated insulated wire and cable products and diversify its operations. Rome's manufacture of aluminum products did not induce said acquisition.

8. In its search for a suitable company, Alcoa in 1958 retained the services of Ebasco Services, Inc. Ebasco was advised that Alcoa's purpose was to secure know-how in the insulating field.

9. While Alcoa considered other insulating companies, Rome was its first choice. This preference arose principally from the fact that Rome's personnel and organization were well and favorably known to Alcoa through their mutual association in a "tolling arrangement" entered into in 1952.

10. In the course of negotiations with Rome, Alcoa made it clear that, if acquired, Rome would operate as a separate division with a high degree of autonomy and increased responsibility with regard to the sale of wire, cable and conduit products.

11. The evidence does not establish that Alcoa's acquisition of Rome was part of a continuing program contemplating future expansion through mergers or acquisitions in wire and cable, conduit, or any related field.

12. Alcoa mines and processes bauxite, refines bauxite into alumina, and smelts alumina into aluminum. The aluminum, so produced, is sold either in alloyed or unalloyed form, as ingot, or is used by Alcoa in its own fabrication of a wide variety of semi-finished and finished products. Among the products fabricated by Alcoa are sheet and plate, extrusions, castings, forgings, wire, rod and bar, electrical conductors and accessories, conduit, foil, tubing, rivets and screw machine products, closures, and powder and paste.

13. Prior to the acquisition of Rome, Alcoa's participation in the electrical wire and cable field was limited to the manufacture and sale of bare all-aluminum cable, bare

[fol. 4439] aluminum conductor steel reinforced (ACSR), and polyethylene covered line wire and multiplex cable. It also sold neoprene covered line wire and multiplex cable manufactured for it by Rome. Alcoa made no electrical wire and cable products using copper as the conductor; nor did it make any of the more complicated insulated constructions, such as, among others, building wire, power cable, control cable, and magnet wire.

14. Bare wire and cable products constituted the great preponderance of Alcoa's sales in the electrical wire and cable field. In 1958, out of Alcoa's total conductor wire and cable shipments of 62.9 million pounds, ACSR and bare aluminum cable amounted to 56.9 million pounds, or more than 90 percent of the total.

15. While Alcoa continues to be the leading United States producer of primary aluminum and fabricated aluminum products, its position has declined markedly in recent years. (Opinion page 11).

16. Prior to the acquisition, Rome was primarily a manufacturer of electrical wire and cable. It had three manufacturing plants located at Rome, New York; Torrance, California; and Collegeville, Pennsylvania. It produced and sold bare wire and cable and a diversified line of insulated wire and cable products; it manufactured copper and aluminum rod for use in its own operations and for sale to other manufacturers; and it produced copper rod and certain wire and cable products on a toll basis using materials supplied by others. In addition, at its plant in Torrance, California, Rome manufactured steel rigid conduit and electrical metallic tubing (commonly referred to as EMT) and mechanical steel tubing. At its Cope Division plant in Collegeville, Pennsylvania, it manufactured a line of cable supporting systems, including cable trough and trays. In calendar year 1958, Rome's sales (exclusive of toll conversion) in its major product categories were approximately as follows: Wire and cable, $23.4 million; rod, 4 million (includes aluminum rod sales of $128 thousand); [fol. 4440] conduit (rigid and EMT) $6.5 million; and, Cope products, $1.3 million.

17. Rome's primary emphasis in the wire and cable field was on the manufacture of insulated wire and cable products. It was a skilled manufacturer of the more compli-

cated insulated products, and had in this area technical ability that Alcoa lacked.

18. Copper was by far the predominant metal used by Rome in its wire and cable operations. Its importance is shown by the fact that in the five years prior to the acquisition copper represented more than 90 percent of Rome's combined copper and aluminum purchases, and copper products accounted for more than 90 percent of its wire and cable sales revenue.

19. On March 7, 1952, Alcoa and Rome entered into a continuing agreement, referred to as a "tolling agreement", whereby Rome would cover bare aluminum wire furnished by Alcoa for the account of Alcoa. The agreement provided that Rome would cover or insulate bare aluminum wire with neoprene or polyethelene insulating materials. The arrangement permitted Alcoa to take advantage of the superior "know-how" of Rome in the matter of covering of bare wire products some of which were sold in competition with Rome.

20. Prior to the acquisition only five products were manufactured and sold by both Alcoa and Rome. These products can be identified as follows: (a) Aluminum Conductor Steel Reinforced (ACSR) and Aluminum Cable, Bare; (b) Covered Line Wire (also referred to as Weather-proof). This product consists of a copper or aluminum conductor covered with a synthetic rubber (neoprene), thermo-plastic (Polyethylene), or fibrous covering; (c) Multiplex Cable; (d) Conduit; (e) Aluminum Redraw Rod. Aluminum redraw rod is an intermediate aluminum product used in the fabrication of aluminum wire.

21. Prior to the acquisition, defendants manufactured and sold the overlap products referred to in Finding 20 as follows:

[fol. 4441] (a) ACSR and Aluminum Cable, Bare. Alcoa made ACSR and aluminum cable, bare, in a full range of sizes; Rome made only a limited range of sizes. Alcoa's total sales amounted to approximately $23,000,000 in 1958, of which approximately $8,000,000 represented sales in the size range Rome was able to make. Rome's sales in 1958 amounted to approximately $240,000.

(b) Covered Line Wire and Multiplex Cable. Alcoa did not sell these products until 1952 when it entered into a tolling arrangement with Rome under which Rome manufactured polyethylene and neoprene covered aluminum line wire and multiplex cable which Alcoa sold for its own account. In 1956, Alcoa started to produce its own polyethylene covered line wire and multiplex cable, and at the time of the acquisition it had under consideration a plan to install neoprene covering facilities. Rome produced covered line wire using copper or aluminum conductors and having either neoprene, polyethylene or fibrous covering. It also produced multiplex cable using copper and aluminum insulated conductors. Alcoa's covered line wire and multiplex sales in 1958 amounted to approximately $4,200,000; Rome's sales in that year, including both copper and aluminum, were approximately $3,700,000.

(c) Conduit. Prior to the acquisition, Rome manufactured steel conduit, both rigid and EMT; it made no aluminum conduit. Alcoa manufactured rigid aluminum conduit and aluminum EMT; it made no steel conduit. Alcoa's sales of aluminum conduit in 1958 amounted to approximately $525,000; Rome's sales of steel conduit amounted to about $6,500,000.

(d) Aluminum Redraw Rod. Prior to the acquisition Alcoa produced aluminum redraw rod on its rolling mills and Rome produced such rod by the Properzi method. Alcoa made sales of aluminum rod to other manufacturers of approximately $2,500,000 in 1958. Most of Rome's aluminum rod was consumed in its own operations, its sales to other manufacturers in 1958 amounting to only about $128,000.

22. Alcoa's net sales and operating revenues in 1958 amounted to approximately $753,000,000. Its sales in the overlap area, consisting of ACSR and aluminum cable, bare (sizes 336,400 cir. mils. and smaller), covered line wire and multiplex cable, conduit and aluminum rod, totalled approximately $15,300,000, or about 2 percent of its net sales and operating revenues. The ratio between Alcoa's

overlap and total sales for earlier years is approximately the same.

[fol. 4442] Lines of Commerce

Explanation

Items 1-10, set forth on pages 13 and 14 of the filed opinion, detail the lines of commerce urged by the plaintiff as properly established in this action. Reference to same is made here without the repetition thereof. The Findings below are intended to supplement those made in the discussion of the various items as same appears in pages 14 to 19 of said opinion.

Aluminum Conductor Lines

23. Item 1, aluminum conductor wire and cable, is a composite of Items 2 and 3 and is not a separate and distinct line of commerce here. (See Opinion, page 15).

24. Item 2, bare aluminum cable and ACSR (aluminum covered steel reinforced) have virtually displaced bare copper cable for use in overhead transmission lines. They are generally recognized as a separate product classification and the manufacture and sale of these products require special stranding equipment and designing skill. The parties have agreed that the manufacture and sale of bare aluminum cable and ACSR may be treated as a separate line of commerce for the purpose of this case and it is so found.

25. Item 3, insulated or covered aluminum wire and cable. The wire and cable industry defines insulated wire and cable products according to function or type, not according to the metal used as conductor.

26. Manufacturers of insulated wire and cable products regard themselves as insulators of wire and cable products, not as insulators of copper wire and cable on the one hand, or of aluminum wire and cable on the other.

27. The evidence establishes that wire and cable fabricators can draw, strand and insulate copper and aluminum interchangeably on the same equipment and with the same personnel. The only change required is the use of a different lubricant in the drawing operation and a cleanup of [fol. 4443] the drawing machine when it is to be used on a different metal.

28. Since copper and aluminum products are completely interchangeable from a performance standpoint, utility companies choose between copper and aluminum insulated or covered overhead products solely on the basis of economics. The decision requires evaluation of numerous economic factors in addition to the cost of the wire or cable itself.

29. While aluminum is used in various insulated wire and cable products, most such products, accounting for more than $1,250,000,000 out of total 1958 insulated wire and cable shipments of $1,320,000,000, are predominantly made from copper. Aluminum has gained its greatest acceptance in the insulated or covered field in products used in the overhead distribution of electric power, principally, covered line wire (weatherproof) and multiplex cable. Even with respect to these products, however, substantial quantities are sold using copper as the conductor.

30. Item 4. Aluminum ingot and rod used in the production of aluminum conductor wire and cable is a separate line of commerce. (See Opinion page 16).

Conductor Wire and Cable Lines

31. Item 5, Conductor wire and cable (aluminum and copper) as a line of commerce corresponds to the electrical wire and cable industry. It includes the manufacture and sale of all bare and insulated or covered electrical wire and cable products, whether made from copper or aluminum. There is a generally recognized electrical wire and cable industry and the parties agree that conductor wire and cable may be treated as a line of commerce for the purpose of this case.

32. Item 6, Conductor wire and cable, bare, (aluminum and copper) which consists of ACSR and aluminum cable, bare; bare conductor aluminum wire; and bare conductor copper wire and cable, is not a separate line of commerce here. (Opinion page 17).

[fol. 4444] 33. Item 7, Wire and cable, insulated or covered (aluminum and copper) line of commerce consists of the manufacture and sale of all insulated or covered wire and cable products, both copper and aluminum and it is

agreed that same constitutes a separate line of commerce here.

34. By item 8, Service drop cable (aluminum and copper), plaintiff refers exclusively to multiplex cable, both copper and aluminum. The evidence fails to establish that the manufacture and sale of multiplex cable is a line of commerce separate and distinct from the manufacture and sale of other insulated or covered wire and cable products.

35. Multiplex cable is only one of many products of the insulated wire and cable industry. It is one of the simplest of such products, being nothing more than one or more simple insulated conductors twisted together with a bare cable. It requires no unique production facilities.

36. Virtually any manufacturer of insulated wire and cable products is capable of making multiplex cable. A company equipped to manufacture building wire, power cable, control cable, or practically any other insulated wire and cable product can use its existing machinery and personnel to manufacture multiplex cable. Such companies constantly review their product lines, and switch from one product to another whenever it is profitable to do so.

37. Multiplex cable is not used exclusively as a service drop from the utility pole to the building, nor is it the only product used for that function.

(a) Weatherproof line wire in the form of two or three separate wires is extensively used for service drop purposes.

(b) Other cable, including Type K and Type SD cable, are used for service drop purposes.

(c) In addition to being used for service drop purposes, multiplex cable is also used as a self-supporting secondary line. The IPCEA-NEMA Standards Publications covering multiplex cable define the product as "neutral-supported secondary and service drop cables."

[fol. 4445] 38. Item 9, Conduit (aluminum and steel). The parties are agreed that the manufacture and sale of conduit, both aluminum and steel, may be treated as a line of commerce for the purpose of this case.

39. The evidence does not establish that the manufac-

ture and sale of aluminum conduit is a separate line of commerce.

40. Steel conduit and aluminum conduit are functionally interchangeable. Both are used to enclose and protect electrical wires and cables against external mechanical and chemical abuse. The evidence establishes that steel and aluminum conduit are in direct and substantial competition with each other.

41. The pricing of steel and aluminum conduit is directly related. Changes in the price of steel conduit cause corresponding changes in the price of aluminum conduit, and vice versa.

42. Aluminum conduit manufacturers meet strong and vigorous competition from the manufacturers of steel conduit, and vice versa.

The Geographic Market

43. The parties agree that the United States as a whole is a proper geographic market or "section of the country" within which the impact of the acquisition may be measured as to all of the lines of commerce, whether or not allowed herein.

44. It has not been established that the eleven western states (Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming) constitute an appropriate geographic market or "section of the country" with respect to either the conduit or the alleged aluminum conduit lines of commerce.

Competitive Effect in the Claimed Lines of Commerce

45(a) Statistics showing Alcoa and Rome market shares in the aluminum conductor lines of commerce, both before and since the acquisition, are set forth in the following tables.

[fol. 4446]

ACSR and Aluminum Cable, Bare

Year	Alcoa %	Rome %
1954	48.4	0.2
1955	43.2	0.1
1956	29.8	0.3
1957	32.3	0.3
1958	32.5	0.3
1959	31.4	0.7
1960	30.6	0.1
1961	26.1	

Aluminum Wire and Cable, Insulated or Covered

Year	Alcoa %	Rome %
1954	10.0	6.9
1955	10.8	6.9
1956	8.5	6.2
1957	9.4	5.3
1958	11.6	4.7
1959	12.2	4.4
1960	10.6	4.2
1961	7.3	5.7

Aluminum Conductor Wire and Cable

Year	Alcoa %	Rome %
1954	42.8	1.1
1955	36.6	1.5
1956	24.8	1.7
1957	27.4	1.4
1958	27.8	1.3
1959	26.9	1.5
1960	25.4	1.2
1961	23.5	1.3

45(b). The relative market position of Alcoa and Rome combined in each of the three alleged aluminum conductor lines of commerce declined substantially both before and since the acquisition.

[fol. 4447] Alcoa-Rome Market Percentages

				Decline Percentage Points		
	1954	1958	1961	1954–58	1958–61	1954–61
ACSR and Aluminum Cable, Bare	48.6	32.8	26.1	15.8	6.7	22.5
Aluminum Wire and Cable, Insulated or Covered	16.9	16.3	13.	.6	3.3	3.9
Aluminum Conductor Wire and Cable	43.9	29.1	24.8	14.8	4.3	19.1

46. There is no significant pattern or trend of mergers with respect to the manufacture and sale of aluminum conductor wire and cable products.

47. In addition to Alcoa's acquisition of Rome, the only acquisitions which relate in any way to aluminum conductor wire and cable products were Olin-Mathieson Chemical Corporation's acquisition of Southern Electrical Corporation in early 1957, Kaiser Aluminum and Chemical Corporation's acquisition of the Bristol plant of United States Rubber Corporation in early 1957, the Reynolds Metals Company's acquisition of the machinery of John A. Roebling's Sons Division of the Colorado Fuel and Iron Corporation in 1961.

48. Market statistics reflecting the market shares of the acquiring and acquired companies, both before and since the acquisitions are set forth in the following table:

Percentage Participation in Aluminum Conductor Wire and Cable

	1955	1956	1957	1958	1959
Southern Electrical	5.4	8.1			
Olin-Mathieson	0.0	0.0			
Combined Post-Acquisition			5.6	4.5	5.0
Kaiser	21.9	19.5			
U.S. Rubber	0.8	0.8			
Combined Post-Acquisition			18.8	23.1	19.0
Reynolds	8.0	8.1	9.0	10.4	10.8
Roebling	0.0	0.0	0.0	0.0	0.1

49. The evidence fails to establish that Olin's acquisition of Southern and Kaiser's acquisition of the Bristol Plant of U. S. Rubber has hurt or will adversely affect competing manufacturers of aluminum wire and cable products.

[fol. 4448] 50. No competing manufacturer of aluminum conductor wire and cable products has complained that this acquisition has or may adversely affect his competitive position. On the contrary, representatives of Central Cable, Southwire, General Cable, Essex, Nehring and other wire and cable manufacturers stated that in the three years since the acquisition there had been no adverse effect. No manufacturer-witness testified that he foresaw any future adverse effect, as a result of this acquisition.

51. The evidence fails to establish that Alcoa's ability to offer a broad line of insulated products, including those made from copper, gives it any substantial competitive advantage in the sale of aluminum wire and cable products.

52. The evidence establishes that prior to the acquisition, there was not substantial or vigorous competition between Alcoa and Rome in the sale of aluminum conductor wire and cable products. Alcoa's loss of business in such products from 1957 to 1959 was insignificant.

53. In regard particularly to the overlap wire and cable products, Rome was not an aggressive price competitor. It adhered to a policy of not going below the prices of its competitors. It rarely participated in competitive bidding for ACSR; on insulated or covered products, it would generally quote on the basis of its published price schedules. Rome's adherence to this policy is established by the testimony of utility purchasing agents who stated, without contradiction, that Rome was not an initiator of price reductions.

54. As recently as 1951, there were only four manufacturers of insulated wire and cable using aluminum conductor. The evidence establishes that as of April 1, 1961, there were at least 29 producers of insulated aluminum wire and cable.

55. Companies equipped to manufacture more complicated insulated copper wire and the cable products, such as building wire, power cable and control cable, can readily manufacture the more simple products such as line wire and multiplex cable, using either copper or aluminum con-
[fol. 4449] ductors, with its existing machinery and personnel.

56. The numerous manufacturers of insulated wire and cable constantly review their product lines and switch

readily from one product or conductor metal to another in accordance with market conditions. Such manufacturers not presently making insulated or covered aluminum products have considered whether or not to make such products, and would make them if profitable orders were obtained.

57. There has been substantial entry into the manufacture of ACSR and bare aluminum cable. Prior to 1940, Alcoa was virtually the only producer of these products; by 1950 there were 12 producers, most of whom were experienced copper wire and cable producers before getting into the ACSR field.

58. The evidence fails to establish or to permit the inference that any person has ceased or has been or probably will be deterred from entering into the manufacture and sale of aluminum conductor wire and cable products because of this acquisition.

59. Purchasers of the overlapping aluminum conductor products—ACSR and aluminum cable, bare, aluminum line wire, and aluminum multiplex cable—have not been and will not be adversely affected by the Rome acquisition.

60. Some of the utilities which formerly purchased from both Alcoa and Rome have sought to broaden the competitive base of their wire and cable purchasing. No difficulty has been encountered in expanding the supplier group.

61. Prior to the acquisition, Rome was a follower rather than an initiater of price reductions or concessions. It was rarely awarded business on the basis of competitive bidding.

62. The evidence establishes that there is vigorous competition among all manufacturers of aluminum conductor wire and cable products. The evidence fails to establish that any competitor of Alcoa and Rome, either integrated or non-integrated, has been or will be adversely affected by this acquisition.

[fol. 4450] 63. Non-integrated manufacturers of aluminum conductor wire and cable products will not be deprived of a source of aluminum as a result of Alcoa's acquisition of Rome.

64. Substantial quantities of aluminum are available from foreign sources. Canadian production alone in 1960 amounted to more than 1.5 billion pounds, or more than 35 percent of total U. S. primary aluminum production. Such foreign aluminum is suitable for use by wire and cable

fabricators and such fabricators have, in fact, purchased substantial amounts of foreign aluminum.

65. Alcoa's ability to supply non-integrated fabricators, including manufacturers of aluminum wire and cable, will not be affected by the acquisition of Rome. It has operated below capacity since 1957.

The following table shows Rome's pre-acquisition purchases of aluminum.

(Thousands of Pounds)

Year	Total U.S. Primary Aluminum Production	Alcoa Primary Aluminum Production	Rome Primary Aluminum Purchases	Rome Primary Aluminum Purchases: % of Total U.S. Primary Aluminum Production	Rome Primary Aluminum Purchases: % of Alcoa Primary Aluminum Production
1954	2,921,130#	1,331,874#	1,611#	.1%	.1%
1955	3,131,442	1,404,461	3,175	.1	.2
1956	3,357,908	1,512,278	5,258.	.2	.3
1957	3,295,418	1,424,095	3,236	.1	.2
1958	3,131,114	1,041,724	3,133	.1	.3

Under provisions of supply contracts with the General Services Administration, Alcoa is obligated to make available to non-integrated fabricators approximately 150,000,000 pounds of aluminum each year through 1971. Similar obligations on the part of Kaiser, Reynolds, and Harvey, make available to non-integrated users approximately 300,000,000 additional pounds of aluminum.

66. The acquisition of Rome by Alcoa will not bring about, enhance or aggravate any so-called "price squeeze" on non-integrated fabricators of aluminum wire and cable.

67. The evidence fails to establish that either Alcoa or Rome would have become a more significant factor in the manufacture and sale of aluminum wire and cable products if the acquisition had not occurred. Neither company had definite plans to expand its aluminum wire and cable production.

[fol. 4451] 68. The following table sets forth Rome's copper and aluminum wire and cable sales during the five full years preceding the acquisition.

(Thousands of Dollars)

Year	Copper Wire & Cable	Aluminum Wire & Cable	Total	Percent Copper
1954	$27,142	$1,770	$28,914	93.9%
1955	36,921	2,458	39,379	93.8
1956	39,119	3,646	42,765	91.5
1957	26,992	2,888	29,880	90.3
1958	21,261	2,191	23,452	90.7
1959 (1st Qr.)	5,891	509	6,400	92.0

69. The evidence establishes that there is vigorous competition in the manufacture and sale of aluminum wire and cable products, that both integrated and non-integrated companies participate therein, and that there has been no reduction in the vigor of such competition since the acquisition.

70. Since Rome was not a primary aluminum producer, Alcoa and Rome did not compete in the sale of aluminum ingot whether used in the production of aluminum conductor wire and cable or otherwise.

71. Rome sold only limited amounts of aluminum redraw rod, of which only a de minimis amount was sold for electrical conductor use.

(a) Rome's sales of aluminum rod and the amounts sold for non-conductor and for conductor use are set forth in the following table:

Year	Total EC Rod Sales	Sold for Non-Conductor	Sold for Conductor Use
	(Thousands of Pounds)		
1955	5	—	5
1956	139	124	15
1957	418	341	77
1958	387	372	15

(b) In its biggest year, 1957, Rome's rod sales for conductor use amounted to only about 3/10 of one percent of aluminum bar and rod sold by domestic primary aluminum producers to non-integrated producers of conductor wire and cable in that year. In addition, at least one other non-integrated fabricator sold aluminum rod, so that Rome's sales would be an even smaller percentage of the total.

[fol. 4452] 72. The evidence fails to establish that Rome probably would have become a more significant supplier of aluminum redraw rod to manufacturers of conductor wire and cable.

73. At the time of the acquisition and for several years prior thereto, Rome was producing its own aluminum redraw rod and purchased only de minimis amounts from others.

74. The evidence fails to establish that any competing supplier of aluminum ingot or rod has been or may be adversely affected by this acquisition.

75. The evidence fails to establish any reasonable prob-

ability that Alcoa's acquisition of Rome has or will substantially lessen competition or tend to create a monopoly in any of the alleged aluminum conductor lines of commerce.

76. The pre-acquisition market percentages of Alcoa and Rome are set forth in the following table, which gives figures for 1958:

(Thousands of Dollars)

Conductor Wire and Cable	Shipments	Percent of Industry
Industry	1,553,955	
Alcoa	28,521	1.8
Rome	22,001	1.4
Alcoa-Rome	50,522	3.2
Conductor Wire and Cable, Bare		
Industry	232,280	
Alcoa	24,020	10.3
Rome	4,579	2
Alcoa-Rome	28,599	12.3
Wire and Cable, Insulated or Covered		
Industry	1,321,675	
Alcoa	4,501	.3
Rome	17,422	1.3
Alcoa-Rome	21,923	1.6
Service Drop		
Alcoa		10.8
Rome		5.1
Alcoa-Rome		15.9

77. Alcoa and Rome were not substantially competitive in the manufacture and sale of bare conductor wire and cable products.

[fol. 4453] Industry and Alcoa and Rome shipments of bare conductor (aluminum and copper) products for 1958 are shown in the following table:

(Thousands of Dollars)

	Industry Shipments	Alcoa Shipments	%	Rome Shipments	%
ACSR and aluminum cable, bare	$62,392	23,883	10.2	258	.1
Bare conductor aluminum wire	13,395	137	.1	—	—
Bare conductor copper wire and cable	156,493	—	—	4,553	1.9
	232,280	24,020	10.3	4,811	2.0

78. Alcoa and Rome were not substantially competitive in the manufacture and sale of insulated or covered wire and cable products. Both before and since the acquisition, Rome has manufactured a relatively full line of insulated wire and cable products, chiefly made from copper. Alcoa's pre-acquisition participation in the insulated wire and cable field was limited to aluminum covered line wire and multiplex cable, amounting in 1958 to 3/10 of 1 percent of total insulated or covered wire and cable shipments.

79. Alcoa's acquisition of the assets of Rea Magnet Wire Company on January 18, 1960 is without significance to any issue in this case.

80. Since Alcoa sold only aluminum bare and insulated or covered wire and cable products, the facts found with respect to the alleged aluminum conductor lines of commerce are also pertinent to the broader conductor lines of commerce.

81. The electrical wire and cable industry, including both copper and aluminum products, is characterized by vigorous competition. Upwards of 200 companies manufacture and sell electrical wire and cable, among them being many strong, well-financed and highly reputable concerns.

82. The evidence fails to establish any trend toward concentration in the manufacture and sale of wire and cable products.

[fol. 4454] 83. On the basis of 1958 Census of Manufactures data, Alcoa in 1958 had 10.8 percent and Rome 5.1 percent of total industry shipments of service drop cable. The Census figures cannot be taken as a reliable measure of industry shipments of service drop products since they do not include weatherproof wire and used as service drop which is reported to Census under a different classification. There is no evidence as to the amount of weatherproof wire used as service drop.

84. There is no company that makes only multiplex cable. On the contrary, it is only one of numerous insulated wire and cable products made by insulating companies. It is among the simplest of such products, and any company equipped to manufacture any other insulated wire and cable product, can use its existing machinery and personnel to make multiplex cable.

85. The evidence establishes that manufacturers not presently making multiplex cable constantly review their product lines, have considered entering into the manufacture of multiplex cable, and would be capable of doing so if market conditions warranted.

86. Aluminum has gained greater acceptance in multiplex cable than in any other insulated product. Prior to the acquisition, Alcoa sold only aluminum multiplex cable and Rome's multiplex cable was approximately 80 percent aluminum. The same is true as to other insulators for which data are available. Accordingly, the facts established with respect to the lack of effect of this acquisition on competition in the aluminum conductor lines of commerce are pertinent here.

87. The evidence fails to establish any reasonable probability that Alcoa's acquisition of Rome has or will substantially lessen competition or tend to create a monopoly in any of the alleged conductor wire and cable lines of commerce.

[fol. 4455] Conduit

88. There is no reliable evidence as to the pre-acquisition market shares of either Alcoa or Rome with respect to conduit, both steel and aluminum, or aluminum alone.

Based upon a 1960 Bureau of the Census report, defendants' combined share of the total conduit market in 1960 was 6.9 percent. Based upon the same report, their combined 1960 share of conduit, other than steel, including aluminum conduit, was 26.5 percent.

The evidence shows the above report is based upon a survey undertaken for the first time in 1960 and lacks conclusiveness.

89. The evidence fails to establish that the acquisition has eliminated substantial actual or potential competition between Alcoa and Rome in the manufacture and sale of conduit or aluminum conduit.

90. Prior to the acquisition, Alcoa made and sold only aluminum conduit and Rome made and sold only steel conduit.

91. Alcoa's sales of aluminum conduit in the area where Rome sold most of its steel conduit were de minimis, rang-

ing between $10,000 and $54,000 per year in the five years preceding the acquisition.

92. There are no substantial barriers to entry. Any company having extruding equipment can enter the aluminum conduit field by adding equipment needed for threading, labeling and lubricating which can be purchased for from $10 to $15 thousand.

93. The number of companies owning extrusion equipment has increased from 39 in 1950 to 110 in 1955, and to 133 in 1960.

94. It has not been shown that any company has been or will be deterred from entering the conduit field as a result of the Rome acquisition.

95. It has not been shown that purchasers of conduit or aluminum conduit have been or may be adversely affected in any way by Alcoa's acquisition of Rome.

[fol. 4456] 96. It has not been established that any non-integrated manufacturer of aluminum conduit has been or may be adversely affected by this acquisition.

97. The decline in aluminum conduit prices since about 1958 is directly related to the competitive contest between steel and aluminum conduit.

98. The pricing of aluminum conduit to be competitive with steel was initiated by Hazelwood, a non-integrated producer, in about 1958 and continues as the result of such competition.

99. There is vigorous competition in the manufacture and sale of conduit and aluminum conduit. This competition has increased appreciably in recent years owing to the wider use and acceptance of aluminum conduit.

100. The evidence fails to establish any reasonable probability that Alcoa's acquisition of Rome has or will substantially lessen competition or tend to create a monopoly in the manufacture and sale of either aluminum conduit or conduit, including both steel and aluminum, in either the United States or the eleven western states.

Conclusions of Law

1. This Court has jurisdiction of the parties to and the subject matter of this action.

2. The manufacture and sale of each of the following products or product groups constitutes an appropriate line

of commerce within the meaning of Section 7 of the Clayton Act:

Item 2. ACSR and aluminum cable, bare.
Item 4. Aluminum ingot and rod used in the production of aluminum conductor wire and cable.
Item 5. Conductor wire and cable (aluminum and copper).
Item 7. Wire and cable, insulated and covered (aluminum and copper).
Item 9. Conduit (aluminum and steel).

[fol. 4457] 3. Plaintiff has failed to prove by a preponderance of the evidence that the manufacture and sale of any of the following products or product groups constitutes an appropriate line of commerce within the meaning of Section 7 of the Clayton Act:

Item 1. Aluminum conductor wire and cable.
Item 3. Insulated or covered aluminum wire and cable.
Item 6. Conductor wire and cable, bare (aluminum and copper).
Item 8. Service drop cable (aluminum and copper).
Item 10. Aluminum conduit.

4. The United States as a whole constitutes a section of the country within the meaning of Section 7 of the Clayton Act with respect to each of the ten lines of commerce alleged in this case.

5. Plaintiff has failed to prove by a preponderance of the evidence that the eleven western state area, consisting of Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming, is an appropriate section of the country within the meaning of Section 7 of the Clayton Act with respect to either the conduit or the aluminum conduit line of commerce.

6. Plaintiff has failed to prove by a preponderance of the evidence that the effect of Alcoa's acquisition of the assets and properties of Rome may be substantially to lessen com-

petition or to tend to create a monopoly in any line of commerce in any section of the country.

7. Plaintiff has failed to prove by a preponderance of the evidence that the effect of Alcoa's acquisition of the assets and properties of Rome may be substantially to lessen competition or to tend to create a monopoly in any of the following lines of commerce, either in the United States as a whole or in the eleven western states (assuming that area to be an appropriate section of the country):

[fol. 4458] Item 2. ASCR and aluminum cable, bare.

Item 4. Aluminum ingot and rod used in the production of aluminum conductor wire and cable.

Item 5. Conductor wire and cable (aluminum and copper).

Item 7. Wire and cable, insulated and covered (aluminum and copper).

Item 9. Conduit (aluminum and steel).

8. Assuming each of the following to have been established as an appropriate line of commerce, plaintiff has failed to prove by a preponderance of the evidence that the effect of Alcoa's acquisition of the assets and properties of Rome may be to substantially lessen competition or to tend to create a monopoly therein, either in the United States as a whole or in the eleven western states (assuming that area to be an appropriate section of the country):

Item 1. Aluminum conductor wire and cable.

Item 3. Aluminum wire and cable, insulated or covered.

Item 6. Conductor wire and cable, bare (aluminum and copper).

Item 8. Service drop cable (aluminum and copper).

Item 10. Aluminum conduit.

9. Plaintiff has failed to prove by a preponderance of the evidence that the acquisition of the assets and properties of Rome by the defendant Alcoa violates Section 7 of the Clayton Act.

10. Plaintiff has failed to establish the claims or cause of action alleged in the complaint and the relief requested therein shall be and hereby is denied and this suit dismissed, and

Judgment is directed accordingly.

/s/ Stephen W. Brennan, U. S. District Judge.

Antitrust Action—Violation of Section 7, Clayton Act

Tried Feb. 5—Mar. 1, 1962; Submitted Aug. 18, 1962.

Opinion—Decided January 28, 1963

Brennan, Judge

This is a civil antitrust action brought by the United States against the Aluminum Company of America, hereinafter referred to as "Alcoa" and the Rome Cable Corporation, hereinafter referred to as "Rome" to annul the acquisition by Alcoa of the stock and assets of Rome.

The complaint in this action was filed April 1, 1960 and charges that the acquisition, above referred to, is in violation of Section 7 of the Clayton Act, 15 U.S.C. §18. The complaint seeks the usual relief in this type of case—to wit: an order of divestiture and injunction against further acqui- [fol. 4460] sitions and such other and further relief as may be just and proper. Defendants' answers, while admitting certain allegations of the complaint, deny that the transaction involved is in violation of the statute. No question is raised as to the jurisdiction of this court.

On March 31, 1959, pursuant to a prior agreement, Alcoa acquired all of the assets of Rome by an exchange of stock of the two corporations. Title to the assets of Rome was taken in a newly formed corporation also known as the Rome Cable Corporation. The new company is a wholly owned subsidiary of Alcoa and, since the acquisition, has been operated as a division thereof. The crux of the litigation arises from plaintiff's contention that the effect of such acquisition may be substantially to lessen competition or tend to create a monopoly in certain lines of commerce consisting principally of wire and cable products—all in violation of Section 7 of the Clayton Act.

Brief reference is made at this point to the defendants and the general nature of their business activities in order to afford an insight into the more detailed discussions to follow.

Alcoa is a fully integrated aluminum producer. In the manufacturing process, it refines aluminum bearing ore into primary aluminum and converts same into intermediate and various aluminum end products. It manufactures such products in several states and sells and ships same in various forms throughout the United States and in foreign countries.

Rome was incorporated in 1936. It was and is primarily engaged in the manufacture of wire and cable products in which copper was and is the predominant metal used in its operations. In 1952 Rome installed equipment for the manufacture of aluminum rod from aluminum ingot purchased from primary producers. It began producing such rod for its own use in 1953. Thereafter it began to manufacture and sell certain types of aluminum wire and cable in addition to its broad line of copper products.

[fol. 4461] The Law

Before proceeding to discuss Alcoa's and Rome's position in the markets in which they are active participants, it would seem logical to refer briefly to the legal principles involved. An understanding of the language and purpose of the statute is essential as an approach is made to the decision which must necessarily involve the recognition of the prohibitions imposed and the application of same to the facts disclosed.

The basis of this action rests upon the provisions of Section 7 of the Clayton Act, 15 U.S.C. §18, the relevant part of which is quoted below.

> "No corporation engaged in commerce shall acquire, directly or indirectly, the whole or any part of the stock or other share capital and no corporation subject to the jurisdiction of the Federal Trade Commission shall acquire the whole or any part of the assets of another corporation engaged also in commerce, where in any line of commerce in any section of the country, the effect of such acquisition may be substantially to lessen competition, or to tend to create a monopoly."

The language of the above statute, taken alone, poses problems both in its construction and application. The courts have proceeded upon a case-to-case basis to construe and apply the statute to the facts of a particular litigation. It

seems fair to state that the law involved is still in a state of development and that no formula, possessing rigidity, may be applied. This is necessarily so since the statute deals with reasonable probability in the constantly changing economy in which we live.

The recent decision of the Supreme Court in Brown Shoe Co. v. U. S., 370 U. S. 294 is, as stated therein, the first case coming before that court wherein an analysis of the scope and purposes of the statute, as it now exists, was necessary [fol. 4462] to the issue raised. It would seem to follow that reference to the holdings in that decision would be more profitable than to discuss how far the previous landmark decisions under the Sherman Act are applicable or to reconcile or distinguish decisions of circuit and district courts which had decided Section 7 cases prior to the Brown Shoe decision. The most often quoted decisions, referred to above, are either cited or are found in the notes in the Brown Shoe opinion and their application may be gathered from the text thereof.

The legislative history of the statute is discussed in the above Brown Shoe Co. decision and does not require repetition here. Such discussion appears to confirm some previously stated purposes of the statute and sets at rest certain controversies relative to the meaning and application thereof. This court's understanding thereof is summarized below and the quotations therein are, unless otherwise indicated, taken therefrom.

Congress considered that "... a rising tide of economic concentration in the American economy" was an evil to be curbed. Effective competition and the protection of small businesses were results to be accomplished. The statute was intended to supply a deficiency in the existing statute and to apply to all types of mergers. Its purpose was to curb monopolistic acts at their beginnings or incipiency rather than await their fruition and the standards for judging their legality are broader than, but may include, those applied in Sherman Act violations. All mergers however are not to be condemned. Condemnation is limited to those having "demonstrable anticompetitive effects" although such demonstration is satisfied by a probability. Certainty is not required. Proof of probability is sufficient provided the menace to competition is clear-cut as distinguished from

a temporary condition or an "ephemeral possibility". No particular tests are provided in the statute to measure either [fol. 4463] the product or geographic market. Neither are qualitative or quantitative tests controlling in measuring the effect of a merger. Both measurements must be made in the light of all the relevant factors which may vary in accordance with the facts of the particular acquisition under consideration.

In addition to the above summary of the discussion of the legislative history as gathered from the opinion in the Brown Shoe case, the decision therein, in its holdings seems to otherwise clarify the vagueness of the language of the statute and afford something of a guide to the trial courts in their application to the facts of the litigation before them.

The lines of commerce or product market may consist of both broad and submarket lines. No rigid formula exists for their determination. The realities of competition are the ultimate test. The broad market line may be extended to cover a product where there exists "the reasonable interchangeability of use or the cross-elasticity of demand between the product itself and substitutes for it". Seven "practical indicia" are set forth as factors to be considered in determining the boundaries of a submarket. They are (1) industry or public recognition of the submarket as a separate economic entity, (2) the product's peculiar characteristics and uses, (3) unique production facilities, (4) distinct customers, (5) distinct prices, (6) sensitivity to price changes, and (7) specialized vendors. The existence or nonexistence of each of the above indicia is not determinative of the problem in itself. All relevant facts must be considered and we are admonished "to recognize competition where in fact competition exists". Peculiar characteristics and uses may be one of such indicia but it is not determinative. To be of effective weight, they must be so peculiar as to render the product "non-competitive".

In determining the impact of the merger, the size of the share of the market foreclosed is not decisive unless it approaches monopoly proportions or is of de minimus effect. [fol. 4464] The market shares held by the merged companies are an index of market power to be applied in all aspects of the realities of competition in "an economically significant market". Mergers may not be condemned per se upon

the basis of such shares alone; same "will seldom be determinative". The purpose of the merger is a most important factor as is the existence of trends toward concentration in the industry. The testimony of those engaged in industry has its weight and significance although "It is competition, not competitors, which the Act protects". An evaluation of the competitive realities disclosed, based upon a pragmatic factual approach, would seem to be the obligation of the trier of the facts.

The Industry

The litigation involves principally the effect of the merger as tending to lessen competition in certain aluminum product lines of commerce. In the decision of Brown Shoe Co. Inc. v. U.S., supra, at 321, we find the following quotation: "... Congress indicated plainly that a merger had to be functionally viewed, in the context of its particular industry" and at page 329 the court refers to the examination of "economic and historical factors" as necessary to the decision. It follows that the facts must be weighed and the law applied with some understanding of the industry as a whole and the status of both Rome and Alcoa therein.

The history of the aluminum industry in this country from its beginning to World War II is for all practical purposes a history of Alcoa itself. The economic demands of World War II account for the entry of competing primary aluminum producers, the details of which may be gathered from the lengthy court decisions which involve the position of Alcoa in the business of aluminum production and the sale of aluminum products within the United States. Such details [fol. 4465] may be gathered from the decisions—U. S. v. Alcoa, 44 F. Supp. 97; U. S. v. Alcoa, 148 F. 2d 416; U. S. v. Alcoa, 91 F. Supp. 333 and U. S. v. Alcoa, 153 F. Supp. 132. It is sufficient to say that principally due to government action during the above period, Reynolds Metal Company and Kaiser Aluminum and Chemical Corporation shared with Alcoa, then and now, a place in the aluminum industry as fully integrated aluminum producers.

The above corporations are described in their activities as fully integrated in that their facilities permit the processing of the necessary materials from the mine through the intermediate stages to the finished aluminum product. Statistics

appear to be first available in the above process when same reaches the primary aluminum stage, so that for all practical purposes we are not particularly concerned with the status of industry prior to the production of primary aluminum. Three additional corporations have since 1955 joined Alcoa, Kaiser and Reynolds as such producers. These corporations —Ormet, Inc., (Olin Mathieson), Harvey Aluminum Company and Anaconda Aluminum Company, although not as fully integrated as Alcoa, Kaiser and Reynolds, are producers of primary aluminum. The above corporations are in a position to manufacture and sell aluminum billet, pig, ingot and rod which are termed intermediate products. Each of the above corporations, except Harvey, fabricates the intermediate products into numerous finished merchantable items, intended directly for consumer use. Included in such items are the wire and cable products urged as proper lines of commerce in this case. The five above companies, thus engaged in processing intermediate aluminum products, are considered as "integrated producers" as the term is used in this litigation.

[fol. 4466] An indication of the status of the above companies engaged in producing primary aluminum may be gathered from the exhibit set out below—

Aluminum Ingot Capacity Existing or Under Construction at the End of 1960
(Short Tons)

Company	Capacity	Percent of U.S. Total
United States Total	2,655,750	100.0
Aluminum Company of America	1,025,250	38.6
Reynolds Metals Company	701,000	26.4
Kaiser Aluminum & Chemical Corp.	609,500	23.0
Ormet, Inc.	180,000	6.8
Harvey Aluminum	75,000	2.8
Anaconda Aluminum Company	65,000	2.4

The above percentage of total capacity of Alcoa differs slightly from that provided by the defendant which is set at 35%. This may be accounted for by the fact that Alcoa abandoned construction of a plant in Indiana when it was apparent that there was an oversupply of capacity. No doubt production figures are more meaningful than the above since it appears that 15% of Alcoa's primary aluminum capacity was unused in 1960. Alcoa's percentage of United States primary aluminum for 1960 was 36% of

the total supply, having declined 9% from 1956. That Alcoa's percentage of such production has declined over a period of years is self-evident from the entry of new producers as indicated above but it would seem to be fair to say that the three principal producers supply around approximately 80% of such production. The record is indicative of a further increase in domestic aluminum capacity and production, both from the documentary evidence and [fol. 4467] the oral testimony. This increase would come about by entry of new producers and the increase in production capacity of Alcoa's present competitors.

Only brief reference need be made to the copper industry since it is involved only to a limited extent in this controversy. Copper products are manufactured from an ore from which intermediate products are refined and the end product eventually produced for consumer use. Like aluminum, there are companies which are so integrated as to be able to refine and produce copper products from the original ore to the finished items. Such companies sell intermediate products, such as ingot, to processors or fabricators, who then process same for ultimate use in their final form. There is no contention here that the merger involved has anti-competitive impact in the copper industry as a whole or upon the integrated copper producers or fabricators. No further discussion of the copper industry appears to be necessary.

We now turn to a brief discussion of the industry as it pertains to the particular lines of commerce involved in this litigation. The lines of commerce which are principally litigated here consist of those products capable of conducting electricity and are generally referred to as wire and cable products. While it is claimed that some of such lines involve both aluminum and copper, emphasis is placed principally upon aluminum wire and cable which are the end products of processing or fabricating an intermediate aluminum product such as ingot into the completed wire and cable which may be of various sizes, electrical conductive capacity and of different weight, size and strength.

There are a large number of firms engaged in the fabrication of wire and cable copper products. There are a lesser number of such fabricators engaged in the business of fabricating aluminum products. As the word "fabricators"

is used in this litigation, it is distinguished from the integrated aluminum and copper producers who also fabricate [fol. 4468] and sell their end products. Upwards of two hundred fabricators are engaged in the manufacture of both aluminum and copper wire and cable products. There is a vigorous competition as to wire and cable between the integrated companies among themselves and between those fabricators whose process of manufacture begins with the intermediate product purchased from a primary aluminum producer. This active competition is also evident as between aluminum and copper wire manufacturers whose product may be used interchangeably. In other words, there is a lively competition between aluminum and copper products in certain areas which is accounted for by the increasing use of aluminum products and the economic factors which apply thereto. Both the aluminum and copper industries are important factors in the present day economic and business life. They maintain effective and costly research departments designed to improve the efficiency of their products and to create new uses therefor. Both the copper and aluminum industry must meet competition at the intermediate manufacturing stage from foreign countries or concerns. Canada produces primary aluminum equal to about 35% of the total United States production and supplies a significant portion thereof which is available to this country's fabricators. European producers apparently furnish a small portion of primary aluminum for the use of American fabricators. In view of the above, no shortage in primary aluminum is foreseeable.

The Status of Alcoa and Rome in the Industry

Since Alcoa has not been engaged in the manufacture of copper products, its place in the industry, above described, is limited to the production, manufacture and sale of aluminum products. Its position in the aluminum industry is to some extent apparent in the above discussion.

[fol. 4469] Alcoa still maintains its position as the leading producer of primary aluminum. Its share in that market, as may be expected, has declined sharply since the entrance of competitors in that field. This decline has been reasonably consistent since the newcomers in the field

reached productive capacity. In 1948, Alcoa had 52% of United States primary aluminum production. It declined to 45% by 1956 and from 1956 to 1960, it declined to 36%. Its percentage of primary aluminum capacity has declined substantially in the same manner.

Alcoa manufactures and sells a variety of aluminum products. This litigation however involves primarily wire and cable products so that reference to its position in the market will be limited thereto. Alcoa pioneered the use of aluminum as an electrical conductor and sold substantially all of the aluminum cable used for electrical transmission in the United States prior to World War II. Since that time, Alcoa has encountered increased competition and its relative participation in the above market has declined materially. Its principal products in that field are bare aluminum cable and ACSR (aluminum covered steel reinforced). ACSR is a bare aluminum cable with a steel core primarily used by utilities in the overhead transmission of electric current. Alcoa's share in ACSR and bare aluminum cable declined from 48.4% in 1954 to 32.5% in 1958 and to 26.1% in 1961. Its second principal product is known as aluminum conductor wire and cable. Its share in that product declined from 42.8% in 1954 to 27.8% in 1958 and to 23.5% in 1961. The decline in the above market percentages is reasonably consistent between the dates above mentioned and continuing since the acquisition. Alcoa's third such product is known as aluminum wire and cable, insulated or covered. Its share in that item varied from 10% in 1954 to 11.6% in 1958 and to 7.3% in 1961. The comparatively recent increase in demand for covered or insulated aluminum conductor wire found Alcoa in an unfavorable market position. It manufactured line wire and multiplex cable with a polyethylene insulation or covering but it lacked [fol. 4470] the know-how and the facilities for the manufacture of the more complicated line of insulated aluminum wire and cable products.

In March 1952 Alcoa and Rome entered into a continuing agreement referred to as a "tolling agreement" whereby Rome would cover or insulate bare aluminum wire with the more complicated insulated constructions. This arrangement broadened the scope of Alcoa's ability to provide insulated wire products to its trade.

As already indicated, Rome was primarily the manufacturer of copper products, including wire and cable. It has been successful in its manufacturing efforts and expanded same so that at the time of its acquisition it had plants at Rome, New York; Torrance, California; and Collegeville, Pennsylvania. It maintained an active and efficient research department and sales organization. Prior to its acquisition by Alcoa, Rome was one of the ten largest manufacturers of copper conductor wire and cable in the United States. In 1952, Rome installed equipment for the manufacture of aluminum rod from aluminum ingot purchased from primary producers. It began producing such rod for its own use in 1953. Thereafter it began to manufacture and sell certain types of aluminum wire in addition to its broad line of copper products. In the course of its experience and research, Rome developed a special aptitude or skill in the matter of insulating wire and cable. It manufactured a relatively full line of the more complicated insulated wire and cable, designed and built to meet customers' requirements. This skill prompted the so-called "tolling arrangement" between Alcoa and Rome, referred to above.

At the time of the merger, here under consideration, only five products were manufactured and sold by both Alcoa and Rome and their direct competition in the market was limited thereto. These products may be identified as follows—(1) ACSR and bare aluminum cable; (2) covered [fol. 4471] line wire or weather-proof; (3) multiplex cable; (4) conduit; (5) aluminum redraw rod. The market shares of Rome and Alcoa in these competitive products, generally speaking, were not great and a further discussion of same may better be considered in the discussion of the impact of the merger upon or within the competitive market.

In this type of action, a burden is imposed upon the plaintiff to establish three essential elements, listed below, in order to establish a violation of the statute. (1) The relevant products markets or "lines of commerce"; (2) the geographic markets within which the impact of the merger may be measured as to each such line of commerce; and (3) the substantial lessening of competition or tendency to create a monopoly in any such line of commerce in the relevant geographic area. The proof as to these elements will be discussed in the order in which they are mentioned above.

Lines of Commerce

The Government offers proof as to ten lines of commerce and contends that each has been established thereby as applicable in this action. The defendants agree that four such lines of commerce are appropriate and disputes the relevancy of the remaining six lines and the sufficiency of the proof to establish same. There is set out below the list of specific products as contended by plaintiff, showing which are agreed upon and those in dispute. The position in which they appear below follows the order of the proof and the order in which they are discussed in the submitted briefs.

Item	1	Aluminum conductor wire and cable.	In issue.
"	2.	Bare aluminum cable and ACSR.	Agreed.
"	3.	Insulated or covered aluminum wire and cable.	In issue.
"	4.	Aluminum ingot and rod used in the production of aluminum conductor wire and cable.	In issue.
"	5.	Conductor wire and cable (aluminum and copper).	Agreed.

[fol. 4472]

Item	6.	Conductor wire and cable, bare (aluminum and copper.)	In issue.
"	7.	Wire and cable, insulated and covered (aluminum and copper).	Agreed.
"	8.	Service drop cable (aluminum and copper).	In issue.
"	9.	Conduit (aluminum and steel).	Agreed.
"	10.	Aluminum conduit.	In issue.

The Government relies in its brief upon the peculiar characteristics and uses test as the bases upon which a finding of the relevant lines of commerce may rest. This test may find support in such decisions as A. G. Spalding & Bros. Inc. v. F.T.C. 301 F.2d 585; Crown Zellerbach v. Federal Trade Commission, 296 F.2d 800 and U. S. v. Bethlehem Steel Corp., 168 F.Supp. 576 but by the decision in the Brown Shoe case, such test is but one of seven of the "practical indicia" which may serve as a guide in determining submarket lines. Even if so used, such characteristics and uses must be such as to render the product "generally non-competitive".

The consideration and determination of the lines of commerce issue is made having in mind the discussion of the problem in the Brown Shoe case and the rules or guides laid down therein and referred to above.

Items 1, 2 and 3 are generally referred to herein as the

aluminum conductor lines and are so related as to be discussed together.

Since Item 1 is a rather broad line and is simply a combination of Items 2 and 3, the latter two should first be determined. Item 2, bare aluminum cable and ACSR, is a heavy cable product which has practically displaced copper for use in overhead transmission lines. It is agreed that same constitutes a line of commerce here.

Item 3, insulated or covered aluminum wire and cable, is not a line of commerce because it is not recognized in the industry as a separate economic entity. While differing in some characteristics and preferred uses from its copper counterpart, they both perform the same functions and it is not "generally non-competitive" with copper. The Government's evidence shows in 1959 that insulated copper [fol. 4473] conductor comprised 22.8% of the gross additions to insulated overhead distribution lines. Both aluminum and copper wire may be produced interchangeably, using the same facilities. Covered aluminum wire has no distinct customers as distinguished from covered copper wire purchasers. Neither has it specialized vendors. Insulated aluminum and copper wire are generally functionally interchangeable. Their purchase and use are likewise principally dictated by economic factors. While aluminum wire and cable is sold at prices generally distinct from copper and does not have the same price sensitivity, these factors do not destroy the conclusion that covered aluminum wire and cable is in actual competition with its copper counterpart and may not be found as a line of commerce herein. A different conclusion would ignore the admonition, "But the boundaries of the relevant market must be drawn with sufficient breadth to include the competing products of each of the merging companies and to recognize competition where, in fact, competition exists".

Since Item I is a broad line embracing both Items 2 and 3 and Item 3 is held not to be a proper line of commerce, their combination cannot result in a line of commerce. To find that Item 1 is a line of commerce extends the outer boundaries of the market beyond its legal limits because covered copper wire and cable is interchangeable in use and there is cross-elasticity of the demand therefor between

insulated or covered aluminum and copper. To constitute a proper line of commerce, same must include the substitutes therefor which are reasonably interchangeable in use and for which there is a cross-elasticity of demand.

The above conclusion is fortified by the inconsistent position taken by the Government, at least as far as the vertical aspect of the merger is involved. The plaintiff contends here that insulated aluminum wire and cable is a line of commerce and therefore competitively distinct from insulated copper but agrees as to Item 7 that insulated alumi- [fol. 4474] num and insulated copper constitute a single line of commerce.

Item 4, aluminum ingot and rod, used in the production of aluminum conductor wire and cable is simply a grade of aluminum generally referred to as E.C. (electrical conductor). It is but one of 173 recognized aluminum alloys which may be manufactured interchangeably at the will of the producer. All six integrated primary aluminum producers produce various of such alloys including aluminum of E.C. grade which is required by industry standards to contain a minimum aluminum content of 99.45%. Generally the standard is met by the addition of a small percentage of boron to "a high purity pig". The purifying boron however may be added to the ingot during the course of the fabricating process. The rod represents a further product in the reduction of the ingot to the desired wire or cable size. It results from a continuing casting and rolling process and assumes a form or shape which is the starting point for most wire fabricators in their operation.

Although it may be doubtful that ingot and rod of the E.C. grade should be fragmented from the many aluminum alloys, it seems that it satisfies the most of the indicia laid down by the Brown Shoe decision and will be found as a line of commerce in this action.

Items 5, 6, 7 and 8 are generally referred to as conductor lines. They embrace both aluminum and copper wire and cable as distinguished from the four items discussed above which involve aluminum conductor only.

Item 5, conductor wire and cable (aluminum and copper), is a broad line covering all such products whether bare or insulated. Both litigants have agreed that same, together

with Item 7, wire and cable, insulated and covered, (aluminum and copper) may also be considered as a line of commerce here.

[fol. 4475] The first dispute arises when the defendants contend that the broad line, referred to above, may not be broken down by separating therefrom, as a separate line, Item 6, conductor wire and cable, bare. The court adopts such contention and holds that Item 6 does not constitute a proper line of commerce. Such a grouping would include bare aluminum wire and cable and ACSR. The Government has already asserted and agreed that such products are not competitive with copper or interchangeable therewith. In fact, these products are used in the overhead transmission field to the practical exclusion of copper. Grouping them together in Item 6 does not define a single product market. The Bureau of the Census has established separate product classifications for bare copper and for bare aluminum wire and cable. Because a broad line of commerce may be proper does not mean that it may be broken down into all possible fragments.

The proof as to Item 8, service drop cable (aluminum and copper), asserted by the Government as a line of commerce, is rather confusing. As so urged, it is referred to as multiplex cable and consists of one or more insulated conductors twisted around a cable or uninsulated conductor. This contention seems to again recognize that insulated aluminum is not competitively distinct from insulated copper wire and cable.

The product is or can be made by any manufacturer equipped to produce insulated wire or cable and is simply a separation of a particular item from the many other insulated products. Its use is primarily to carry electricity from the distribution point of the utility to the home or business place of the user and as secondary distribution lines carrying no more than 600 volts. The most popular type is of triplex construction and same is displacing open wire or weatherproof wire as a more popular product for service drop, especially in new construction. The evidence is inconclusive as to amount of product known as service drop as distinguished from its use for other purposes including secondary distribution. As just indicated, weatherproof wire is still used as a service drop product from the utility

pole to the entrance of the user's premises. No reliable data is available as to the extent of such use at the times [fol. 4476] relevant here. Two other types of cable, known as type "K" and type "SD" are presently used for the above purpose in particular localities. It would seem that to constitute a line of commerce, the substitutes for multiplex cable for secondary distribution use, weatherproof and the two types of cable, referred to above, may not be eliminated from consideration as a part of the service drop product line. Their absence, together with a consideration of the indicia, referred to herein, leaves the proof something less than convincing. If a product line is designated in terms of function, it must include all competitive substitutes accomplishing the same result. The Item is held not to be a relevant line of commerce herein.

The Geographic Market

The litigants have agreed that in respect to all of the above lines of commerce, whether or not allowed as such herein, the United States as a whole constitutes a section of the country within the contemplation of Section 7 of the Clayton Act.

Item 9, conduit (aluminum and steel), has been agreed upon as a line of commerce. This item includes both rigid conduit and electrical metallic tubing (EMT). It is simply a metallic enclosure to protect lines or cables carrying electric current from outside injury or harm.

Controversy again arises in the matter of the Government's contention that the above broad conduit line may be separated by a submarket line of aluminum conduit alone. The contention is based principally on the separate characteristics and uses test. This single test, as indicated above, is not conclusive; in fact it is not applicable where such characteristics and uses do not render it generally noncompetitive. Here the great weight of evidence is to the effect that aluminum and steel conduit are in direct and vigorous competition for the consumer trade. They are functionally interchangeable; alternate quotations are frequently sought by consumers and they react or are related in price change to each other. Aluminum conduit, taken [fol. 4477] alone, fails to meet the majority of the pre-

scribed tests as a separate submarket and the contention of plaintiff that Item ten is a relevant line of commerce is rejected.

The Geographic Market

There is no dispute but that the United States as a whole is an appropriate section of the country in which the impact of the merger may be considered as to both steel and aluminum conduit and aluminum conduit alone. The Government claims however, that eleven western states (Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming) also constitute an appropriate geographic market for both of the above products. The claim is based upon the fact that the greater portion of Rome's total sales of conduit prior to the merger was made to customers within that area. The above statement is also true as to sales made after the merger. The evidence fails to show that such sales were made in that area as a particular market. Rome's sales expanded from a six state area to a fourteen state area. The above eleven state area was used because data within same was available for comparison purposes. The evidence shows that freight rates and commercial realities are such that outside or eastern producers can ship conduit within the eleven state area and compete effectively with western producers.

In other words the purchaser within that area can turn for supplies to a producer located in any section of the country. Tampa Electric Co. v. Nashville Co., 365 U.S. 320 at 327. The eleven state area is rejected as a proper geographic market in which to measure the impact of either conduit lines of commerce.

[fol. 4478] The Competitive Effect of the Acquisition

The competitive effect of the acquisition upon the relevant lines of commerce, referred to above, is not determined in accordance with a rigid formula. Guides are furnished in the Brown Shoe decision and the cases cited therein. Reference will be made to those which seem to be pertinent here and will be applied to all claimed lines of commerce whether or not allowed as above.

Purpose

The "nature and purpose of the arrangement" is referred to as a most important factor and will first be discussed since it necessarily involves the participants' competitive problems and something of the background of the defendants previously referred to herein.

Alcoa was the prime mover in bringing about the acquisition. Its share in the aluminum market had declined as referred to herein. Its return on invested capital had declined from 9.3% in 1950 to 3.7% in 1961. It admittedly lacked the "know-how" to manufacture the more complicated types of insulated wire and cable for which there was a growing demand. Its principal wire and cable product was ACSR and bare aluminum cable. The need for product diversification was apparent. Rome was known to Alcoa as a substantial organization with special competence in the insulating field. The time required to obtain such competence from within its own organization and the expense involved seemed to foreclose such a program. Rome was first approached and negotiations failed. An engineering company was retained to explore the market to obtain an organization which would furnish the "know-how" in the insulated wire and cable field. Negotiations were reopened with Rome and the acquisition followed. Competition between Rome and Alcoa was limited to four wire and cable products. Rome's production thereof was not significant in amount.

[fol. 4479] All of the above indicates an effort to overcome a market disadvantage rather than to obtain a captive market for its product or to eliminate a competitor. The terms of the contract itself indicates an intention to retain Rome after the acquisition as an active participant in the market which it occupied.

Concentration

Another factor deemed important in providing a factual background for weighing the probable effect of the acquisition is the trend toward concentration in the industry involved. The Government contends that such a trend exists insofar as the aluminum conductor lines of commerce are

involved. In support of the contention, emphasis is placed upon the fact that the combined shares of the market produced by the five integrated producers is roughly averaged at 80%. This fact loses its significance when it is realized that the production of aluminum and the fabricating of its products were concentrated to the point of a monopoly less than twenty years ago and has undergone a gradual decentralization by the entry of new producers and fabricators since that time.

Alcoa has no history of acquisitions or mergers prior to the acquisition of Rome. Alcoa acquired equipment or assets of three other corporations but aluminum wire and cable products were not involved therein and same could in no way contribute to a concentration in that industry.

The Government cites the acquisition by Olin-Mathieson of the Southern Electric Corp. in 1957. The acquisition by Kaiser in the same year of the U. S. Rubber Co. plant at Bristol, R. I. and the acquisition of John A. Roeblings' Sons Co. by Reynolds in 1961 as indicating a merger trend. When examined, the facts hardly support such an indication. Olin-Mathieson manufactured no aluminum wire and cable products prior to its acquisition of Southern. U. S. [fol. 4480] Rubber's market share of said products was 0.8% and Roebling's share was never over 0.1% prior to their acquisition by Kaiser and Reynolds as above. More significantly as indicating lack of competitive impact in the product market referred to is the post-acquisition market shares of the above acquiring and acquired companies which show a decline therein as does the Alcoa-Rome market share.

The market situation as to the two principal aluminum conductor lines of commerce can be summarized by stating that as to ACSR and bare aluminum cable, the number of producers of those products increased from Alcoa, alone, in 1940 to twelve such producers in 1950 which number is practically unchanged to date. There were about four producers of insulated wire and cable in 1951 (although government allotments of aluminum for that purpose were issued to eight) and as of April 1, 1961, there were twenty-nine producers of such products.

Ease of Entry

Closely related to the question of trends of or concentration in the aluminum conductor lines of commerce is the question of the existence of barriers to the entry of additional competitors in that particular branch of the industry. This is sometime referred to as the "ease of entry."

The facts already stated above demonstrate that no serious impediment or barrier exists which would bar the entry of producers of wire and cable products. This is accounted for principally for the reason that similar techniques and the same machinery with but slight alterations may be used in the production of such copper and aluminum products. The fact that in ten years the number of producers of insulated wire and cable have risen from four to twenty-nine and most of the new entrants came from the ranks of insulated copper conductor producers is indicative that entry into the aluminum conductor field is dictated by the status of the competition rather than being controlled by actual [fol. 4481] economic barriers. That some companies have ceased making this product is not determinative. "It is competition, not competitors, which the Act protects." The evidence discloses that the withdrawal of certain producers from the production of this item was occasioned by an inability to make a profit and there is no evidence which would indicate that any potential producer has been unable to enter the industry when he thought that a profit could be made therein.

There is no doubt that problems are presented in the matter of the entry of a producer in the ACSR and bare aluminum cable market. The product itself involves specialized techniques and equipment especially in the larger sizes used in the overhead transmission field. In spite of difficulties, there are now twelve such producers, one of whom plans an extension of its facilities. The situation in the industry as to the ease of entry of competitors therein is of course not determinative but is simply another factor to be considered in the appraisal of the problem as a whole.

Market Shares

The market shares which Alcoa and Rome may control by the acquisition is one of the most important factors to be

considered. Since the shares in each line of commerce (whether allowed or not) are discussed in the briefs, they will be set out here and the ultimate conclusions to be drawn therefrom will be found in the detailed findings to be filed in connection with this opinion.

In 1958, the Alcoa and Rome market percentages in the three principal aluminum conductor lines as claimed by plaintiff appear below.

[fol. 4482]

	Alcoa	Rome
ACSR and Aluminum Cable, Bare	32.5	.3
Aluminum Wire and Cable, Insulated or Covered	11.6	4.7
Aluminum Conductor Wire and Cable	27.8	1.3

The decline in the combined market percentages of Alcoa and Rome in the above products appears below, which shows a generally continued decline therein both pre and post-acquisition.

				Decline (Percentage Points)		
	1954	1958	1961	1954-58	1958-61	1954-61
ACSR and Aluminum Cable, Bare	48.6	32.8	26.1	15.8	6.7	22.5
Aluminum Wire and Cable, Insulated or Covered	16.9	16.3	13	.6	3.3	3.9
Aluminum Conductor Wire and Cable	43.9	29.1	24.8	14.8	4.3	19.1

In 1958 the market percentage of Alcoa and Rome in the four conductor (aluminum and copper) lines of commerce are set out below.

	Alcoa	Rome
Conductor Wire and Cable	1.8	1.4
Conductor Wire and Cable, Bare	10.3	2.
Wire and Cable, Insulated or Covered	.3	1.3
Service Drop	10.8	5.1

The plaintiff contends that the above percentage table should be increased by the shipments of conductor wire and cable made by the Rea Magnet Wire Co. for 1958. This company was acquired by Alcoa in 1960. Same would seem unimportant from a competitive standpoint since its product was entirely copper wire of small size used principally in coils, transformers, etc. It made no product which competed with Rome. If such products were added, it would [fol. 4483] increase the total of Alcoa and Rome by 1.1%

for conductor wire and cable and 1.3% for wire and cable, insulated, and actually add little or nothing to the significance of the percentages involved.

There is no evidence that the market shares in the conductor lines of commerce have increased or diminished since the acquisition. It would be speculative to assume that the percentages have changed appreciably except perhaps in the case of service drop which is composed principally of aluminum as the conductor and would seem to be included within the insulated or covered aluminum wire line and therefore subject to the post-acquisition decline therein.

In the conduit lines of commerce, no probative preacquisition market data is available. At that time, Alcoa made only aluminum conduit while Rome made only steel conduit. Based upon a survey first made about 1960, Alcoa's share in the conduit market (aluminum and steel) was 3.4% and Rome's share was 3.5%. In aluminum conduit alone, the survey shows that in 1960 Alcoa's market share was 12.0%, and Rome's as agent for Alcoa was 14.5%. These later figures should not be construed as showing that Rome in the post-acquisition period actually manufactured aluminum conduit. It had no extruding facilities. The above percentage apparently represents sales of aluminum conduit completely manufactured by Alcoa but sold by Rome as its agent and conduit pipe produced by Alcoa and threaded at the California plant of Rome. The accuracy of the above market shares is seriously questioned by defendants which, together with their incompleteness, afford little, if any, basis for a finding of the effect of the acquisition upon competition in either of the alleged lines of commerce whether or not allowed as such.

The market shares of the defendants in aluminum ingot and rod line of commerce appear to be inconclusive. Rome was not a producer of primary aluminum and did not compete in that market. Rome's purchase of primary aluminum amounted to .2% of the total industry production and [fol. 4484] .3% of Alcoa's production. Rome manufactured its own rod and additionally sold a small amount thereof for conductor use to non-integrated producers of wire and cable. Percentagewise, such sales amounted to a fraction of one percent of the market.

Industry Evidence

In Brown Shoe, as in several other reported decisions, industry evidence as to the actual or potential effect of the acquisition upon suppliers and purchasers has been considered as a factor in determining the effect of the acquisition upon suppliers and purchasers. There is an entire absence of such evidence on the part of the Government. The passage of almost three years from the time of acquisition to the time of trial would seem to bring to light the anti-competitive effect of same if in fact it existed. Evidence to the contrary appears in the record. The defendants, through some eight or more witnesses, actively engaged in the aluminum wire and cable industry—all testified without exception that the acquisition has not had an adverse effect upon the purchasers of such products. No difficulty has been encountered in expanding their list of suppliers and that competition among such suppliers has not been affected.

The Dominant Position of Alcoa

Throughout the trial and in the submitted briefs, the Government has taken the position that Alcoa occupies a dominant position in the production of primary aluminum and in the manufacture of aluminum conductor wire and cable products. It is urged that this acquisition has enhanced that position and is therefore a factor in determining the competitive effects thereof. So much reliance is placed thereon that a brief discussion would seem appropriate.

Undoubtedly Alcoa is large in size, both physically and financially. Its activities are varied and extensive. Care [fol. 4485] however must be taken not to exaggerate its influence because of its size alone, especially in the absence of evidence of the abuse of the power which goes with size. U.S. v. U. S. Steel Corp., 251 U. S. 417; U. S. v. Swift & Co., 286 U. S. 106. The mere intrusion of "bigness" into a competitive market will not in itself violate the statute. Reynolds Metal Co. v. F.T.C., 309 F. 2d 223 at 230. Here the Government's contention as to the dominance of Alcoa appears to rest upon size alone without evidence as to the exercise of the power that goes with it. In 1957, Judge Cashin in U. S. v. Aluminum Company of America, 153 F. Supp. 132 at 167 found as a fact that Alcoa's relative share

of the aluminum market had declined at that time. That such decline has continued to date appears without contradiction in this case. An increase in the money value of products sold means nothing in the light of the increase in the total market and the decline in the rate of return on Alcoa's invested capital. The increase in the number and market shares of primary aluminum producers and wire and cable producers all point to the conclusion that Alcoa's position in the above markets is something less than dominant. In any event, if Alcoa has the power to dominate, the record fails to show that such power has been used to its own advantage. The position of Alcoa in the above mentioned markets is relevant in this proceeding as a part of the overall picture upon which the decision must be based but this court sees nothing therein from which it could find that such position and the use thereof are indicative of forbidden anti-competitive practices.

The Competitive Impact

In appraising the impact of the acquisition, we turn first to the relationship between Alcoa and Rome as a source of supply and as direct competitors.

[fol. 4486] The customer-supplier relationship, referred to as the vertical aspect, requires little comment. Rome's purchase from Alcoa of primary aluminum was about 3/10 of one percent of Alcoa's production of that product. This small amount is without significance from a competitive standpoint but indicates rather clearly that the acquisition did not involve the purchase by Alcoa of a captive market.

The market area in which both the acquiring and acquired companies manufactured and sold competing products was limited to four or five items previously mentioned herein. The combination of the manufacturing and selling facilities of the two companies on these items involves the horizontal aspect of the acquisition in its actual and probable effects upon competition.

In ACSR and bare aluminum cable, Rome's pre-acquisition share of the market was 0.3%. In fact, Rome competed only in the smaller sizes of the product while Alcoa manufactured and sold a full line thereof. The products known as covered line wire or weatherproof and multiplex

cable may be discussed together. These products have many end uses but are limited here to "service drop" which has been rejected as a line of commerce. In 1958, Alcoa's share in the service drop market, according to the figures of the Census of Manufacturers was 10.8% and Rome's was 5.1%. These figures do not however include the product known as weatherproof wire, also used as service drop, which was reported under a different classification. Pre-acquisition figures are not available as to the market shares of the defendants in the product known as conduit. During the above time period, Rome manufactured steel conduit, both rigid and thin or electrical metallic tubing (E.M.T.). Alcoa manufactured rigid aluminum conduit and aluminum E.M.T. so that competition between them was in effect the competition between steel and aluminum. The nature and extent of the inter-defendant competition, resulting from the above, may be gathered from the discussion of the market shares of [fol. 4487] the defendants in the conduit lines of commerce as contained herein and needs no repetition here. The same may be said of the item of redraw rod. The extent of the competition therein may also be gathered from the brief discussion herein of market shares of defendants in that item."

Considered only from the manufacturing level, the comparatively small percentages of the market which Rome held in the overlap or competing products would not alone condemn the acquisition especially in view of the purpose and the other relevant factors previously discussed.

The principal contention urged as violative of the statute arises from the premise that the integrated producers are involved in a struggle for monopoly power with the non-integrated producers as their opponents. The argument proceeds to the conclusion that the acquisition adds to the numerical and market strength of the integrated companies especially in the aluminum lines of commerce and is therefore to be condemned.

Without doubt, an integrated company enjoys advantages over its non-integrated competitor. Such advantages would include the ability to sell intermediate products as well as end or fabricated products. Thus at least two opportunities to make a profit are available. They are able to offer a broader line of products to the trade and their sales organ-

izations are likewise given more latitude and sales techniques extended. These advantages are not necessarily conducive to competitive strength in the lines of commerce involved. The financial outlay required, the obtaining and holding of the required skills, the constant research and experimentation, which are required of the seller of intermediate products, are burdens which the fabricator avoids but the integrated producer must carry.

The arraying of the integrated companies on one side and the non-integrated companies on the other overlooks entirely the active and vigorous competition among the integrated companies. In Alcoa's analysis of its lost business [fol. 4488] from 1957 to 1959, it appears that the larger portion of same was lost to integrated producers. Its loss of business to Rome during the same period was insignificant. Previous government action was designed to facilitate the entry of manufacturing competitors of Alcoa's products. Now that such competitors have come into existence, the realities of competition dictate that same may not be ignored or distorted in appraising the competitive market as a whole.

Plaintiff presents statistics tending to show that the market shares of the integrated companies in the aluminum conductor lines of commerce have increased from 1955 to 1959 while the shares of the non-integrated companies have decreased during the same period. This is accounted for principally by the addition of Anaconda and Olin-Mathieson (Ormet) to the list of integrated producers. More significant however is the fact that since the acquisition and up to 1961, the non-integrated companies have held or increased their market shares in the lines under discussion while the shares of the Alcoa-Rome combination have declined. In the ACSR and bare aluminum cable and aluminum conductor wire and cable lines, the non-integrated producers have retained their shares of the market, while the share of Alcoa-Rome in ACSR has dropped from 32.8% to 26.1%. In aluminum conductor, the non-integrated producers have retained their market shares while the share of Alcoa has decreased from 29.1% to 24.8%. In the insulated or covered line of commerce, the non-integrated producers market share has increased from 29.8% to 33.5% while the share of Alcoa-Rome has declined from 16.3% to 13.0%.

The above is proof of what has actually happened in the competitive market. It is a competitive reality much more convincing than arguments based upon speculative future market conditions. When such facts are supported by the oral testimony of utility purchasing agents and non-integrated manufacturers to the effect that the acquisition has not adversely affected their businesses, a finding of a sub-[fol. 4489] stantial lessening of competition is precluded. The fact that some four or five non-integrated producers have reduced or abandoned their aluminum conductor wire business since 1956 is offset by the entry of at least one new company and increase in their productive facilities by four others. The reduction in or abandonment of the manufacturing of these products were brought about principally by an inability to make a profit therein. This situation tends to confirm rather than to negate the existence of a vigorous competition in the products involved.

The plaintiff advances the argument that the acquisition has eliminated the "potential competition" which would have existed if Rome and Alcoa had separately expanded their facilities so as to include additional aluminum products or increased the production of the overlapping competing products. Like many business concerns, the defendants undoubtedly were constantly reviewing their product lines and exploring the possibilities of expansion. There is no evidence however that either had reached a firm conclusion that such an expansion had or would meet with the necessary approval of those in authority. Expansion from within rather than by acquisition may be preferable from the economist's point of view but the statute makes no such prohibition. The substantial lessening of competition, either actual or probable, is the test.

Considerable discussion is found in plaintiff's brief to the effect that this acquisition increased the problem of a "price squeeze" by the integrated producers or by Alcoa in particular. The discussion proceeds upon the theory that the price of primary aluminum to the fabricators may be so increased that they will be unable to make a profit from sale of the end products. This court does not understand just how the acquisition could affect the problem. Rome was not a primary aluminum producer and its acquisition by Alcoa did not affect either the production or price of that

product. Certainly the fabricator would like to buy his basic material as cheap as possible. This contention ignores the [fol. 4490] competition between primary aluminum producers and seems to assume without evidence to support it that such producers will abandon by an unconscionable pricing arrangement the market for primary aluminum and be content to sell only the end product. This overlooks entirely the present competitive situation among primary aluminum producers, the government required allotment of primary aluminum, and the availability of Canadian and foreign intermediate aluminum products. The argument is purely speculative and without evidence to support it.

Although the above discussion applies particularly to the three alleged aluminum conductor lines of commerce, the factors considered would also apply to aluminum ingot and rod used in the production of aluminum conductor wire and cable and to service drop cable which are urged as proper lines of commerce here by the plaintiff. No separate discussion of the competitive effect of the acquisition upon those two lines of commerce is necessary. While service drop is made with either an aluminum or copper conductor, the aluminum type presently predominates. The ease of entry into the business of manufacturing of service drop and the evidence that the Alcoa-Rome share of the market in insulated or covered aluminum conductor, which includes aluminum conductor service drop, has diminished since the acquisition, in particular prompts the conclusion that the acquisition does not violate the statute insofar as the service drop and aluminum ingot may be involved.

The competitive effect of the acquisition in the three principal conductor (aluminum and copper) lines of commerce is not particularly stressed in the plaintiff's briefs or argument. The market shares of Alcoa and Rome therein are not impressive. Alcoa's higher percentage of the market in conductor wire and cable, bare, is made up of ACSR and bare aluminum cable which comprises all but one-tenth of one percent of its market share. Rome's share in the same item (lacking one-tenth of one percent) is made up of bare conductor copper wire and cable which are not com- [fol. 4491] petitive with ACSR as indicated in the discussion of ACSR as an appropriate line of commerce. There is no evidence of post-acquisition trends in the lines now

considered. Likewise there is no evidence that the market, broadened by the inclusion of the competition afforded by the over two-hundred wire and cable producers (both aluminum and copper), will suffer actual or probable anti-competitive effects. There is evidence that such market comprises many strong and vigorous competitors. Alcoa obtained by the acquisition a diversification of its product line by the addition of Rome's copper wire and cable products. Rome however remains as the same source of supply of such products. Considering the same factors discussed herein and applying same to the items presently referred to leads to the conclusion that the statute is not violated as to the three conductor lines of commerce referred to above.

The approach to the consideration of the competitive effect of acquisition upon the conduit lines of commerce is handicapped by the absence of reliable market data. The Brown Shoe case opinion, in referring to the Congressional intent, uses the language "demonstrable anticompetitive effects" as the type of mergers to be invalidated by the statute. Prior to the acquisition, Alcoa manufactured only aluminum conduit, Rome only steel. We have no evidence of the pre-acquisition share of either company in the market. We do have a hesitating and inconclusive estimate of Rome sales in the eleven western states which is rejected as a proper geographic market. The available post-acquisition data lacks the reliability upon which a demonstrable anticompetitive effect may rest. In 1960, the Bureau of the Census compiled figures that defendants' market share of conduit, both steel and aluminum, was 6.9%. This percentage was allocated 3.4% to Alcoa and 3.5% to Rome. The same report attributes the defendants' combined share of aluminum conduit at 26.5%. The above was the first such survey made by the Bureau and forms [fol. 4492] for same were sent only to those who designated themselves as producers of conduit in 1958 and 1959. The evidence shows that at least three aluminum producers entered the conduit field in the 1958-1960 time period.

Again plaintiff appears to stress the status of the defendants in the aluminum conduit line as having anticompetitive effects. Although aluminum conduit has been rejected as a relevant line of commerce here, brief comment will be made relative thereto. Entry to the aluminum con-

duit market requires only an outlay of ten to fifteen thousand dollars by those producers owning extruding equipment. In 1950, there were fifty such owners. The number increased to one hundred and ten in 1955 and to one hundred thirty-three in 1960. The ease of entry is further corroborated by the substantial number of new producers of aluminum conduit in recent years. This is due to the increased demand for the product and provides an active competitive market therein. There is a failure of proof to show that the statute is violated by the acquisition as to either of the conduit lines of commerce as claimed by the plaintiff.

Using the pragmatic practical approach, an appraisal of the acquisition here involved designates same as the combination of an aluminum and an essentially copper manufacturing company. Such an acquisition implies advantages to the acquiring company. Such advantages are not to be condemned unless they portend or approach monopoly proportions. It is the loss to competition rather than the advantage gained that invokes the statute here. Alcoa gained an increase in its scientific knowledge and ability in insulating techniques and a diversification of its line of salable products. This would seem to be a legitimate end in the face of its declining market. There is less need than usual to speculate here upon the effect of the acquisition upon competition. Not only do we have industry evidence as to the actual effect from competitors and purchasers but we also have the factual results of almost three years of market experience. After consideration of all of the evi- [fol. 4493] dence offered herein, it is concluded that the acquisition by Alcoa of the capital stock of Rome has not been shown to be in violation of Section 7 of the Clayton Act; that the claim of the complaint has not been established and that same should be dismissed.

This opinion, together with the Findings of Fact and Conclusions of Law, to be filed herewith, will constitute the Findings and Conclusions of this court and judgment is directed accordingly.

So ordered.

Stephen W. Brennan, United States District Judge.

Re: United States of America vs. Aluminum Co. of America and Rome Cable Corporation-Civil No. 8030

Dear Sirs:

As you know, the defendants moved under the provisions of 52(b) F.R.C.P. that this court make four additional findings of fact to supplement the findings already filed. I have received the plaintiff's memo in opposition. Same has been considered and it is concluded that the motion should be granted.

Accordingly, I enclose copy of the instrument making the requested additional findings, the original of which was filed in the Clerk's office today.

Additional Finding No. 1 was not opposed by the Government and requires no comment.

Additional Findings Nos. 2 and 3 are opposed by the plaintiff principally because the product line was not found by the court to be a relevant line of commerce. I think the finding should be made for the reason if an appellate court finds that I am in error, as to the line of commerce issue, the findings tend to show facts which would be relevant in determining the effect on competition therein.

[fol. 4499b] I think that additional Finding No. 4 is intended to broaden the holding in the original opinion and decision to the determination that aluminum conductor wire and cable is not a line of commerce considered as either a "broad line or submarket line." The opinion and findings, as originally made, seem to limit the consideration of the product as a broad line. I am in entire agreement that the item cannot be found as a narrow or submarket line and I am making the finding for the purpose of settling that question.

Very truly yours, Stephen W. Brennan, U.S. District Judge.

SWB/ec, encl.

[fol. 4500] IN UNITED STATES DISTRICT COURT, NORTHERN DISTRICT OF NEW YORK.

Civil No. 8030

UNITED STATES OF AMERICA, Plaintiff,

v.

ALUMINUM COMPANY OF AMERICA AND ROME CABLE CORPORATION, Defendants.

ADDITIONAL FINDINGS OF FACT—February 21, 1963

Pursuant to a motion made by the defendants under the provisions of 52(b) Federal Rules of Civil Procedure, the court makes the additional Findings of Fact which are set out below, same to be considered as supplemental to the Findings and Conclusions previously filed.

1. Because of the closer manufacturing controls required, E. C. grade aluminum, like other alloys, is sold at a premium; however, the price of E. C. aluminum ingot changes directly and correspondingly with the basic price of aluminum ingot.

2. In 1956, the year of Rome's greatest primary aluminum purchases, such purchases amounted to less than 7/10 of 1 percent of total primary aluminum sold to non-integrated fabricators.

3. In view of the ability of aluminum producers to make E. C. and other types and alloys of aluminum interchangeably in accordance with orders received, there is no basis for an inference that other producers will be foreclosed from a substantial market for primary aluminum as a result of Alcoa's acquisition of Rome.

4. Item 1, aluminum conductor wire and cable, excludes insulated copper products and therefore does not include all wire and cable products for which there is reasonable interchangeability of use or cross-elasticity of demand. In addition, the evidence fails to establish that the combination of [fol. 4501] bare and insulated aluminum wire and cable, considered as a whole, is generally recognized in the industry as a seperate economic entity or submarket; nor, in

view of facts found with respect to Item 3, insulated or covered aluminum wire and cable (Findings 25 to 29, inclusive; Opinion pp. 14-15) does the evidence establish that aluminum conductor wire and cable, including both bare and insulated products, has competitively significant peculiar characteristics and uses, is made on unique production facilities, or is sold by specialized vendors to a distinct class of customers.

Stephen W. Brennan, United States District Judge.

UNITED STATES OF AMERICA, Plaintiff,

v.

ALUMINUM COMPANY OF AMERICA AND ROME CABLE CORPORATION, Defendants.

NOTICE OF APPEAL TO THE SUPREME COURT OF THE UNITED STATES—Filed March 29, 1963

I. Notice is hereby given that the United States of America, the plaintiffs above named, hereby appeals to the Supreme Court of the United States from the final judgment entered in this action on January 28, 1963 dismissing this action. This appeal is taken pursuant to Section 2 of the Expediting Act, 32 Stat. 823, as amended, 15 U.S.C. 29.

II. The Clerk will please prepare a transcript of the record in this cause for transmission to the Clerk of the Supreme Court of the United States, and include therein the entire record before the district court including all

papers filed with the Clerk of the Court in this proceeding, the transcript of the trial proceedings, all exhibits and proposed findings submitted by the parties, and this Notice of Appeal.

III. The question presented by this appeal is whether the acquisition by the Aluminum Company of America of the capital stock and assets of Rome Cable Corporation violated Section 7 of the Clayton Act.

Leon E. Hickman,
Vice President
& General Counsel
Victor R. Hansen, Esquire,
Assistant Attorney General,
Antitrust Division,
United States Department of Justice,
Washington, D. C.

Dear Judge Hansen:

I hand you herewith a loose leaf notebook containing most of the data requested in your letters of February 2nd addressed to Alcoa and Rome Cable Coporation concerning the acquisition of the assets of Rome by Alcoa. The two companies are submitting this single reply because your letters make the same requests of both and ask each for data which can only be supplied by the other. A word of explanation as to the omissions:

Rome is in the electrical conductor business. Alcoa is in the aluminum business on a fully integrated basis, from foreign bauxite and steamships to automobile pistons, building panels and cooking utensils, to mention only five of hundreds of items covered by your questions but which have nothing to do with the electrical conductor business. To spare ourselves a task which would have required months of effort on the part of a great many people and to save you the chore of sorting relevant from irrelevant data, we have taken the liberty of limiting your questions, insofar as they apply to Alcoa, to electrical conductor products and those products which underlie them. This limitation has been applied specifically in answering your questions numbered 9, 10, 11, 17 and 21.

For the same reason Alcoa's response to questions 6, 7 and 8 has been limited to companies, plants and products which are concerned with electrical conductor products or a product underlying them.

[fol. 4506] In answering the first question we did not include congratulatory personal letters between officials at the time of the Alcoa-Rome agreement or the correspondence since the agreement relating to the mechanics of transferring the Rome properties to Alcoa.

I believe we have supplied you all the information which is relevant to the questions raised by your letter. If you need further data, we shall do our best to be cooperative.

With cordial regards, I am

Sincerely, Leon E. Hickman, Vice President & General Counsel.

PLAINTIFF'S EXHIBIT 5

Aluminum Company of America

Pittsburgh 19, Pa.

January 21, 1959.

Frank L. Magee,
President
Rome Cable Corporation,
Rome,
New York.

Gentlemen:

Aluminum Company of America (Alcoa) offers to acquire from Rome Cable Corporation (Rome) all the assets, properties, contract rights, business and good will of Rome (herein collectively called assets), of every kind and description and wherever located, for a consideration of 355,226

shares of common stock of Alcoa and the assumption by Alcoa of all debts, obligations, liabilities and contract duties of Rome (herein collectively called liabilities). The transaction we propose would be an acquisition of assets for stock and not a statutory merger or consolidation.

We are agreeable to having the transaction effected in such a way as to be a non-taxable reorganization under the provisions of the United States Internal Revenue Code, and, if you request, would condition any agreement resulting from acceptance of this offer upon your obtaining a favorable ruling from the Internal Revenue Service in this respect.

The obligation of Alcoa arising out of acceptance of this offer shall be subject to the conditions that Rome shall have taken all such corporate action as shall be necessary for the performance of its obligations thus arising; that Rome have good and marketable title to all the assets which it purports to transfer and that such assets are subsisting on the day of closing; that Rome shall not have incurred any obligations, disposed of any assets or engaged in any transactions after March 31, 1958, other than in the ordinary course of business; that, except for liabilities incurred in the ordinary course of business after March 31, 1958, there shall be no liabilities other than such as are shown on the published balance sheet of Rome as of March 31, 1958; and that, as of the day of closing, there shall have been no change in the condition of Rome, financial or otherwise, as shown in the said balance sheet as of March 31, 1958, other than changes which occurred in the ordinary course of business and did not have a material adverse effect on Rome's business, properties or financial condition.

[fol. 4508] The obligation of Rome arising out of acceptance of this offer shall be subject to the conditions that the shares of common stock of Alcoa to be acquired by Rome shall be validly issued and that, as of the day of closing, there shall have been no change in the condition of Alcoa, financial or otherwise, as shown in its published balance sheet as of December 31, 1958, other than (1) changes which occurred in the ordinary course of business and (2) changes which occurred outside the ordinary course of business but did not have a material adverse effect on Alcoa's business, properties or financial condition.

The agreement to be executed by Alcoa and Rome, if this offer is accepted, shall contain such other and further terms, provisions, conditions and warranties as are normally contained in such agreements.

This offer, which is made by authority of the Executive Committee of the Board of Directors of Alcoa, is open for acceptance on or before January 31, 1959, and may be accepted by the signing and returning of the enclosed duplicate copy of this letter.

Very truly yours, Aluminum Company of America,
By Frank L. Magee, President.

The foregoing offer is accepted this 22nd day of January, 1959.

Rome Cable Corporation, By /s/ A. D. Ross Fraser, President.

[fol. 4509] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 6

Aluminum Company of America

January 21, 1959.

Mr. A. D. Ross Fraser,
President,
Rome Cable Corporation,
Rome, New York.

Dear Ross:

If the directors and shareholders of Rome Cable Corporation approve the sale of your company to Alcoa, the most challenging opportunity confronting us both is how to consolidate personnel to the best advantage. When we were last together, we spent more time on that than any other matter. We have continued to give it a priority in our thinking because, above all else, we want to maintain the high esprit de corps of the Rome organization and to open to every man and woman in your organization improved op-

portunities under the new program. Our thinking runs along the following lines:

(1) *All manufacturing and selling activities of Rome Cable Corporation conducted at Rome, New York, will be continued in that location.*

(2) *A new corporation, to be known as Rome Cable Company, will be formed to take over the properties of the present Rome company.* Its Board of Directors would necessarily consist of a small number of Rome and Alcoa officers selected with an eye to functional coordination of activities. You and the present officers of Rome Cable Corporation will be expected to hold the same offices in the new company as you hold in the old, subject only to such changes as time and changing circumstances indicate would be in our common interest. Likewise, the rest of your organization will be carried over intact into the new company. Initial salaries in the new company would be the same as in the old, subject to such adjustments as joint study indicates to be equitable. Alcoa employee benefits will be made available to Rome employees as promptly as they qualify, as we discussed in some detail when you were in Pittsburgh.

[fol. 4510] (3) *We would expect to consolidate in the new company all electrical wire, cable and conduit activities of both Rome and Alcoa.* This will greatly expand the scope of activity, and, consequently, the responsibility and opportunity of the Rome organization. For example, the transfer to it of Alcoa's bare conductor business alone will greatly enlarge its operations. We would expect to move into the new company additional products in the electrical conductor field or related areas as we gain experience in working together. Insofar as products new to Rome are moved into its orbit, it will probably be advisable to transfer experienced Alcoa personnel to the Rome operation.

(4) *The new company will operate functionally as a Division of Alcoa.* In addition to full responsibility for products manufactured directly by it, it will have a functional responsibility for such Alcoa products as are manufactured, through the existing Alcoa organization, in Alcoa plants but sold by the Rome organization. Quite possibly, the activities of the new company will subdivide into five

categories: (a) insulated wire, (b) bare conductor, (c) accessories, (d) conduit, and (e) Cope.

(5) *We would expect the new company to continue the present sales organization of Rome, subject only to such modifications as experience might indicate to be in the common interest.* Insofar as Rome selling activity is expanded by merchandising Alcoa products, experienced Alcoa personnel will be available for transfer to the Rome Company. We regard the effective consolidation of the marketing organization of the two companies as one of our major problems if we are to gain the full benefit of our proposed agreement. However, we are certain that this can be achieved, as our Pittsburgh discussions indicated.

(6) *Purchasing.* We would expect the purchasing activities of the new company, particularly in copper and steel for conduit, to be handled through its own organization, but in coordination with Alcoa's purchases in the same or related fields.

(7) *Research.* Both Rome and Alcoa are research-minded. We would expect the new company to continue the Rome Research Center in Rome, but to greatly expand its usefulness by coordinating its programs with the research staff of Alcoa.

(8) *Modifications in the light of experience.* I am sure you realize that while we speak in complete candor and good faith, these policies must always be subject to modification or change as experience may dictate. A rigid commitment on these points would be no more in your interest than ours; [fol. 4511] for example, tax considerations may ultimately make it advisable to liquidate the new company into Alcoa and, thereafter, operate it as one of the Divisions of Alcoa. Some of your people are quite likely to find additional opportunities for advancement in the Alcoa organization. No decision can be reached now as to where it would be advisable to manufacture new products or additional production of existing products.

There is an element of faith in this, as in all worthwhile matters. We are counting on your people, strengthened by the support that Alcoa can give them, to develop the wire and cable business of Rome well beyond its present poten-

tial. We can go far together if we maintain a mutual confidence and a willingness to adapt our program to changing circumstances. Subject only to those inevitable contingencies, this letter expresses our full thinking to date.

With cordial regards, I am

Sincerely, /s/ Frank L. Magee, President

FLM:frl

[fol. 4512] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 7

Rome, New York—January 22, 1959.

WESTERN UNION

W. P. Marshall, President

Rome Cable Corporation and Aluminum Company of America today announced plans to affiliate.

Frank L. Magee, President of ALCOA and A. D. Ross Fraser, President of Rome Cable, announce that agreement had been reached on a plan by which ALCOA will acquire all the properties of Rome Cable for 355,226 shares of ALCOA common stock. This will permit distribution to Rome shareholders of 3 shares of ALCOA common stock on each 5 shares of Rome common stock. The agreement is contingent upon the approval of Rome Shareholders who will meet on March 25, 1959. If approved, it will take effect immediately.

ALCOA and Rome plan to combine their electrical conductor, conduit and accessory activities in a new company to be called Rome Cable Company. The present members of Rome's management will continue in their present capacities in the newly formed company. Mr. H. T. Dyett will retire as Chairman of the Board of Rome Cable, when and if the agreement is consummated, rather than at the Annual Meeting in June as previously planned, but he will serve on the Board of Directors of the new company.

ALCOA plans to continue the fundamental policies established by the Rome management, and no major changes in personnel or operating procedures are anticipated.

Rome Cable Corporation shares currently are listed on the New York Stock Exchange. The company has approximately 2500 share holders. Rome Cable's net sales for the year ending March 31, 1958 amounted to $40,615,000. Annual sales have averaged $47,000,000 over the past five years. The company has approximately 1500 employees. It operates manufacturing plants at Rome, New York, Torrance, California, and Collegeville, Pa., as well as sales offices in principal cities of the United States. Rome is best known for its broad line of quality insulated wire and cable products—chiefly made of copper—and steel conduit and other wiring systems. Its products are sold to electric utilities, electrical manufacturers, other wire fabricators, industrial users, wholesalers, mines and oil companies. A number of specialty products are made for the military services, especially for use in the missile program.

Rome Cable was founded twenty-three years ago and has grown rapidly during that time. It is well known in the electrical industry for the emphasis it has placed on research and development activities. During 1958 the company opened a new research center at Rome, New York in order to stimulate further progress in the development of new products and new and improved manufacturing processes and practices. Nearly 40 per cent of the company's sales during the year ending March 31, 1958 came from items that Rome did not manufacture prior to 1950.

[fol. 4513] For more than sixty years ALCOA has pioneered the development of aluminum as an electrical conductor. It produces aluminum wire and cable, bus conductors, conductor accessories, conduit and windings of aluminum sheet and foil for electrical transformers and condensers. One of the company's research laboratories is devoted exclusively to the development of new products and processes for the electrical conductor industry.

"Our proposed affiliation with ALCOA", Mr. Fraser said, "is very much in the best interests of Rome's employees, share owners and customers. It will make possible more complete service to customers by taking advantage of

the combined production and marketing of ALCOA's line of aluminum conductor products as well as bare and insulated wire and cable products produced by Rome. The coordinated research and development activities of Rome and ALCOA will provide improved services to the electrical industry."

"The plan that will be submitted to Rome's shareholders", Mr. Magee said, "will make possible greatly improved service to the rapidly growing electrical industry. For many years Alcoa has specialized in the production and sale of bare aluminum conductors with emphasis on the popular aluminum cable steel reinforced (ACSR) for electrical transmission and distribution lines. More recently Alcoa has been offering a limited line of insulated aluminum conductors. Rome Cable's complete facilities for the production and sale of many types of insulated wire and cable as well as bare copper conductors will fully complement Alcoa's facilities and enable the new organization to meet the increasingly complex requirements of the electrical industry."

Pacific Coast Stock Exchange, 301 Pine Street, San Francisco 4, Calif. Mr. Thomas P. Phelan, Exec. V.P., Pacific Coast Stock Exchange, 618 South Spring Street, Los Angeles, Calif.

Mr. James R. Leedham, New York Stock Exchange, Department of Stock List, 11 Wall Street, New York, New York. Dow Jones & Co. Inc., 44 Broad Street, New York, New York.

PLAINTIFF'S EXHIBIT 8

Rome Cable Corporation, Rome, N. Y.

January 23, 1959.

Telephone statement by A. D. R. Fraser, President of Rome Cable Corporation to Mr. Paul Windels, Jr. the Regional Administrator of Securities Exchange Commission—New York

On October 20, 1958 in the course of a regular business call on Mr. Ralph V. Davies, Vice President and Director of the Aluminum Company of America, Pittsburgh, Pa., I was asked the question if we were interested in an affiliation with ALCOA, and if so if we would set a price. I stated I would check with Mr. H. T. Dyett, Chairman of the Board of Rome Cable. As a result, Mr. H. T. Dyett, Chairman of the Board, J. H. Dyett, Executive Vice President and I, A. D. Ross Fraser, President of Rome Cable met in New York on October 29, 1958, with Mr. R. V. Davies and Mr. L. E. Hickman, both Vice Presidents and Directors of ALCOA. At that time we indicated that the matter had not been discussed with our Board, and a figure was given to Messrs. Davies and Hickman.

On Friday, October 31, 1958 Mr. Davies called Mr. H. T. Dyett and stated that our proposed figure was too high. Mr. H. T. Dyett stated that in view of the fact that the matter had not been submitted to the Board of Directors of Rome Cable, and in fairness to share owners of Rome Cable, would ALCOA indicate a figure which they felt was more satisfactory.

No meetings or negotiations of any sort were held until Wednesday, January 14, 1959 in Pittsburgh, Pa., at which time Messrs. I. W. Wilson, Chairman of ALCOA, Frank L. Magee, President, Ralph V. Davies, Vice President, Leon E. Hickman, Vice President, all four of whom are Directors of ALCOA and Philip T. Coffin, Manager Electrical Industry Sales, met with John H. Dyett, Executive Vice President, Gerard A. Weiss, Secretary and me, A. D. Ross Fraser,

President of Rome Cable Corporation. This conversation resulted in ALCOA making a verbal offer to Rome Cable Corporation on that day of buying the assets for a total of 355,226 shares of ALCOA Common Stock. Written proposal from ALCOA did not reach us in Rome until Tuesday, January 20, 1959. Favorable action on the proposal was taken by the Board of Directors of Rome Cable during the morning of January 22, 1959.

/s/ A. D. R. Fraser, President.

Proxy for Special Meeting of Share Owners

Know all men by these presents, that the undersigned, a holder of Common Stock of Rome Cable Corporation, hereby constitutes and appoints Harry W. Barnard, Herbert T. Dyett, and A. D. Ross Fraser, and each or any of them, with power of substitution, and in place of each, in case of substitution, his substitute, the attorneys, agents and proxies for and in the name, place and stead of the undersigned, to attend at the special meeting of the holders of Common Stock of said Corporation to be held at the office of said Corporation, 421 Ridge Street, Rome, New York, on Wednesday, March 25, 1959, at 10:00 o'clock A. M., and at any and all adjournments thereof, and to cast the number of votes the undersigned would be entitled to vote.

(a) In favor of ☐

Against ☐

approving and ratifying the Plan and Agreement, dated February 17, 1959, entered into by Rome Cable Corporation and Aluminum Company of America and Authorizing the taking of all necessary or convenient and proper steps, in-

cluding without limitation the filing of appropriate certificates with the Secretary of State of the State of New York, to effectuate said Plan and Agreement, all as set forth in the notice of special meeting, dated March 3, 1959, and in the proxy statement accompanying said notice, copies of which have been received by the undersigned; and

The Board of Directors Recommends a Vote in Favor of the Proposed Plan.

(b) upon any and all other business that may lawfully come before the meeting,

hereby revoking any proxy heretofore given designating others to act in respect of the same shares.

This Proxy is to be Voted in Favor of the Proposal Referred to in Clause (a) Above, Unless the Undersigned Has Indicated a Direction for a Contrary Vote by His Mark Placed in the Brackets Following the Word "Against", in Which Event This Proxy Shall be Voted Accordingly.

A majority of said attorneys, agents and proxies, or their substitutes, who shall be present and act at the meeting (or, if only one should be present and act, then that one) shall have and may exercise all the powers hereby conferred.

This proxy delegates discretionary authority in respect of all matters which may come before the meeting, not known or determined at the time of mailing the notice of meeting.

In Witness Whereof, the undersigned has executed this instrument this — day of March, 1959.

—— ——.

Please make the signature or signatures on this proxy conform with names stencilled hereon.

If shares are held in joint names, please sign this proxy with the names of both owners.

When signing as Attorney, Executor, Administrator, Custodian or Guardian, please give your full title as such.

Note: Stockholders who do not expect to attend the meeting are requested to fill in, sign and return promptly, this Proxy, which is solicited on behalf of the Management of the Corporation. Please use the post-paid envelope enclosed for your convenience.

[fol. 4516] Rome Cable Corporation,
Rome, N. Y.

To Our Share Owners:

It was announced on January 22, 1959 that the Board of Directors of your Company had unanimously voted to refer to share owners an offer from Aluminum Company of America (Alcoa) to acquire all the assets of Rome Cable for 355,226 shares of Alcoa common stock.

There is enclosed with this letter a Notice of a Special Meeting of Share Owners, to be held March 25, 1959, together with a Proxy and a Proxy Statement. An affirmative vote of share owners representing two-thirds of the outstanding common stock of Rome is required to approve the purchase agreement. The vote of every share owner is important. Therefore, if you do not expect to be able to attend the special meeting please sign and return the enclosed proxy in time to reach us prior to March 25, 1959.

Alcoa is the country's largest and oldest producer of aluminum and aluminum products. It is fully integrated. More than sixty years ago Alcoa pioneered in the use of aluminum as an electrical conductor and ever since that time has been active in the development of new aluminum products and processes for the electrical industry. Within this field Alcoa today specializes in the manufacture of bare steel reinforced aluminum cable for electrical transmission lines.

On the other hand, your Company has specialized in the manufacture of copper wire and cable for a wide variety of uses. It was also one of the pioneers in the production of insulated aluminum conductor.

The management of Rome Cable has given the most careful consideration to Alcoa's offer and is strongly of the opinion that acceptance of this offer is in the best interest of the share owners of Rome Cable. The enclosed Proxy Statement gives you detailed financial information on each company and also a summary of the ranges of the prices of common stock of each company during 1957 and 1958 and for the first two months of 1959. If the share owners accept Alcoa's offer, you acquire stock in a diversified fully integrated aluminum producer.

Alcoa proposes to operate the Rome properties through

a new Company which will headquarter in Rome and will bear that name. This new Company, led by Rome's present management and combining Rome's experience in copper with Alcoa's know-how in aluminum, will be in a position to serve the fast growing electrical industry more comprehensively than either of the two companies can do today. Both Alcoa and Rome are research minded; we believe the coordination of Rome and Alcoa research and development activities in the electrical field will lead to the creation of new products for and improved services to electrical product users.

If the agreement is approved, Rome's share owners will receive six-tenths (6/10) of a share of Alcoa common stock for each share of Rome common stock as soon after share owners' approval as the transaction can be consummated.

Your management urges you to vote *in favor of* the proposals to be considered at the special meeting of share owners and to sign and send in your proxy promptly, if you are unable to attend the special meeting in person.

By Order of the Board of Directors, Rome Cable Corporation, H. T. Dyett, Chairman of the Board, A. D. R. Fraser, President.

March 3, 1959

[fol. 4517] Rome Cable Corporation

Notice of Special Meeting of Share Owners to be Held March 25, 1959

Notice is Hereby Given that a Special Meeting of Share Owners of Rome Cable Corporation will be held at the office of the Corporation, 421 Ridge Street, Rome, New York on Wednesday, Mareh 25, 1959 at 10:00 A. M., Eastern Standard Time, for the following purposes:

(1) To consider and, if deemed advisable, to approve and ratify a certain Plan and Agreement dated February 17, 1959 entered into by Rome Cable Corporation and Aluminum Company of America and, for the purpose of effectuating such Plan and Agreement and in accordance with the provisions thereof:

(a) To authorize the transfer of all or substantially all of the assets of Rome Cable Corporation to Aluminum Company of America or a wholly-owned subsidiary of Aluminum Company of America for such number of shares of common stock of Aluminum Company of America as shall be equal to six-tenths (6/10) of the number of shares of common stock of Rome Cable Corporation outstanding at the time of such transfer (and within three months thereafter by virtue of the exercise of certain options to purchase common stock of Rome Cable Corporation) and the assumption by Aluminum Company of America or by such subsidiary of Aluminum Company of America of the liabilities of Rome Cable Corporation;

(b) To authorize and consent to, subject to effecting such transfer, the dissolution of the Corporation in accordance with the provisions of Article 10 of the Stock Corporation Law of the State of New York and the distribution to the share owners of Rome Cable Corporation, in complete liquidation thereof, of the shares of common stock of Aluminum Company of America, received upon such transfer, upon the basis of six-tenths (6/10) of a share of Aluminum Company of America for each share of Rome Cable Corporation;

(c) To authorize the amendment of the Certificate of Incorporation of Rome Cable Corporation so as to change the corporate name to "RTC Liquidating Corporation"; and

(d) To authorize any and all other action necessary or desirable and proper to carry out such Plan and Agreement and effectuate the purposes thereof.

(2) To transact such other business as many properly come before the meeting or any adjournment thereof.

A copy of said Plan and Agreement is included in the Proxy Statement annexed to this Notice.

The Board of Directors has fixed the close of business on

February 27, 1959 as the record date for the determination of share owners of the Company entitled to notice of, and to vote at, the meeting.

By order of the Board of Directors, Gerard A. Weiss, Secretary.

March 3, 1959

Note: Share owners who do not expect to attend the meeting are requested to fill in, date, sign and return promptly, the accompanying Proxy, *which is solicited on behalf of the Management of the Corporation.* Please use the post-paid envelope enclosed for your convenience.

[fol. 4518] Rome Cable Corporation

Proxy Statement for Special Meeting of Share Owners to be Held March 25, 1959

This statement is furnished in connection with the solicitation of proxies by the management of Rome Cable Corporation (hereinafter sometimes called Rome, Rome Cable or the Corporation) to be voted at a Special Meeting of Share Owners of the Corporation to be held on Wednesday, March 25, 1959, and at any and all adjournments thereof, at the office of the Corporation, 421 Ridge Street, Rome, New York, for the purposes set forth in the accompanying Notice of Special Meeting of Share Owners dated March 3, 1959. A proxy in the form submitted herewith may be revoked by the person giving it at any time before its exercise.

The shares represented by the proxies received and not revoked will be voted in accordance with the specifications made on such proxies, or in the absence of specific instructions, they will be voted in favor of the proposed Plan and Agreement.

The Proposed Plan and Agreement

The Special Meeting of the Share Owners has been called to consider and take action upon a proposed Plan and Agreement (hereinafter called the Plan) between the Corporation and Aluminum Company of America (hereinafter some-

times called Alcoa or the Company) which contemplates the transfer by the Corporation of all or substantially all of its assets to a wholly-owned subsidiary (hereinafter referred to as Subsidiary) of Alcoa or to Alcoa in exchange for shares of common stock of Alcoa equal in number to six-tenths (6/10) of the shares of the Corporation's common stock outstanding at the time of such transfer (or within three months thereafter by virtue of the exercise of options to purchase shares of common stock of the Corporation) and the assumption by the Subsidiary or by Alcoa of the Corporation's liabilities, the subsequent dissolution of the Corporation and the distribution of such shares of Alcoa common stock to the Corporation's share owners in complete liquidation, on the basis of six-tenths (6/10) of a share of Alcoa common stock for each share of the Corporation's common stock.

A copy of the Plan is annexed hereto as Exhibit A. Any summaries contained in this Proxy Statement of any of the provisions of the Plan do not purport to be complete statements of such provisions and are qualified in their entirety by reference to such Exhibit.

The Plan provides that its consummation is subject to certain conditions, including the receipt of opinions of counsel with respect to various legal matters, and there having been, prior to closing, no changes in the condition of the Corporation, financial or otherwise, as shown in its balance sheet as of March 31, 1958, other than changes which occurred in the ordinary course of business, and none of such changes (other than as reflected in the Corporation's balance sheet as of December 31, 1958) having had a material adverse effect on the Corporation's financial condition, results of its operations or its properties, and there having been, prior to closing, no changes in the condition of Alcoa, financial or otherwise, as shown in its balance sheet as of December 31, 1958, other than (i) changes which occurred in the ordinary course of business, and (ii) changes which occurred outside the ordinary course of business but did not have a material adverse effect on Alcoa's financial condition, results of its operations or properties.

The Plan contemplates that the transfer of the Corporation's assets in exchange for stock of Alcoa will take place on March 31, 1959, if approved by the share owners of the

Corporation. However, under the terms of the Plan, either the Corporation or Alcoa may postpone the closing to a date not later than April 30, 1959. Alcoa and the Corporation, by mutual consent, may postpone the Closing Date beyond April 30, 1959. If, by mutual agreement of Alcoa and the Corporation, the period within which the closing may be held is extended beyond April 30, 1959, the shareholders of the Corporation may direct the termination of the Plan by the affirmative vote of holders of record of a majority of the outstanding shares of the Corporation represented and voting at any annual meeting of shareholders of the Corporation held after December 31, 1959, if the period of such [fol. 4519] extension has not expired or the closing shall not have been held prior to the date of such annual meeting. By mutual consent, the Boards of Directors or the Executive Committees of Alcoa and the Corporation may terminate the Plan at any time and may amend or modify the Plan; provided, however, that no such amendment or modification shall change the number of shares of common stock of Alcoa to be delivered to the Corporation under the Plan or make any material change in the provisions of the Plan relating to the transfer of the Corporation's assets to and the assumption of its liabilities by the Subsidiary and the distribution to the Corporation's shareholders of such shares of common stock of Alcoa against surrender by such shareholders for cancellation of their certificates for outstanding shares of common stock of the Corporation, or alter the shareholders' right to terminate the Plan as provided therein.

In determining that the proposal and the consideration offered to Rome by Alcoa were fair and should be submitted to Rome stockholders the Board of Directors of Rome took into account, among other things, the financial records of Rome and Alcoa (including earnings, dividends and book values), the anticipated potentials of each Company with respect to the future, the increasing importance of aluminum to the electrical industry, and the relative market values of the shares of both companies.

There are and have been no material relationships between the Corporation or any of its officers or directors on the one hand and Alcoa or any of its officers or directors on the other hand other than normal relationships of buyer and

seller of products and services. Alcoa is a partial supplier of aluminum pig to the Corporation. Total purchases of aluminum pig represent approximately 3% of the Corporation's total purchases of raw materials. The Corporation performs certain services for Alcoa with respect to the covering of aluminum wire and cable, the revenue from which in 1958 constituted about 2% of the Corporation's gross sales.

The management recommends that the share owners vote in favor of the Plan, for the reasons given above and for the reasons given in the letter from Mr. H. T. Dyett, Chairman of the Board of the Corporation and Mr. A. D. R. Fraser, President of the Corporation, which letter accompanies this proxy statement and in which the Board of Directors concurs.

The Assistant Attorney General in charge of the Antitrust Division of the United States Department of Justice has requested information from both the Corporation and Alcoa concerning the proposed transactions, the plants and products of both companies and other matters. In the letters requesting this information it was stated that while the proposed transaction does raise certain questions under the Antitrust Laws, the letter was not meant to imply that there would necessarily be a violation of such laws.

Promptly after the transfer of the Corporation's assets, notice thereof will be mailed to share owners of the Corporation, accompanied by instructions with respect to the surrender of their certificates for shares of stock of the Corporation in exchange for certificates for shares of common stock of Alcoa.

Fractional Interests

In the distribution of Alcoa common stock upon the liquidation of the Corporation no fractional shares will be issued, but arrangements will be made with an exchange agent so that for a period of 120 days after the effective date of the transfer of the Corporation's assets, a holder of certificates for shares of stock of the Corporation who would otherwise be entitled to a fractional share, may, upon surrender of his certificate or certificates of common stock of the Corporation, give instruction to the exchange agent to purchase the

additional fractional share required to make up a full share or to sell the fractional share to which he is entitled. If no instruction for the purchase or sale of a fractional interest is given upon surrender of the certificate for shares of stock of the Corporation, the exchange agent will sell any such fractional interest for the account of the holder thereof.

After the expiration of the 120 day period the exchange agent, as agent for all share owners of the Corporation who are, according to the stock transfer books and records of Rome as of the close of business on the day of the expiration of such period, entitled to a fractional interest in any share of Alcoa common stock, will sell shares of Alcoa common stock equivalent to the aggregate of fractional share interests of such share owners. Thereafter such share owners will, to the extent that they have any rights with respect to fractional shares of common stock of Alcoa, be entitled only to their proportionate share of the net proceeds realized by the exchange agent in the aforesaid sale of shares of common stock of Alcoa.

[fol. 4520] Federal Tax Status

Counsel to the Corporation have advised the Corporation that in their opinion no gain or loss for Federal income tax purposes will be recognized to the Corporation upon consummation of the transactions provided for in the Plan, or to the share owners of the Corporation upon the distribution to them, in liquidation, of whole shares of common stock of Alcoa as contemplated by the Plan; but that, in the case of holders of common stock of Rome Cable Corporation who sell fractional interests in shares of common stock of Alcoa, gain or loss will be recognized for Federal income tax purposes. A ruling to this effect, based upon the assumption that the Subsidiary will acquire the assets of the Corporation directly from the Corporation, has been received from the Office of the Commissioner of Internal Revenue (U. S. Treasury Department). A ruling to the same effect, based upon the assumption that Alcoa elects, pursuant to its right under Section 5.4 of the Plan, to acquire the assets of the Corporation and to transfer them thereafter to the Subsidiary, has been requested from the Office of the Commissioner of Internal Revenue (U. S. Treasury Department).

Voting Securities and Vote Required

The only outstanding voting securities of the Corporation as of February 27, 1959, consisted of 561,802 shares of Common Stock, each share of which entitles the holder to one vote. Since the Plan contemplates the transfer of substantially all of the Corporation's assets and the dissolution of the Corporation, the approval of the Plan requires, under New York law, the affirmative vote of holders of record of two-thirds of the outstanding shares of the Corporation entitled to vote thereon.

Common Stock of Rome Cable Corporation

Dividend rights

The holders of common stock are entitled to such dividends as the Board of Directors may determine to pay out of funds available therefor, subject, however, to the limitations imposed by the promissory notes from the Corporation to The Connecticut Mutual Life Insurance Company, Massachusetts Mutual Life Insurance Company and J. P. Morgan & Co. Incorporated, dated as of July 25, 1957. As of December 31, 1958 the amount so available was $2,052,000. See note C of the Notes to the Corporation's Financial Statements, p. 28.

Voting rights

Each share of common stock has one vote.

Liquidation rights

After creditors have been satisfied, the common stock is entitled to the balance of the assets.

Preemptive rights

Except as otherwise provided by statute and except with respect to the issuance of shares covered by the Corporation's stock option plan (See caption "Stock Option Plan", page 12), the holders of common stock have preemptive and subscription rights.

Liability to assessment

The outstanding shares of common stock are fully paid and non-assessable, except that stockholders of every New

York corporation are (in the event of nonpayment by the Corporation) personally liable for debts, wages or salaries owing to employees other than contractors for services performed for the Corporation.

Change of Corporate Name

It is contemplated that the Alcoa subsidiary which acquires the Corporation's business upon consummation of the Plan will thereafter continue such business under the name "Rome Cable Corporation" or other name including [fol. 4521] the name "Rome". Accordingly, it is proposed to change the present name of Rome Cable Corporation to "RTC Liquidating Corporation" by amending its Certificate of Incorporation immediately prior to or promptly after the transfer of the Corporation's assets.

Comparisons of Net Income, Dividends Declared and Book Values

The following tabulation compares the net income, dividends declared and book values per share of common stock of Rome and Alcoa and, since the exchange contemplated by the Plan is at the rate of 6/10 of a share of Alcoa common stock for each share of Rome common stock, the tabulation also shows the net income, dividends declared and book value equivalent to 6/10 of a share of Alcoa common stock. Since Alcoa's fiscal year is the calendar year and Rome's fiscal year ends March 31, a direct comparison for identical periods is not possible. Therefore, the comparison shown in the following tabulation is of periods having the greatest time in common—a comparison of Alcoa data for a calendar year with Rome data for the fiscal year ending the following March 31, providing a common period of nine months. Thus, each year shown in the table below refers to the following periods: for Alcoa—its fiscal year ending on December 31 of such year; for Rome—its fiscal year ending on March 31 of the following year, except that, in the case of 1958, Rome's data are for the calendar year ending December 31 and were determined as set forth in Note 3 to the table.

	Alcoa		Rome
Net Income:	Per Share (1)	Per 6/10 of a Share (1)	Per Share (2)
1954	$ 2.95	$ 1.77	$ 1.57
1955	4.18	2.51	3.64
1956	4.24	2.54	4.04
1957	3.55	2.13	1.82
1958	1.96	1.18	.65 (3)
Dividends Declared:			
1954	.80	.48	1.19
1955	1.05	.63	1.29
1956	1.20	.72	1.39
1957	1.20	.72	1.30
1958	1.20	.72	1.00
Book Value:			
Dec. 31, 1958	$30.09	$18.05	$28.91

(1) Net income per share or per 6/10 of a share is based upon the number of shares of common stock outstanding at the end of each year after giving effect to the dividends declared on the preferred stock and after giving effect to the 2-for-1 common stock split-up in 1955. Dividends declared per share and per 6/10 of a share are stated after giving effect to the 2-for-1 common stock split-up in 1955.

(2) Net income per share and dividends declared per share are based on the number of common shares outstanding at the end of each period after giving effect to stock dividends of 10% in 1956 and 5% in 1957.

(3) Net income of Rome for the calendar year 1958 has been constructed by adding to the unaudited figures for the nine-month period ending December 31, 1958 the computed figures for the first three months of 1958 derived by subtracting from audited figures for the year ending March 31, 1958 interim unaudited figures for the nine-month period ending December 31, 1957.

The pro-forma net income per share of common stock of Alcoa for the year ended December 31, 1958, based upon a combination of the income of Alcoa and Rome (the net income of Rome having been computed as set forth in foot note (3) above) and reduced by the sum of (i) the assumed applicable amortization of the excess of the aggregate market value of the shares of common stock of Alcoa to be issued over the net book value of the assets of Rome to be acquired and (ii) the dividends declared on the preferred stock of Alcoa, divided by the total number of shares of common stock of Alcoa which would have been outstanding at December 31, 1958 assuming all Rome shares outstanding and under option were exchanged for Alcoa common stock as proposed, amounts to $1.89. The pro-forma net income equivalent to 6/10 of a share of Alcoa common stock so computed is $1.13.

[fol. 4522] The pro-forma book value per share of common stock of Alcoa at December 31, 1958, based upon a combina-

tion of the net assets of Alcoa and Rome increased by the excess of the aggregate market value of the shares of common stock of Alcoa to be issued over the net book value of the assets of Rome to be acquired, and reduced by the sum of (i) the assumed applicable amortization of the above excess and (ii) the redemption value of the preferred stock of Alcoa, divided by the total number of shares of common stock of Alcoa which would have been outstanding at December 31, 1958, assuming all Rome shares outstanding and under option were exchanged for Alcoa common stock as proposed, amounts to $30.98. The pro-forma book value equivalent to 6/10 of a share of Alcoa common stock so computed is $18.59.

Market Prices

From August 9, 1937 until July 24, 1957 the common stock of the Corporation was admitted to dealing on the American Stock Exchange (formerly called New York Curb Exchange). On July 24, 1957 the common stock of the Corporation was admitted to dealing on the New York Stock Exchange and dealing in the stock on the American Stock Exchange ceased. The following table sets forth the reported high and low sales prices, for the periods indicated, of the common stock of the Corporation on the American Stock Exchange through July 23, 1957 and thereafter on the New York Stock Exchange, and for the common stock of Alcoa on the New York Stock Exchange, and it also sets forth the market values of 6/10 of a share of Alcoa common stock, based upon the market prices of a whole share of Alcoa common stock.

	Alcoa Common Stock				Rome Cable Common Stock	
	Per Share		Per 6/10 of a Share (1)		Per Share	
	High	Low	High	Low	High	Low
1957 First Quarter	93¾	80	56¼	48	29⅛	26
Second Quarter	100⅞	88½	60½	53⅛	29⅜	26
Third Quarter	102	71¾	61¼	43	32	26¼
Fourth Quarter	77½	59¾	46½	35⅞	26¾	20⅞
1958 First Quarter	74½	60⅜	44¾	36¼	21⅞	18½
Second Quarter	71⅜	62½	42⅞	37½	21⅛	17¾
Third Quarter	90	69⅛	54	41½	23⅞	20¼
Fourth Quarter	96½	82⅜	57⅞	49⅝	32½	22
1959 January 1 thru February 27, 1959	93¾	81	56¼	48⅝	47⅞	30½

(1) Adjusted to the nearest ⅛.

On February 27, 1959 the closing price on the New York Stock Exchange for the common stock of Rome Cable Corporation was $46.50 per share and the closing price on the New York Stock Exchange for the common stock of Alcoa was $83.125 per share. The market value of 6/10 of a share of common stock of Alcoa, based upon the closing price on February 27, 1959, was $49.875.

[fol. 4523] Rome Cable Corporation

Summary of Earnings

The summary of earnings with respect to the five years ended March 31, 1958, has been examined by Ernst & Ernst, independent public accountants, whose report thereon appears in this Proxy Statement. The summary, insofar as it relates to the three years ended March 31, 1958, should be read in conjunction with the financial statements and related notes included in this Proxy Statement. The unaudited figures for the nine months periods ended December 31, 1958 and 1957, include all known adjustments, which consisted solely of normal recurring accruals, considered necessary for a fair presentation of the results for the periods indicated, but are not presented as being indicative of the sales and operating results that may be expected for the full fiscal year.

	Nine Months ended December 31, 1958 (Unaudited)	Nine Months ended December 31, 1957 (Unaudited)	Year ended March 31, 1958	1957	1956	1955	1954

Note—Reference is made to Note E of Notes to Financial Statements.

Materials represent a high percentage of the sales dollar of Rome's products. During the above period copper, the largest material component, climbed from 30 cents in 1954 to a world price of 54¢ in 1956 and fell to approximately 20 cents in early 1958 thus making wide swings in dollar volume not truly reflecting physical volume. As an example, while sales dollars for the year ended March 31, 1956 actually increased 45% above the previous year the physical volume increase was only 18%. The drastic and steady decline in world price of copper accentuating need for customer inventory liquidation caused an earlier reduction in incoming order volume in the copper fabrication business than was true of industry generally. Unrealistic competitive price reductions despite sizable operational cost reductions affected earnings in fiscal year 1957 and 1958.

[fol. 4524] Aluminum Company of America and Consolidated Subsidiary Companies

Summary of Consolidated Income

The following summary of consolidated income (including the related notes) of Aluminum Company of America and consolidated subsidiary companies has been examined by Lybrand, Ross Bros. & Montgomery, independent certified public accountants, whose opinion with respect thereto appears elsewhere in this Proxy Statement. The summary should be read in conjunction with the consolidated financial statements and related notes of Aluminum Company of America and consolidated subsidiary companies appearing elsewhere herein.

	Years				
	1958	1957	1956	1955	1954
			(In thousands)

Net income applicable to Common Stock	$ 40,410	$ 73,093	$ 87,146	$ 85,126	$ 59,400

Notes:

(A) Provision for depreciation and depletion of properties, plants and facilities and amortization of intangible assets included in costs and expenses, expressed in thousands, were as follows: 1958—$65,660; 1957—$57,659; 1956—$50,771; 1955—$45,114; and 1954—$40,653.

(B) Beginning with the year ended December 31, 1956, the last-in first-out method was adopted for determining cost of substantially all inventories, instead of the average cost method theretofore generally used. Also, at December 31, 1956, intercompany profits in inventories, which had previously been computed and eliminated in consolidation before considering income taxes payable by subsidiaries on such profits, were eliminated on an after-tax basis. The combined effect of these changes on the net income for 1956 was not material.

The Company and consolidated domestic subsidiary companies have used the sum-of-the-years-digits method of computing depreciation of property assets acquired since December 31, 1953, in lieu of the straight-line method theretofore used. The effect of this change on net income for 1954 was not material.

Net income includes the earnings of subsidiaries in Canada, Venezuela and Suriname, expressed in thousands in United States currency, as follows: 1958—$7,774; 1957—$6,126; 1956—$5,877; 1955—$4,914; and 1954—$6,995. Translation into United States currency was made at official or current rates of exchange, except that allowances for depreciation and depletion were translated at rates prevailing at the time of acquisition of the related assets, and Canadian dollars were translated at par.

Net sales and operating revenues increased progressively from 1954 to 1957. These changes are attributable to the increased demand for Alcoa's products and expansion of its facilities. A definite increase in demand in relationship to supply occurred in 1955 over 1954. Net sales and operating revenues decreased in 1958 partially as a result of a decline [fol. 4525] in general business conditions and partially as a reflection of an excess of aluminum capacity in the industry in relation to the then current demand. Increases in net income from 1954 through 1956 resulted from the increase in net sales and operating revenues and generally satisfactory profit margins. In spite of an increase in net sales and operating revenues in 1957 a decrease in net income was experienced due principally to a decrease in shipments of fabricated products and lower profit margin. The decrease in 1958 net income is attributed to the lower level of operations as well as to the decrease in profit margin as a result of competitive price cutting which, while evident in 1957, was more fully felt in 1958 as evidenced by the Company's reduction in its price of primary aluminum pig of 2¢ per pound in April, 1958 followed by an increase of only 7/10th of 1¢ per pound in August, 1958.

Proposed Accounting Treatment of Acquisition by Alcoa

The Plan contemplates that either the assets of Rome will be transferred to the Subsidiary in exchange for stock of Alcoa which had theretofore been issued to the Subsidiary or the assets of Rome will be transferred directly to Alcoa for its stock and then such assets will be retransferred by Alcoa to its Subsidiary for the Subsidiary's capital stock.

Alcoa will issue to the Subsidiary, or directly to the Corporation, such number of shares of common stock of Alcoa as shall be required for delivery to the Corporation in payment for the assets of the Corporation. In return, Alcoa will receive all of the shares of capital stock of the Subsidiary which will be recorded as an investment in the accounts of Alcoa at the aggregate market value of such shares of common stock of Alcoa on January 22, 1959, that being the date on which the offer of Alcoa to purchase the assets of the Corporation was accepted by the Corporation's Board of Directors. The aggregate par value of such shares of

common stock of Alcoa will be added to the common stock account of Alcoa and the balance will be recorded as additional capital.

It is expected that the aggregate market value so determined of the shares of common stock of Alcoa which will be issued will exceed the net book value of the assets of the Corporation which are to be acquired by the Subsidiary. In the accounts of the Subsidiary this excess will be allocated to appropriate specific assets and written off over the lives of such assets or will otherwise be amortized in accordance with generally accepted accounting principles.

History and Business of Rome Cable Corporation

Organization

The Corporation was incorporated under the laws of the State of New York on January 20, 1936. It has three plants which are located in Rome, New York, Torrance, California and Collegeville, Pennsylvania. Its executive offices and research center are located in Rome, New York.

Products

The Corporation manufactures in its Rome, New York plant; copper rods and the following wire and cable products for use in the transmission of electrical energy: bare wire, weatherproof wire, magnet wire, building wire, heavy duty flexible cords and cables, mining and welding cables, power and control cables, service drop and service entrance cable, hook-up wire, instrumentation and missile cables as well as many custom built cables for industry and Government.

Copper rolled into copper rod in its own rod mill and drawn into copper wire is the major metal used in the above products. The Corporation also produces copper rods for sale to customers. Like other prime fabricators in the wire and cable industry the Corporation also processes copper wire bars supplied by customers into copper rods and various copper wire and cable products, on a fabricating charge basis. A number of wire products are made from aluminum rods rolled in its own mill.

At its Torrance plant the Corporation manufactures rigid and thin wall steel conduit and mechanical steel tubing. At

its Collegeville plant it manufactures expanded steel cable troughs, cable pulling devices and certain tools and equipment used for the installation and maintenance of underground electrical transmission and distribution power systems.

Marketing

The Corporation markets its products through its own sales offices, salesmen and sales agents. It has 18 sales offices and 10 warehouses throughout the United States. About one-half of the Corporation's products are sold to electrical [fol. 4526] wholesalers who in turn sell to contractors, utilities, industrials, and municipalities. About one-fifth is sold directly to other wire and cable manufacturers, 14% to electrical equipment, electronic and other industrials, and 10% to utjlities. The balance goes to a miscellany of other users, including the Government.

Plants

The Rome plant is located on a 236 acre tract in Rome, New York which the Corporation owns in fee. Buildings cover a total of 894,000 square feet. Buildings are essentially steel, brick and concrete construction, with the exception of the new research center, completed in 1958, which is of steel and glass window-wall construction. The executive offices are located in Rome, N. Y.

The Torrance plant is located on an 11 acre tract in Torrance, California which the Corporation owns in fee. The floor space of the buildings is 146,000 square feet. General construction is of steel, concrete, wood and brick.

The Collegeville plant is located on a two acre tract in Collegeville, Pennsylvania which the Corporation owns in fee. The buildings are of steel, concrete, wood and brick construction, having an area of 45,000 square feet.

Raw Materials

Raw materials used by the Corporation in the manufacture of its products in the order of their importance are: copper, steel, natural and synthetic rubber, polyvinyl and polyethylene plastics, aluminum, zinc and lead, all of which

are purchased from others. The Corporation's purchases of wire bar copper represents approximately 60% of its raw material purchases. Steel for the Torrance plant, purchased in sheet form, represents approximately 15% of the raw material purchases. Aluminum purchased in the form of pig represents approximately 3% of its raw material requirements.

Employee Relations

As of December 31, 1958 the Corporation had 1450 employees, including 933 hourly paid workers. The Corporation has never had a strike or any work stoppage due to labor difficulties in its entire history.

Security Holdings of Directors and Officers

The number of shares of Common Stock of the Corporation beneficially owned, as of February 20, 1959, by the directors and officers of the Corporation and their associates, according to information furnished by such directors and officers, was as follows:

Name	Shares of Rome Cable Corporation Common Stock beneficially owned as of February 20, 1959 By Individual	By Associates
Harry W. Barnard	7,010	265
		7518(1)
		2000(2)
Herbert T. Dyett	50,601	1820(3)
John H. Dyett	31,304	3990(4)
		2425(4)
		6849(4)
		7518(1)
		2000(2)
Charles H. Ellis	3,991	210
Alfred S. Foote	300	
A. D. Ross Fraser	6,000	377
		7518(1)
Glenn Koger	446	
Hal A. Kroeger	2,700	
John L. Loeb	7,737	(5)
Frederick S. Marks	1,042	86
		2000(2)
Glenn E. Rolston	3,167	
Jay T. Sarles	1,886	1492
Rudolph A. Schatzel	3,425	315
[fol. 4527]		
James H. Sharp	100	23
Gerard A. Weiss	359	112
Allan Ziegler	133	

(1) H. W. Barnard, J. H. Dyett and A. D. R. Fraser are officers of Rome Cable Foundation, Inc., holder of 7,518 shares, but in which they have no beneficial interest.

(2) H. W. Barnard, J. H. Dyett and F. S. Marks are officers of Herbert T. Dyett Foundation, Inc., holder of 2,000 shares, but in which they have no beneficial interest.

(3) John H. Dyett is a son of H. T. Dyett.

(4) Certain associates of J. H. Dyett hold 3,990 shares but in which he has no beneficial interest, and there were held in Trust for Julia W. Dyett, wife of J. H. Dyett, 2,425 shares in which J. H. Dyett is a Trustee but in which he has no beneficial interest. J. H. Dyett is Trustee of a trust holding 6,849 shares for Charlotte D. White, his sister, but in which he has no beneficial interest.

(5) On February 20, 1959 certain associates of John L. Loeb were beneficial owners of common stock of the Corporation as follows: Frances L. Loeb, wife of John L. Loeb, 3,465 shares; children of John L. Loeb 6,898 shares; and there were held in trust under Trust indenture 3,636 shares in which John L. Loeb is Trustee for his children, but in which he has no beneficial interest, and 2,756 shares in which Frances L. Loeb is Trustee for their children, but in which she has no beneficial interest. Carl M. Loeb Rhoades & Co. were holders of record but not beneficial owners of 34,079 shares of common stock.

Stock Option Plan

A Stock Option Plan for certain key employees covering 36,000 shares of Common Stock was approved by the share owners on June 20, 1956. On the same date options to purchase 32,800 shares were granted to 31 officers and key employees at $26.85 per share (95% of fair market value). On January 4, 1957 a 5% stock dividend was paid which pursuant to the plan increased the number of shares reserved for issuance to 37,800 and the number of shares subject to option to 34,440 at $25.57 per share. The options were exercisable in cumulative annual installments and enforceable for ten years. As of December 10, 1958, options to purchase 17,535 shares were exercisable but no options had been exercised, and options to purchase additional shares were to become exercisable as follows: 5,250 on June 20, 1959, 4,515 on June 20, 1960, 3,990 on June 20, 1961, 3,150 on June 20, 1962. On December 10, 1958 the Stock Option Committee waived the cumulative provisions of the options and thereupon options at $25.57 per share (aggregating $880,630) for a total of 34,440 shares became exercisable immediately. As of December 10, 1958, the fair market value of Rome Cable Corporation Common Stock was $26.00 per share (aggregating $895,440 on 34,440 shares). Any option may be terminated by the Stock Option Committee upon sixty days notice to the optionee. As of February 20, 1959, no options had been exercised. The Plan provides that shares of stock of the Corporation purchased by the exercise of stock options within three months after the Closing Date are exchangeable for Alcoa common stock on the basis of 6/10 of a share of Alcoa common stock for each share of Rome common stock. The Plan alternatively provides that by mutual agreement of Rome and Alcoa, Alcoa will assume the options outstanding at the Closing Date to the end that there may be purchased thereunder 6/10 of one share of Alcoa common stock at the price of $25.57 for each share of Rome common stock that might have been purchased by exercise of the options on or prior to the Closing Date. In either event, it is intended that all options will be terminated, as is permitted under the terms of the options, within three months after the Closing Date.

History and Business of Aluminum Company of America and Other Data Relating to It

References to the "Company" in the following discussion of the history and business of Alcoa shall be taken to mean Aluminum Company of America.

Organization of Alcoa

The Company was incorporated under the laws of the Commonwealth of Pennsylvania on July 29, 1925, through the merger and consolidation of Aluminum Company of America, a Pennsylvania corporation incorporated on September 18, 1888, and Canadian Manufacturing and Development Company, a Pennsylvania corporation incorporated on May 6, 1925. The principal offices of the Company are located in the Alcoa Building, Mellon Square, Pittsburgh 19, Pennsylvania.

[fol. 4528] Alcoa's Capital Structure

The capitalization of the Company on December 31, 1958, was as follows:

Title of Issue	Originally Authorized	Outstanding
Long-Term Debt(1)		
Sinking Fund Debentures		
3⅛%, due 1964	$125,000,000	$ 52,500,000
3%, due 1979	100,000,000	83,400,000
4¼%, due 1982	125,000,000	119,800,000
3⅞%, due 1983	125,000,000	125,000,000
Notes Payable		
2.55%, due 1967	40,000,000	20,000,000
3%, due 1973	60,000,000	60,000,000
Capital Stock		
Serial Preferred Stock (par value $100 per share)	1,000,000 shs.	
$3.75 Cumulative Preferred Stock	660,000 shs.	659,909 shs.
Common Stock (par value $1 per share)	50,000,000 shs.	20,644,966 shs.(2)

(1) Outstanding long-term debt is exclusive of debt due within one year, and exclusive of miscellaneous long-term debt of the Company and its subsidiaries in an aggregate amount of approximately $2,000,000. See Note 3 to Notes to Consolidated Financial Statements for debt maturities.

(2) If all the shares of Common Stock covered by options under the Employees' Stock Option Plan had been issued and outstanding on December 31, 1958, there would have been 20,981,316 shares of Common Stock outstanding on that date.

Alcoa's Business and Properties

The Company, with its subsidiaries, is an integrated producer and fabricator of aluminum. Its principal operations include mining and processing of bauxite, an aluminum-bearing ore; transportation of bauxite to the United States; production of alumina from bauxite; smelting of aluminum from alumina; making of aluminum alloys; and fabrication of aluminum and aluminum alloys into semi-finished and finished products.

The Company's bauxite is mined principally in Surinam, South America, under concessions which will expire in 2032. The Company estimates its lands held under concessions contain sufficient ore to supply the Company's requirements, at anticipated consumption rates, for the term of the concessions. Surinam bauxite is transported to the United States in ships owned or chartered by subsidiaries of the Company. In connection with the transportation of bauxite, a subsidiary conducts a general shipping business in the Caribbean and to a smaller degree in other areas. Some bauxite is also mined on Company-owned and leased properties in Arkansas. These properties are estimated to contain sufficient bauxite reserves to supply the Company's Arkansas alumina plant, at the 1957-1958 rate of consumption, for at least forty years. Bauxite is being produced from each mining area at a favorable unit cost in relation to prevailing aluminum prices.

A subsidiary of the Company has a concession from the government of the Dominican Republic to explore for and produce bauxite from a number of exploitation parcels. The concession, as amended, covers approximately 22,000 acres and expires in 2007. Bauxite mining and shipping facilities have been provided and ore shipments began in early 1959. The Point Comfort, Texas, alumina plant, which went into partial production early in 1959, is designed to process Dominican-type as well as other types of bauxite.

Bauxite is refined into alumina at Company plants in Mobile, Alabama, Bauxite, Arkansas, and Point Comfort, Texas.

Aluminum is produced from alumina by an electrolytic process requiring large amounts of electric power generated within reasonable proximity of each of the Company's

smelting plants. A substantial portion of such power is generated by the Company or its subsidiaries and the remainder is purchased from others under long-term contracts, supplemented by short-term or spot purchases to meet short-term needs. It is believed that the Company is in a position to generate or purchase sufficient electric power to operate its smelting plants satisfactorily, except for conditions beyond its control, including variations in the availability of water power due to stream flow conditions.

The Company's principal contract to purchase power for its Alcoa, Tennessee, plant expires December 31, 1962; its principal contracts to purchase power for its Wenatchee, Washington, and Vancouver, Washington plants expire in 1971; and its principal contracts to purchase power for its Massena, New York, plant expire in 1997 and 1999, with a substantial curtailment possible under one of the contracts as early as about 1986. The Company has no reason to believe that an extension of the contracts expiring in 1962 and 1971 cannot be negotiated at an appropriate time.

[fol: 4529] In the generation of power by the Company or subsidiaries, any of several sources of energy are used—gas, coal, lignite or water. Where the Company uses gas (Point Comfort), it has reserves either owned or under contract estimated to be sufficient for operation at anticipated maximum consumption rates for approximately seven years. The Company has no reason to believe that it would be unable to procure natural gas at market prices when additional amounts thereof are needed. Where it uses lignite (Rockdale, Texas), it has reserves either owned or under contract estimated to be sufficient for operation at anticipated consumption rates for over fifty years. Where it plans to use coal (Evansville, Indiana), it has acquired reserves estimated to be sufficient for the operation of the plant as presently planned for about sixty years. In its use of water power in connection with the generation of electric power for the Company's Alcoa plant, the Company operates subject to a Federal Power Commission license effective until March 1, 2005. A similar license in connection with use of wate power for the generation of electric power for the Badin, North Carolina, plant is effective until May 1, 2008.

The operation of the Company's hydroelectric facilities

in the Little Tennessee Valley is integrated with the operations of the Tennessee Valley Authority (T. V. A.) pursuant to the terms of an agreement effective until December 31, 1962, and thereafter from year to year until terminated by three years' prior notice.

Fluorspar for the production of chemicals used in the smelting of aluminum or for sale to others is mined in Hardin County, Illinois, where the Company operates a crushing and beneficiation mill. The Company has mining rights in Illinois, Kentucky, Colorado and Idaho covering properties estimated to contain sufficient ore to supply the fluoride requirements of the Company and its subsidiaries, on the basis of their 1957-1958 use in the smelting of aluminum, for approximately twenty years.

During 1958, the Company's production of primary aluminum amounted to about one-third of the total produced in the United States. The Company's total production of primary aluminum, measured in short tons, for each of the years 1954 through 1958 was as follows: 1954—666,000; 1955—702,000; 1956—756,000; 1957—712,000; and 1958—529,000. Contractual and spot purchases of aluminum for the same years, measured in short tons, were: 1954—92,300; 1955—78,700; 1956—111,900; 1957—82,400; and 1958—79,200. Current schedules call for production in 1959 of about 568,000 short tons. It is estimated that purchases of aluminum in 1959 will amount to about 51,000 short tons, which includes 49,000 short tons to be procured under existing purchase agreements.

Primary aluminum is fabricated, cast or otherwise processed at seventeen plants of the Company located in twelve states. These plants are generally located near the various market areas for the products produced by the Company. Information with respect to each of these fabricating plants is shown in the following tabulation:

Location	Principal Products	Floor Space (Sq. ft.) (Approximate)
Alcoa, Tennessee		
North Plant	Sheet and plate	2,460,000
West Plant	Sheet and plate, foil, powder and paste, and welded tube	1,625,000
Bridgeport, Connecticut	Castings (sand, plaster process and permanent mold)	400,000
Chillicothe, Ohio	Cooking utensils	130,000
Cleveland, Ohio	Castings (sand, plaster process and permanent mold), hammer and press forgings and magnesium castings (permanent mold) and forgings	1,812,000
Cressona, Pennsylvania	Extrusions (including impact extrusions)	1,500,000
Davenport, Iowa	Sheet, plate and foil	3,200,000
Detroit, Michigan	Castings (sand, plaster process and permanent mold)	369,000
Edgewater, New Jersey	Sheet, foil and impact extrusions	1,083,000
Garwood, New Jersey	Die Castings (including magnesium)	163,000
Hillside, Illinois	Die castings	243,000
Lafayette, Indiana	Tube and extrusions	1,879,000
Lancaster, Pennsylvania	Rivets and fasteners, screw machine products and nails	250,000
Massena, New York	Wire, rod, bar and structural shapes, bare wire and cable, covered wire and cable, and cable accessories	2,520,000
New Kensington, Pa.	Tube, extrusions, foil, powder, paste, cooking utensils, jobbing products, magnesium extrusions and other products	2,260,000
Richmond, Indiana	Bottle and jar closures, and collapsible tubes	270,000
Vancouver, Washington	Rod, wire, extrusions, bare wire and cable and cable accessories	445,000
Vernon, California	Castings (sand, plaster process and permanent mold) and forgings (including magnesium), rivets, extrusions and tube	1,222,000

[fol. 4530] Principal products manufactured and marketed by the Company include, in addition to primary aluminum, sheet and plate, extruded products, castings, wire, rod and bar, forgings, electrical conductors and accessories, foil, tubing, certain chemical products, rivets and screw machine products, impact extrusion products, jobbing products, closures, and powder and paste. The Company produces and markets "Alcoa Wrap" household foil and "Wear-Ever" cooking utensils.

Net sales and operating revenues from 1954 through 1958, in thousands of dollars, were as follows:

Years	Primary Aluminum (Pig and Ingot)		Fabricated Products	Other Sales and Misc. Revenues(1)	Operating Revenues(2)	Total Net Sales and Operating Revenues(3)
	Tons	Amounts				
1954	317,766	$132,726	$493,619	$43,375	$38,624	$708,344
1955	238,448	112,694	647,327	39,671	45,336	845,028
1956	204,149	107,732	667,822	43,421	45,441	864,416
1957	246,885	132,975	639,385	46,722	50,296	869,378
1958	211,436	109,955	561,788	31,744	49,653	753,140

(1) Includes bauxite, alumina in various forms, and other products.
(2) Includes revenues from shipping and other operations.
(3) The figures in this column include the following approximate percentages of total net sales to, and operating revenues from, the U. S. Government: 1954—16%; 1955—6%; 1956—1%. 1957—7%; 1958—7%.

During 1958, Alcoa completed shipments of primary aluminum to General Services Administration under contracts entered into in 1950-1951 in connection with expansions of Alcoa's smelting facilities. Such shipments for 1958 were about 7% below those of 1957.

Alcoa reduced its price of primary aluminum pig by 2¢ per pound to 24¢ per pound on April 1, 1958, following world market aluminum price reductions. Alcoa increased its price of primary aluminum pig by 7/10 of 1¢ per pound to 24.7¢ per pound on August 1, 1958. At the times of both primary aluminum price changes, appropriate adjustments were made in the published prices of other products sold by Alcoa.

In order to improve its position in the highly competitive markets in which its products are sold, the Company, many years ago, initiated an intensive and coordinated research and development program. It is the policy of the Company to pursue this program vigorously to stimulate the development of new and improved products of aluminum and new and expanding markets for aluminum.

Alcoa's Property Additions and Retirements

Property expenditures, retirements and net additions to the plant accounts for the years 1954 through 1958 are shown in the following table:

Years	Expenditures	Retirements	Net Additions
1954	$ 67,151,000	$12,061,000	$ 55,090,000
1955	79,521,000	17,113,000	62,408,000
1956	139,311,000	17,834,000	121,477,000
1957	207,500,000	18,106,000	189,394,000
1958	81,600,000	21,051,000	60,549,000
Total	$575,083,000	$86,165,000	$488,918,000

Important facilities added or expanded during this period include smelting plants at Wenatchee and Rockdale, alumina and alumina chemicals plants at Bauxite, addition of one potline to the five existing potlines at the Point Comfort smelting plant, a plant at Lancaster for the production of aluminum fasteners and screw machine products, a new foil mill at Davenport, and various additions to fabricating facilities, particularly at the Davenport and Alcoa plants. In addition to major plant expansions, additional equipment and miscellaneous additional facilities were added. These

included ore-carrying ships and hydroelectric developments, including a new dam and generating station at Chilhowee, Tennessee.

[fol. 4531] In 1956, the Company started construction of a smelting plant and steam-electric generating facilities near Evansville, Indiana, designed to produce approximately 150,000 tons of aluminum per year. Acquisition of the necessary coal reserves for fuel is now substantially completed. The steam-electric generating station and the first of five planned units of the smelting plant will be essentially completed in 1959. The Company has not decided when to complete the remainder of the work.

In 1956, construction of an alumina plant on the Texas coast near the Point Comfort smelter was started. One of the four units of this plant was completed early in 1959 and it is expected that a second unit will be completed in 1960. The Company has not decided when to complete the remainder of the work. Additional smelting facilities at Massena and at Point Comfort were started in 1956 and were completed in 1958, with the exception of one potline at Massena.

The Company and the Government of Suriname have entered into an agreement under which the Company will construct in that country an aluminum smelting plant and hydroelectric facilities to furnish necessary electrical energy. The smelting plant would be designed to produce approximately 60,000 tons of aluminum annually. The agreement also provides that at a later date the Company will construct an alumina refining plant to process local bauxite. Concessions for mining and exploration for bauxite have also been extended and enlarged under the agreement. It is presently estimated that the total investment in the project will eventually be approximately $150,000,000.

The Company presently estimates that the outlay for additional facilities for 1959 will be approximately $65,000,000. It is expected that cash on hand and to be generated in the normal course of business will be sufficient to finance these facilities.

Description of Alcoa's Capital Stock

By Article Fifth of the Articles of Incorporation, as amended, of the Company, it is authorized to issue 1,000,000 shares of Serial Preferred Stock of the par value of $100 per share and 50,000,000 shares of Common Stock of the par value of $1 per share.

Pursuant to said Article Fifth, the Serial Preferred Stock may be issued in one or more series and the Board of Directors is authorized to divide shares of Serial Preferred Stock into series and to determine the number of shares of any series, and, subject to the provisions of said Article, to determine the rate of dividend (including the date from which dividends shall be cumulative), the price at, and the terms and conditions on, which shares may be redeemed, the amounts payable on shares in the event of voluntary or involuntary liquidation and sinking fund and conversion provisions, if any.

The Board of Directors has by resolution established a series of Serial Preferred Stock designated "$3.75 Cumulative Preferred Stock" and consisting initially of 660,000 shares.

The complete terms and provisions relating to the capital stock of the Company are contained in said Article Fifth of the Articles of Incorporation, as amended, and the said resolution of the Board of Directors, copies of which are filed with the Securities and Exchange Commission, to which copies reference is made, and the summaries herein relating to such stock are qualified in their entirety by such reference.

(a) *Dividend rights.* The holders of Common Stock are entitled to receive dividends, when and as declared by the Board of Directors, but no dividend shall be declared or paid on the Common Stock unless all quarterly dividends accrued on the Serial Preferred Stock and the dividend thereon for the current quarter shall have been paid or declared and set apart.

(b) *Voting rights.* Holders of Common Stock are entitled to one vote per share and to cumulative voting rights in the election of directors.

The holders of Serial Preferred Stock have no voting rights except as otherwise provided by law and except that:

(i) If at any time the amount of any dividends on Serial Preferred Stock which have accrued and which have not been paid or declared and set apart shall be at least equal to the amount of four quarter-yearly dividends, the holders of Serial Preferred Stock shall have one vote per share, provided, however, that such voting rights of the holders of Serial Preferred Stock shall continue only until all quarter-yearly dividends accrued on the Serial Preferred Stock have been paid or declared and set apart.

[fol. 4532] (ii) Without the consent of the holders of at least a majority in some cases, and two-thirds in other cases, of the shares of Serial Preferred Stock at the time outstanding, the Company may not take certain designated actions, particularly action relating to or affecting such Serial Preferred Stock, or any class of stock ranking on a parity with or senior to it as to dividends or assets, or involving merger or consolidation with certain designated results as to any class of stock ranking senior to or on a parity with the Serial Preferred Stock, or involving the disposition of all or substantially all of the Company's property or business or the voluntary liquidation, dissolution or winding up of its affairs.

(c) *Liquidation rights.* Upon any liquidation, dissolution or winding up of the Company, whether voluntary or involuntary, after payments to holders of Serial Preferred Stock of such amount as shall have been fixed by the Board of Directors, plus accrued dividends, the remaining assets of the Company shall belong to and be divided among the holders of Common Stock. The consolidation or merger of the Company with or into any other corporation or corporations in pursuance of applicable statutes providing therefor shall not be deemed to be a liquidation, dissolution or winding up of the Company.

Upon any voluntary or involuntary liquidation, dissolution or winding up of the Company, the holders of $3.75 Cumulative Preferred Stock shall be entitled to $100 per share, plus accrued dividends.

(d) *Preemptive or other subscription rights.* The holders of Common Stock have no right to participate in any right

of subscription to any increased or additional capital stock of the Company.

(e) *Liability to assessment by the Company.* The Common Stock is non-assessable.

Transfer Agents for the Common Stock are Mellon National Bank and Trust Company, Pittsburgh, and Bankers Trust Company, New York. Registrars are Fidelity Trust Company, Pittsburgh, and Guaranty Trust Company, New York. The Common Stock of the Company is listed on the New York Stock Exchange.

Information Concerning Alcoa's Directors and Officers

The directors and officers of the Company, and their positions and offices, are as follows:

Name of Director or Officer	Positions and Offices Held
M. M. Anderson	Director and Vice President
R. V. Davies	Director and Vice President
Leon E. Hickman	Director, Vice President and General Counsel, Member of the Executive Committee
Alfred M. Hunt	Director and Secretary
Roy A. Hunt	Director and Chairman of the Executive Committee
Frank L. Magee	Director and President, Member of the Executive Committee
Richard K. Mellon	Director, Member of the Executive Committee
George J. Stanley	Director
I. W. Wilson	Director and Chairman of the Board, Member of the Executive Committee
George W. Wyckoff	Director
N. R. Althauser	Vice President and Controller

Name of Director or Officer	Positions and Offices Held
F. J. Close	Vice President
H. C. Erskine	Vice President
Lewis P. Favorite	Vice President
B. J. Fletcher	Vice President
J. P. Haight	Vice President
Arthur P. Hall	Vice President
R. O. Keefer	Vice President
Lawrence Litchfield, Jr.	Vice President
Robert B. McKee	Vice President
Edward B. Wilber	Vice President and Treasurer
R. E. Coulter	Assistant Treasurer
C. W. Head	Assistant Treasurer
Matt. W. Stanley	Assistant Treasurer
S. T. Gustina	Assistant Controller
C. C. Conner	Assistant Secretary
Harry Flynn	Assistant General Counsel
William K. Unverzagt	Assistant General Counsel

Each of the officers has been in the employ of the Company for more than five years. From March 1, 1951 until April 30, 1954, Mr. Wilber was President of American Lumber & Treating Co., in which the Company had an interest. Prior to that time he was employed by the Company for many years.

[fol. 4533] Direct Remuneration and Retirement Plan Data—Alcoa's Directors and Officers

The direct remuneration for 1958 of each of the three highest paid officers and of each director whose aggregate remuneration accrued by the Company during 1958 exceeded $30,000, and for all directors and officers as a group, together with their estimated retirement benefits, are as follows:

Name of Individual or Identity of Group	Capacities in Which Remuneration Was Received	Aggregate Remuneration (1)	Estimated Annual Retirement Benefits (2)
M. M. Anderson	Vice President	$ 112,000	$ 30,528
R. V. Davies	Vice President	107,000	24,491
Leon E. Hickman	Vice President and General Counsel	125,000	24,948
Alfred M. Hunt	Secretary	31,000	13,250
Roy A. Hunt	Chairman of the Executive Committee	90,000	47,250
Frank L. Magee	President	161,000	32,320
I. W. Wilson	Chairman of the Board	190,000	55,377
Directors and Officers as a Group	Officers	1,768,159	506,023

(1) During 1958, the Company had agreements with eighteen officers and, as of December 31, 1958, with sixteen officers providing for the payment to them, or in case of death to designated persons, in equal monthly installments during varying periods of five, eight and ten years after the termination of their employment by death, disability or retirement at or after age 65, of an amount equal to the aggregate additional compensation paid by the Company to them, respectively, after the dates of their agreements. The officers have agreed during such periods to perform such advisory or consulting services as the Company may request and to refrain from entering the employ of, or rendering any service to, any competitor of the Company or any of its wholly owned subsidiaries. Those employees who shall receive additional compensation and the individual amounts thereof are determined each year by the Executive Committee of the Board of Directors (no member thereof participating in a decision on his own compensation), the total amount being within the limits of the lump sum appropriation by the Board of Directors for additional compensation. Aggregate remuneration as above stated includes additional compensation accrued for services rendered in 1958 although such additional compensation was not payable until January 1959. Amounts equal to the additional compensation were accrued by the Company in 1958 for the accounts of the eighteen officers under the deferred compensation agreements as follows: Mr. Anderson—$28,000, Mr. Davies—$26,000, Mr. Hickman—$29,000, Mr. Magee—$35,000, Mr. Wilson—$40,000, and other officers—$221,200. The aggregate amounts accrued to date for the accounts of the eighteen officers under the deferred compensation agreements are: Mr. Anderson—$210,500, Mr. Davies— $196,000, Mr. Hickman—$224,000, Mr. Magee—$247,500, Mr. Wilson—$315,000, and other officers—$878,500.

(2) Except as noted below, the estimated annual retirement benefits to directors and officers are based on the assumptions that the Retirement Plan shall continue in effect unchanged until the normal retirement date of the individual, that he shall continue to work for the Company at his present rate of compensation until retirement, that he shall retire on his normal retirement date, and that he shall not have elected any optional form of annuity. The estimated annual retirement benefits of Mr. Roy A. Hunt and Mr. Wilson and two other officers represent the normal annual pensions which would have been payable to them if they had retired on December 31, 1958. The estimated annual retirement benefits of one director who retired from active service as an officer prior to 1958 and of two officers who retired from active service in 1958 represent the actual pensions payable to them.

No specific amount is paid or set aside by the Company for the account of any individual officer or employee under its Employee Retirement or Group Insurance Plans. Contributions and premiums, respectively, are paid by the Company on a group basis and not on an individual basis.

Alcoa Savings Plan Data

At the 1958 annual meeting of the shareholders, approval was giving to the Alcoa Savings Plan For Salaried Employees under which an eligible employee may save from 2 to 8% of his salary (depending on length of service). The Company makes a contribution equal to one-half of the employee's savings. The employee's savings and the Company contribution are turned over to a Trustee for investment. The employee may direct that all of his savings be invested in U. S. Savings Bonds, or one-half be invested in Savings Bonds and the other one-half in common stock of the Company. The Company contribution is invested in common stock of the Company. While the employee may withdraw either one-half or all of his own savings for any year at any time, the Company contribution for any one year for the employee will be forfeited unless he leaves his savings for that year with the Trustee until the end of the third year following that year. The Trustee may purchase the common stock either on the open market or from the Company at the current market price. The Trustee is to vote all non-forfeitable full shares of common stock of Alcoa [fol. 4534] held by it in a participant's account in accordance with the participant's directions and may in its discretion vote all other shares held by it.

The savings of each person named in the foregoing table of remuneration and of all directors and officers as a group, and the Company contributions made with respect to them during the year 1958 under the Savings Plan (including amounts saved during the preliminary program which began November 1, 1957, and ended during 1958 and the Company contributions with respect to the preliminary program of one-half the savings plus an amount calculated at the rate of 3% per year on the total of such savings and contributions) were as follows:

Name of Individual or Identity of Group	Savings	Company Contributions
M. M. Anderson	$ 7,840	$ 3,952
R. V. Davies	4,860	2,430
Leon E. Hickman	5,880	2,964
Alfred M. Hunt	2,240	1,120
Roy A. Hunt	8,400	4,234
Frank L. Magee	11,200	5,645
I. W. Wilson	14,000	7,056
Directors and Officers as a Group	104,021	52,399

The Company contribution for the account of all directors and officers as a group represents less than 2% of the gross Company contribution to the accounts of all employees participating in the Savings Plan.

Alcoa Employees' Stock Option Plan Data

An employees' stock option plan was adopted by the Company's shareholders in 1952. Among the purposes of the plan is the encouragement of officers and employees mainly responsible for the management, growth and protection of the business of the Company to purchase its common stock and thus to share more directly in the future success of the business. Other considerations include an incentive to the key employees to promote the well-being of the Company and to develop a better appreciation by these employees of the shareholder point of view in matters of corporate management.

Options under the plan have been granted as set forth in the table below. Data as to number of shares and price have been adjusted to reflect the 2 for 1 stock splits in April 1953 and June 1955.

Date Options Granted	Total Number of Shares Covered	Option Price
May 15, 1952	1,057,600	$ 17.68¾
February 26, 1954	174,700	29.37½
July 24, 1956	198,100	117.25
March 7, 1958	193,000	68.50

The 1958 options were issued at 100% of the market price on the date of issuance and the other options were issued at approximately, but not less than, 95% of such market price.

At the time the options were issued in 1958, the Company and optionees cancelled options for a like number of shares granted on July 24, 1956. It was felt that by virtue of the general business recession and the decline in the market

price of the Company's stock the options issued in 1956 were no longer effective in promoting the purposes of the plan.

Directors and officers whose remuneration is reported in the foregoing table of remuneration received options on March 7, 1958, as follows: Mr. Anderson—2,000 shares, Mr. Davies—1,000 shares, Mr. Hickman—2,500 shares, Mr. Alfred M. Hunt—1,000 shares, and Mr. Magee—5,000 shares. Total options granted to all directors and officers as a group on that date amounted to 27,000 shares. These directors and officers surrendered options for a like number of shares that originally had been issued on July 24, 1956. [fol. 4535] As of February 6, 1959, there have been exercised in whole or in part 1,105 options for the purchase of 1,093,410 shares, for which the Company has received $20,716,391. Mr. Alfred M. Hunt exercised options on April 29, 1958, as follows: options issued May 15, 1952, for 600 shares; options issued February 26, 1954, for 1,200 shares. The high and low sales prices of the Company's common stock on the New York Stock Exchange on that date were $65.50 and $64.87½, respectively. Directors and officers as a group have exercised options for the purchase of the number of shares shown in the following tabulation which also shows the range of market prices:

Calendar Period	May 1952 Options Number of Shares Purchased at $17.68¾ Per Share	Feb. 1954 Options Number of Shares Purchased at $29.37½ Per Share	Market Price Range
First Quarter 1958	0	300	$74½-60⅜
Second Quarter 1958	600	1,200	$71⅜-62½
Third Quarter 1958	0	4,000	$90 -69¼
Fourth Quarter 1958	0	0	$96½-82⅝
Jan. 1–Feb. 6, 1959	0	0	$83⅞-80

In consideration for each option granted to him, the optionee under each of the foregoing series of options agreed to remain in the employment of the Company or its subsidiaries for at least two years after the date of the option or until age 65, whichever should be earlier, at the salary rate in effect on said date or such changed rate as might be fixed by the Company or its subsidiaries, except that an optionee who had attained age 65 when granted an option agreed so to remain in employment for the period of his extended service at that time. Subject to the provisions of the plan, options granted in 1952, 1954 and 1956 to persons under age 65 may be exercised during 10 years after the date thereof (but only after two years from such date in the case of 1956 options), but if on the 6th, 7th, 8th or 9th anniversary of the issuance of any option the unexercised portion thereof shall exceed 90%, 80%, 70% or 60%, respectively, of the shares originally covered thereby (as adjusted for stock dividends, stock split-ups and certain other changes in capital structure), the options shall thereupon expire as to such excess. Subject to the provisions of the plan, options granted in 1958 to persons under age 65 are exercisable after July 24, 1958, and within eight years from said date, but if on the 4th, 5th, 6th or 7th anniversary of said date the unexercised portion thereof shall exceed 90%, 80%, 70% or 60%, respectively, of the shares covered thereby (as adjusted for stock dividends, stock split-ups and certain other changes in capital structure), the options shall expire as to such excess. The option granted to one who had attained age 65 is exercisable only within one year from the date thereof. The plan provides that upon an optionee's death, the termination of his employment or his attaining age 65, his option may thereafter be exercised only within limited times and in each case prior to the expiration of the option period.

Alcoa's Stock Ownership

As of February 6, 1959, there were approximately 3,900 shareholders of the Company's $3.75 Cumulative Preferred Stock and approximately 23,800 shareholders of its Common Stock.

The only shareholder who held of record 10% or more of any class of stock of the Company on February 6, 1959 was Mac & Company, P. O. Box 926, Pittsburgh, Pennsylvania, which held 126,413 shares of $3.75 Cumulative Preferred Stock (19.2% of the class) and 1,666,485 shares of Common Stock (8.1% of the class). The Company has been informed by Mellon National Bank and Trust Company that Mac & Company is a nominee of the Bank for the purpose of holding record title to securities and that the shares of Preferred and Common Stock of the Company of record in the name of Mac & Company on February 6, 1959, were held by the Bank in various fiduciary capacities, of which 73,653 shares of Preferred Stock and 40,000 shares of Common Stock were held by the Bank as Trustee under the Employee Retirement Plans of the Company and participating subsidiaries.

The directors and officers of the Company, as a group, owned 2,618,516 shares of Common Stock (12.7% of the class) on February 6, 1959, according to information furnished to the Company by them. Two officers owned .60 shares of Preferred Stock, and a director and officer had a remainder interest in two trusts in which 1,090 shares of Preferred Stock were held.

[fol. 4536] Dissenters' Rights of Appraisal

Under the laws of the State of New York (see Sections 20 and 21 of the New York State Stock Corporation Law) any stockholder not in favor of the Plan outlined above may at any time prior to the vote upon such Plan object to such Plan, in writing filed with the Corporation, and demand payment for his stock. Under the provisions of Sections 20 and 21 of the New York State Stock Corporation Law the Corporation, within ten days after the last day on which a demand for such payment might have been made, would be required to offer to buy the stock from the dissenting stockholder at a price deemed by the Corporation to be the value thereof. If the Corporation fails to make such offer or the stockholder does not accept the Corporation's offer within 20 days, either he or the Corporation may petition the New York State Supreme Court to determine the value of such

stock as of the day before the vote on the proposal to which the stockholder objects, and the Court will thereafter proceed with such a determination. Any stockholder demanding payment for his stock unless he has accepted an Offer of the Corporation to pay for his stock, must within 20 days after the vote upon the Plan, submit his stock certificate or certificates to the Corporation for notation thereon of the fact of such demand.

The above summary of the laws of the State of New York with respect to the rights and remedies of dissenting stockholders does not purport to be complete and is qualified in its entirety by reference to Sections 20 and 21 of the New York State Stock Corporation Law, copies of which Sections are annexed hereto as Exhibit B.

Financial Statements

This Proxy Statement includes the financial statements referred to on page 22.

Other Matters

The management does not know of any other matters which may come before the meeting. However, if any other matters properly come before the meeting, it is the intention of the appointees named in the enclosed form of Proxy to vote the Proxy in accordance with their judgment on such matters.

Solicitation of Proxies

The Corporation will pay the cost of preparing and mailing this proxy statement and the cost of soliciting proxies. In addition to the solicitation of share owners of record by mail, the Corporation will request brokerage houses and other nominees or fiduciaries to forward soliciting material to beneficial owners of stock held of record by such persons, and the Corporation will reimburse such brokerage firms and other nominees and fiduciaries for their expenses incurred in forwarding such soliciting material to the beneficial owners of shares held by them of record. It is also expected that some of the officers, directors and regular employees of Rome Cable Corporation, who will receive no compensa-

tion therefor in addition to their regular compensation, will solicit proxies on behalf of the management by telephone, telegraph and personal interview, the cost of any such solicitation to be borne by Rome Cable Corporation.

The Board of Directors of Rome Cable Corporation Strongly Recommends a Vote in Favor of the Proposed Plan.—Your Cooperation in Giving This Matter Your Immediate Attention and in Returning Your Proxies Promptly Will Be Appreciated.

By order of the Board of Directors, Gerard A. Weiss, Secretary.

Rome, New York

March 3, 1959.

[fol. 4538] Opinion of Independent Public Accountants

Board of Directors
Rome Cable Corporation
Rome, New York

We have examined the financial statements of Rome Cable Corporation for the period of five years ended March 31, 1958. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the accompanying statement of financial condition, operating statements and analyses of capital invested present fairly the financial position of Rome Cable Corporation at March 31, 1958, and the results of its operations for the period of three years then ended, in conformity with generally accepted accounting principles applied on a consistent basis.

Further, it is our opinion that the tabulation appearing in the Proxy Statement under the caption "Summary of Earnings" presents fairly in summarized form, and in accordance with generally accepted accounting principles consistently applied, the information therein set forth for the period of five years ended March 31, 1958.

Ernst & Ernst.

New York, New York

February 9, 1959.

[fol. 4543] Rome Cable Corporation

Notes to Financial Statements

Note A—Inventories:

Inventories are stated generally at cost, and include amounts of $6,959,130 and $6,321,765 at December 31, and March 31, 1958 respectively, which were computed by the last-in, first-out method. Total inventory valuation is well below aggregate market prices.

	December 31, 1958	March 31, 1958
Inventories consisted of:		
In process and finished goods	$5,852,160	$5,397,623
Raw materials	1,354,800	1,180,147
Spools, reels, cases, manufacturing supplies	417,923	336,882
	$7,624,823	$6,914,652

Amounts of inventories used in computation of cost of products sold, priced on the aforesaid basis, were as follows:

April 1, 1955	$6,024,630
March 31, 1956	6,979,752
March 31, 1957	7,245,818
March 31, 1958	6,914,652
December 31, 1958	7,624,823

Note B—Receivables From Employees:

Receivables from employees under stock purchase plan include $46,284 at December 31, 1958 and $52,702 at March 31, 1958 due from officers.

Note C—Long-term Debt:

The promissory notes (4¾%) provide for additional payments, due each August 1st, limited to $100,000 for each year, contingent on earnings of the preceding fiscal year, to be applied to the latest maturities of the notes.

So long as the notes are outstanding, the Company is required, among other things, to maintain net working capital (excess of current assets over current liabilities) at stipulated amounts. At December 31 and March 31, 1958, net

working capital exceeded such requirements by more than $4,400,000.

The terms of issuance of the notes place certain restrictions upon the payment of dividends (except stock dividends) and the redemption, retirement, or purchase by the Company of its capital shares. The portion of earnings retained in the business not affected by these restrictions was approximately $2,052,000 at December 31, 1958, and $2,293,000 at March 31, 1958.

Note D—Stock Option Plan:

Reference is made to the caption "Stock Option Plan" in this Proxy Statement concerning stock options.

Note E—Renegotiation:

Renegotiation proceedings for years up to the fiscal year ended March 31, 1956 have been concluded. Settlement for year ended March 31, 1954 resulted in a decrease of $87,390 in net earnings for that year and retro-active adjustment therefor has been made in the financial statements. It is believed that any renegotiation refunds which might be required for subsequent years would not materially affect the financial position of the Company at December 31, 1958, or earnings for the two years and nine months then ended.

Note F—Pension Plans:

There is in effect a non-contributory pension plan covering all employees and also a group retirement insurance plan covering all salaried employees, which is partly contributory by the beneficiaries. The unfunded past service cost of the pension plan was approximately $2,215,000 and $2,160,000 at December 31, 1958 and March 31, 1958, respectively. The Company reduced its contribution for past service cost for the year ended March 31, 1958, and made no provision for past service cost for the nine months ended December 31, 1958. Amounts provided under the plans were as follows:

Period	Amount Provided
Year ended March 31, 1956	$580,882
Year ended March 31, 1957	594,293
Year ended March 31, 1958	493,384
Nine months ended December 31, 1958	278,000

[fol. 4544] Note G—Depreciation and Amortization Policies, etc.:

Depreciation is computed on the sum of the years digits method for certain assets acquired new; subsequent to December 31, 1953. All other assets are depreciated by the straight line method.

Other than costs referred to hereinafter, which had been certified for amortization over five year periods, depreciation has been computed on the basis of the estimated useful life of such assets as follows:

Buildings	5 to 40 years
Machinery and equipment	3 to 18 years
Transportation equipment	5 to 10 years
Office furniture and equipment	2 to 18 years
Fences	15 years

Cost of facilities aggregating $805,837 which had been certified for amortization over periods of five years had been fully amortized at March 31, 1958.

Expenditures for maintenance and repairs were charged to current operating expenses. Cost of renewals and betterments were charged to the pertinent property accounts. At the time properties were replaced, retired or otherwise disposed of, the cost of such properties and the amount of depreciation accumulated thereagainst were deducted respectively from the pertinent asset and related depreciation allowance accounts. Profit or loss resulting from such transaction was included in the income account for the year.

Note H—Supplementary Profit and Loss Information:

	Nine months ended December 31, 1958	Year ended March 31, 1958	1957	1956
Charged directly to profit and loss				
Maintenance and repairs				
Charged to costs	$458,392	$753,126	$930,751	$789,708
Charged to other expenses	2,842	5,092	2,742	3,028
	$461,234	$758,218	$933,493	$792,736
Provision for depreciation and amortization of plants and equipment				
Charged to costs	$680,953	$835,691	$810,163	$830,030
Charged to other expenses	18,032	22,502	16,151	13,526
	$698,985	$858,193	$826,314	$843,556
Taxes, other than taxes on income				
Charged to costs				
On pay rolls	$120,134	$173,550	$181,037	$164,685
Realty and personal property	189,425	239,790	223,273	195,871
Charged to other expenses				
On pay rolls	19,037	30,623	28,149	50,933
Realty and personal property	33,199	31,513	24,353	28,172
Franchise, etc.	20,000	120,092	234,967	213,384
Total taxes	$381,795	$595,568	$691,779	$653,045
Rents and royalties				
Charged to costs	$ 47,011	$ 60,242	$ 74,015	$ 51,326
Charged to other expenses	46,295	76,258	70,101	81,329
	$ 93,306	$136,500	$144,116	$132,655

There were no management or service contract fees.

[fol. 4545] Note I—Proposed Sale of Assets:

Reference is made to the caption "The Proposed Plan and Agreement" in this Proxy Statement for the terms of the proposed Plan and Agreement dated February 17, 1959, between Aluminum Company of America and Rome Cable Corporation.

Note J—Operations for the Nine Months Ended December 31, 1958:

The Company is of the opinion that all adjustments necessary for a fair statement of operating results for this nine months have been included and consisted solely of normal recurring accruals. Interim figures for the nine months are not necessarily indicative of the results for the entire year.

[fol. 4546] Opinion of Independent Certified Public Accountants

To the Shareholders and Board of Directors of Aluminum Company of America:

We have examined the consolidated balance sheet of Aluminum Company of America and consolidated subsidiary companies as of December 31, 1958, and the related summary of consolidated income for the years 1954 through 1958, and statements of consolidated retained earnings and additional capital for the years 1956 through 1958. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the aforementioned financial statements present fairly the consolidated financial position of Aluminum Company of America and consolidated subsidiary companies at December 31, 1958, and the results of their operations for the years 1954 through 1958, in conformity with generally accepted accounting principles, and such principles were applied on a consistent basis except for the change in 1956 with respect to the method of valuing inventories and

the change in 1954 with respect to the method of computing depreciation referred to in Note B of Notes to Summary of Consolidated Income, in which we concur.

Lybrand, Ross Bros. & Montgomery.

Pittsburgh, Pa.
February 3, 1959.

[fol. 4550] Aluminum Company of America
and Consolidated Subsidiary Companies

Notes to Consolidated Financial Statements

Note Relating to Principles of Consolidation and Equity in Consolidated Subsidiaries:

The consolidated financial statements include all companies which are wholly owned. At December 31, 1958, the excess of the Company's equity in net assets of consolidated subsidiaries, as shown by their accounts, over its investment therein was $68,771,058. In consolidation, undistributed earnings of consolidated subsidiaries since acquisition, amounting to $68,878,351, have been included in consolidated retained earnings and $107,293, representing the excess of cost of investment in one subsidiary over its net assets at date of acquisition, has been included with the book value of land owned by the subsidiary. All intercompany and interdepartmental transactions and profits, material in amount, have been eliminated.

The consolidated balance sheet includes net assets of consolidated subsidiaries in Canada, Venezuela and Surinam, amounting (in United States currency) to $19,104,167. In consolidation, property assets and allowances for depreciation and depletion have been translated into United States currency at the approximate exchange rates in effect at the time such assets were acquired, and other assets and liabilities have been translated at the official or current rates of exchange, except that Canadian dollars have been translated at par.

Note 1. Inventories and Cost of Goods Sold:

Inventories are carried at the lower of cost or market. At December 31, 1956, 1957 and 1958, such costs were determined for substantially all inventories under the last-in first-out method. Prior thereto, the average cost method was used.

At December 31, 1958, inventories are classified, as follows:

Finished goods	$ 52,714,027
Work in process	112,945,245
Bauxite and alumina	17,840,222
Purchased raw materials	15,107,509
Operating supplies	11,258,779
	$209,865,782

The amounts of inventories used in the computation of cost of goods sold, priced as explained above, were as follows: December 31: 1958—$209,865,782; 1957—$231,726,354; 1956—$224,853,985; 1955—$162,259,709; 1954—$162,967,621; and 1953—$167,137,685.

Note 2. Unamortized Debt Discount and Expense:

Deferred debt discount and expense is being amortized over periods from dates of issue of long-term debt to dates of required prepayment or dates of maturity.

Note 3. Debt:

At December 31, 1958, long-term debt comprised:

Sinking Fund Debentures:	
3⅛%, due February 1, 1964	$ 52,500,000
3%, due June 1, 1979	83,400,000
4¼%, due January 1, 1982	125,000,000
3⅞%, due April 1, 1983	125,000,000
Notes payable:	
2.55%, due January 1, 1967	20,000,000
3%, due December 1, 1973	60,000,000
Other	2,583,669
Total long-term debt	468,483,669
Less, amount due within one year included in current liabilities	5,786,189
	$462,697,480

[fol. 4551] The indenture under which the 3⅛% Sinking Fund Debentures, due February 1, 1964, were issued provides for sinking fund payments sufficient to retire $10,000,000 in each of the years 1959 through 1963. Retirements were made in 1958 on these debentures covering the 1959 requirement of $10,000,000. The indenture under which the 3% Sinking Fund Debentures, due June 1, 1979, were issued provides for sinking fund payments sufficient to retire $4,-

150,000 of debentures in each of the years 1959 through 1978. Retirements were made in 1958 and 1957 on these debentures covering the 1959 requirement of $4,150,000. The indenture under which the 4¼% Sinking Fund Debentures, due January 1, 1982, were issued provides for sinking fund payments sufficient to retire $5,200,000 of debentures in each of the years 1959 through 1981. The indenture under which the 3⅞% Sinking Fund Debentures, due April 1, 1983, were issued provides for sinking fund payments sufficient to retire $5,200,000 of debentures in each of the years 1960 through 1982. The 2.55% notes, due January 1, 1967, provide for prepayments in annual installments of $2,500,000. The 3% notes, due December 1, 1973, provide for prepayments in annual installments of $12,000,000 beginning in 1969.

The aggregate amounts of long-term debt (excluding minor amounts) which will become due during the five years ending December 31, 1963 are: 1959—$5,200,000; and 1960, 1961, 1962 and 1963—$27,050,000 each.

Note 4. Commitments and Contingent Liabilities:

Capital expenditures, including renewals and betterments, under the $600,000,000 five year expansion program announced in 1956, aggregated approximately $428,000,000 through 1958. Although all the projects which are included in the expansion program have not yet been authorized, there were, at the end of 1958, unexpended balances of approximately $39,600,000 on authorized but uncompleted projects. It is expected that approximately $65,000,000 will be expended for capital additions and betterments during 1959, which includes preliminary construction expenditures in connection with the $150,000,000 Brokopondo Development in Suriname, S. A. announced in 1957.

Under an agreement made in 1953, and subsequently amended, the Company has contracted to purchase primary aluminum from a Canadian corporation during the years 1959 through 1962 at the current market price in the United States at the time of shipment. Based upon the quoted market price at December 31, 1958, the amount of this commitment was approximately $84,000,000. The Company has the option to postpone delivery of approximately $21,000,000 of

the above shipments for periods up to a maximum of five years by purchasing aluminum certificates which require the payment of one half of the then current market price of the primary aluminum involved. Also, the Company and the Canadian corporation both have the right to cancel approximately $13,000,000 of the shipments.

Under an agreement made in 1955 with a Norwegian corporation, the Company has contracted to advance, over a period of years, approximately $20,000,000 and deliver about 760,000 metric tons of alumina to that corporation, with repayment to be made in primary aluminum. At December 31, 1958, approximately $13,000,000 had been advanced and 50,000 metric tons of alumina delivered under the agreement. The repayment made in primary aluminum on account of the alumina delivered amounted to the equivalent of approximately 40,000 metric tons of alumina at December 31, 1958.

Contingent liabilities of an indeterminate amount exist in suits and claims arising in the ordinary course of business, the disposition of which is not anticipated to materially affect the financial positions as shown by the accompanying consolidated balance sheet.

Note 5. Employees' Stock Option Plan (Amounts and shares shown hereunder are after giving effect to the 2 for 1 stock splits in 1953 and 1955):

At the annual meeting in 1952, the shareholders approved an Employees' Stock Option Plan and authorized the Company to reserve 1,956,292 shares of its authorized but unissued Common Stock for the granting of options to employees. The Plan, which is administered by a committee appointed by the Board of Directors, provides, among other things, that (a) the committee shall select the officers and employees of the Company and its subsidiaries to whom options shall be granted, (b) the number of shares optioned to one individual may not exceed 5 per cent of the total shares authorized to be reserved under the Plan, (c) the option price of each share of stock covered by an option shall be not less than 95 per cent of the fair market value of the stock at the time the option is granted, and (d) the options are non-transferable during the life of the optionee and the

period of time during which each option may be exercised may not exceed ten years from the date of the option.

On May 15, 1952, February 26, 1954, and July 24, 1956, options were granted under the Plan entitling the holders thereof to acquire Common Stock at a price equal to at least 95 per cent of the fair market value on the dates the options were granted. On March 7, 1958, the Company accepted the cancellation of the outstanding options issued on July 24, 1956 for an aggregate of 193,000 shares and issued, on a share for share basis for such surrendered options, new options to purchase 193,000 shares of the Common Stock of the Company at a price equal to one hundred per cent of the fair market value on the date the option was granted. All of the 1956 options, except one covering 150 shares, were either surrendered to the Company upon issuance of the [fol. 4552] 1958 series or were cancelled or expired without being exercised. The options granted in 1952 and 1954 are exercisable throughout the option period while the options granted in 1958 and the remaining 1956 options, may not be exercised until two years after the granting date. Optionees must exercise their options at stated intervals in accordance with the provisions of the Plan or part of the options will expire. Such options covered a total of 1,057,600 shares at a price of $17.6875 per share, 174,700 shares at a price of $29.375 per share, 198,100 shares at a price of $117.25 per share and 193,000 shares at a price of $68.50 per share, respectively. At December 31, 1958, options for 1,082,434 shares had been exercised and options for 204,616 shares had been cancelled, expired or surrendered, leaving unexercised options for 336,350 shares. In addition, 537,508 shares were reserved for issuance under the Plan for which options had not been granted, making a total of 873,858 shares of Common Stock reserved at December 31, 1958.

The option price and fair market value (based upon the higher of (a) the average of the high and low market quotations for that day, or (b) the closing quotation) of the shares subject to unexercised options, at the dates the options were granted, were as follows:

	Per Share	Total
Granted May 15, 1952 (67,375 shares):		
Option price	$ 17.6875	$ 1,191,695
Fair market value	18.59375	1,252,754

Granted February 26, 1954 (79,319 shares):		
Option price	29.375	2,329,906
Fair market value	30.875	2,448,974
Granted July 24, 1956, less surrendered on March 7, 1958 (150 shares):		
Option price	117.25	17,588
Fair market value	123.25	18,488
Granted March 7, 1958 (189,506 shares):		
Option price	68.50	12,981,161
Fair market value	68.50	12,981,161

Options exercised from the inception of the Plan to December 31, 1958, were as follows: 26,236 shares in 1952, 95,310 shares in 1953, 425,576 shares in 1954, 272,141 shares in 1955, 171,411 shares in 1956, 54,222 shares in 1957, and 37,538 shares in 1958. Proceeds from the sale of this stock amounted to $464,049, $1,685,795, $7,627,000, $5,122,360, $3,434,164, $1,094,546 and $966,470, respectively. The fair market value (based upon the average of the high and low market quotations for each month in which options were exercised, multiplied by the number of option shares issued in the respective months of the periods) of these shares at the dates the options were exercised was approximately $557,000 in 1952, $2,475,000 in 1953, $15,909,000 in 1954, $16,622,000 in 1955, $17,903,000 in 1956, $4,795,000 in 1957, and $2,787,000 in 1958.

Under the Company's practice with respect to accounting for options, no charges are reflected in income.

Note 6. Alcoa Savings Plan for Salaried Employees:

The Alcoa Savings Plan for Salaried Employees, begun on a preliminary basis on November 1, 1957, was approved by the shareholders at their annual meeting in 1958. The Plan provides that all full time salaried employees paid from United States payrolls, with one or more years of continuous service, are eligible to become participants, provided they are not covered by a collective bargaining agreement (unless such agreement provides for participation) and provided they are not eligible to receive supplemental unemployment benefits or similar benefits from the Company. Under the trusteed plan, such employees may save, depending upon length of service, from 2 to 8 per cent of their

annual salaries, and the Company contributes one-half of the employees' savings. Each employee may choose whether all of his savings will be invested in U. S. Savings Bonds, or one-half invested in such bonds and the other half in Common Stock of the Company. The Company contribution will be invested in the Company's Common Stock by the trustee who will purchase, from time to time, all shares at the current price in the open market. While the employee may withdraw his own savings at any time, the Company's contribution with respect to the employee's savings during a calendar year will vest only if the employee leaves such savings in the Plan for three years after the end of that calendar year. The contribution by the Company to the Plan for 1958 amounted to approximately $2,400,000.

Note 7. Properties, Plants and Facilities:

Properties, plants and facilities include approximately $200,000,000 for acquisitions during World War II which have been fully amortized. Substantially all of such assets are presently in use.

[fol. 4553] The cost of all other properties, plants and facilities is depreciated in the accounts on either the straight-line or sum-of-the-years-digits methods over their estimated economic useful lives. The lives assigned to the major classifications of depreciable assets are:

	Years
Buildings and other structures, bridges, etc.	25 to 50
Building service systems, electric, steam, water and sewer lines, etc., and yard facilities	17 to 50
Heavy rolling mills, forge and extrusion presses, shears and hammers	25
Other forming machinery and equipment and machine tools	10 to 17
Smelting pots and furnaces	5 to 25
Steam plant and electric power plant equipment and machinery (except hydroelectric)	17 to 25
Hydroelectric dams, reservoirs, spillways, etc.	100
Hydroelectric turbines and generators, etc.	25
High tension transmission lines and appurtenances	20 to 33
Railroad tracks and equipment:	
Within own plants	17 to 33
Outside	According to I. C. C. regulations
Steamships	17 to 25
Office furniture and equipment	5 to 20

For tax purposes, that portion of the cost of facilities constructed under certain expansion programs which is covered by certificates of necessity is being amortized over a period of sixty months. An appropriate reserve has been provided for future income taxes, thereby recognizing the taxes which will be payable as recorded depreciation exceeds the amount deductible for tax purposes. Income taxes are allocated to income of applicable years whenever there is a material difference between the accounting for book and tax purposes of other items.

The policy with respect to depletion of minerals and gas and oil during 1958 is to record depletion at cost over the period during which the quantities of the resources are extracted. The policy with respect to amortization of patents and other intangibles is to provide ratably from income each year an amount sufficient to equal the costs thereof upon expiration of their respective lives.

Maintenance and repairs are charged to income as incurred. The policy with respect to repair and replacement of certain molds and dies during 1958 is to charge such expenditures to costs as incurred. Major renewals and betterments are capitalized. Spare parts for machinery and equipment are capitalized at the date of purchase and depreciated. When installed, the depreciated cost of spare parts is charged to maintenance and repair expense. When fixed assets are retired or otherwise disposed of, the appropriate reserve is charged with the accumulated amount of amortization, depletion or depreciation applicable to such fixed assets. Profits or losses resulting from such dispositions are included in income, except that certain subsidiaries which are under the jurisdiction of the Federal Power Commission record such items in the reserve for depreciation.

Note 8. Retirement Plans:

The various retirement plans for hourly rated and salaried employees provide that the cost of the plans will be borne entirely by the Company and participating subsidiary companies through annual contributions to trust funds. These contributions consist of actuarially determined contributions for current service and (until the estimated cost of benefits for past service shall have been fully funded) of

contributions for past service in such amounts as the Boards of Directors deem advisable. In general, the plans provide for monthly pensions upon retirement at or after age 65 or upon earlier disability, incapacity or special circumstances. The amount of pension depends upon length of service, remuneration and the amount of certain Social Security and other benefits.

The amount included in costs and expenses under the retirement plans for 1958 was $9,200,441, of which $1,175,582 represented payment for employees' past service. At December 31, 1958, the unpaid amount of past service costs, based on an actuarial estimate, was approximately $9,500,000.

[fol. 4554] Note 9. Certain supplementary profit and loss information is set forth below:

	Charged Directly to Profit and Loss			
	To Cost of Goods Sold or Operating Expenses	Other	Charged to Other Accounts	Total
Maintenance and repairs:				
1958	$47,305,030	$ 479,898	$ —	$47,784,928
1957	60,594,028	531,016	—	61,125,044
1956	61,896,679	504,196	—	62,400,875
Depreciation and depletion of fixed and intangible assets:				
1958	64,165,256	1,494,347	395,227(A) 7,482(B)	66,062,312

[fol. 4555] Exhibit A

Plan and Agreement

This Agreement is made by Aluminum Company of America, a Pennsylvania corporation (herein called Alcoa), and Rome Cable Corporation, a New York corporation (herein called Rome).

Alcoa desires to acquire, through a wholly-owned subsidiary of Alcoa (herein called the Subsidiary), and Rome desires to transfer, all of the assets, properties, contract rights, business and good will of Rome in exchange solely for shares of common stock of Alcoa and the assumption by the Subsidiary of all debts, obligations, liabilities and contract duties of Rome.

Rome desires to provide for the winding up and settling of its affairs in voluntary dissolution and for the distribution of the common stock of Alcoa thus to be acquired by Rome to the shareholders of Rome in complete liquidation and cancellation of the common stock of Rome.

To provide for the consummation of the foregoing objectives, Alcoa and Rome agree as follows:

Article I

Representations and Warranties

Section 1.1. *Representations and Warranties of Rome.*

Rome represents and warrants to Alcoa that:

A. Rome is a corporation duly organized and existing and in good standing under the laws of the State of New York and has power and authority (i) to own or lease its properties and to operate them in the places where such properties are now owned, leased or operated and (ii) to carry on its business in the manner in which such business is now conducted. Rome has no subsidiaries.

B. As of December 31, 1958, the authorized capital stock of Rome consisted of 1,200,000 shares of common stock of the par value of $5.00 per share, of which 591,802 shares had been issued, 557,602 shares of which were then outstanding and 34,200 shares of which were then held in

Rome's treasury. As of December 31, 1958, options had been granted to employees of Rome and were outstanding to purchase an aggregate of 34,440 shares at a price of $25.57 per share.

C. Rome has delivered to Alcoa: (i) balance sheets of Rome as of March 31 for each of the years 1956, 1957 and 1958, together with operating statements and analyses of capital invested for the fiscal years ended with such dates, all certified by Ernst & Ernst, independent public accountants, and (ii) a balance sheet of Rome as of December 31, 1958 and an operating statement and analysis of capital invested for the nine-month period ended December 31, 1958, which are unaudited. All such financial statements for the fiscal years ending March 31, 1956, 1957 and 1958 have been prepared in conformity with generally accepted accounting principles applied on a consistent basis throughout the periods covered thereby, and fairly present the financial condition of Rome at the respective dates and the results of operations of Rome for the indicated periods. The balance sheet of Rome as of December 31, 1958 and the operating statement and analysis of capital invested for the nine-month period then ended have been prepared in conformity with the accounting principles regularly employed by Rome in the preparation of its interim statements and are subject to audit and fiscal year-end adjustments.

D. Rome had no liabilities at March 31, 1958 which are not shown or provided for on the balance sheet of Rome as of March 31, 1958 except such as may arise out of contract obligations and other commitments theretofore incurred or made in the ordinary course of business.

E. Rome has not, since March 31, 1958:

(i) entered into any transactions other than in the ordinary course of business;

(ii) paid any dividends or made any other distributions to its shareholders except dividends of 25¢ per share paid on July 1, 1958, October 1, 1958, and January 3, 1959, and of 25¢ per share to be paid on or about March 18, 1959 to shareholders of record on or about February 27, 1959;

[fol. 4556] (iii) issued or sold, or granted any op-

tions to buy, or agreed to issue or sell, or to grant any options to buy, any stocks, bonds or other corporate securities except shares of common stock issued or sold pursuant to stock options outstanding on December 31, 1958;

(iv) incurred or agreed to incur any liability or obligation except current liabilities and obligations entered into in the ordinary course of business;

(v) mortgaged, pledged or subjected to any lien, charge or other encumbrance any of its assets, tangible or intangible;

(vi) sold or transferred any of its tangible assets or canceled any debts or claims except in the ordinary course of business;

(vii) sold, assigned or transferred any patents, trademarks, trade names, copyrights or other intangible assets;

(viii) suffered any extraordinary losses or waived any rights or claims having more than nominal value.

F. Rome has filed all federal, state and local tax returns required to be filed and has paid all taxes shown by such returns to be due and payable. The Internal Revenue Service has audited the federal income and excess profits tax returns filed by Rome for all fiscal years through the fiscal year ending in 1954 and has claimed no deficiencies with respect to such years which have not been paid. No state or local taxing authority has asserted any tax deficiency which has not been paid or for the payment of which adequate provision has not been made.

G. There are no actions, suits or proceedings pending or, to the knowledge of Rome, threatened against or affecting Rome which are material to its business, properties or financial condition. Rome is not in default with respect to any judgment, order, writ, injunction, decree, assessment or other similar command of any court or of any federal, state, municipal or other governmental department, commission, board, bureau, agency or instrumentality.

H. Rome has good and marketable title in fee simple to all real properties and improvements thereon included in its assets as shown in its said balance sheet as of March

31, 1958, and to such real properties and improvements thereon as have been acquired or made since that date, subject only to the lien of current state and local property taxes and assessments, payment whereof is not delinquent, and to minor restrictions, covenants, easements, rights and licenses of record which do not impair the use of such property for the business of Rome. Rome owns outright, free and clear of all liens and encumbrances, all machinery, equipment, inventories and other personal property reflected in its balance sheet as of March 31, 1958, and all machinery, equipment, inventories and other personal property acquired by it since March 31, 1958, except such as it has disposed of since that date in the ordinary course of business.

I. The execution and delivery of this Agreement and the consummation of the transactions contemplated hereby will not result in any breach or violation of, or default under, any agreement or other instrument to which Rome is a party or by which it is bound, except that (i) if the consent of J. P. Morgan & Co. Incorporated, The Connecticut Mutual Life Insurance Company and Massachusetts Mutual Life Insurance Company, or other holder or holders of Rome's promissory notes issued in connection with a borrowing by Rome in 1957 of $5,000,000, shall not be secured, the consummation of the transactions contemplated hereby may constitute a default under said promissory notes, and, (ii) if Rome has any claims, contracts, leases, licenses, rights or obligations which are not by their terms or by law assignable without the consent of any other party thereto, then the consummation of the transactions contemplated hereby may constitute a default thereunder.

J. Rome has not agreed, or become liable, to pay any fee or commission in the nature of a finder's or originator's fee in connection with the subject matter of this Agreement.

K. There have been no changes in the condition of Rome, financial or otherwise, as shown in its said balance sheet as of March 31, 1958, other than changes which occurred in the ordinary course of business, and none of [fol. 4557] such changes (other than as reflected in Rome's balance sheet as of December 31, 1958) had a

material adverse effect on Rome's financial condition, results of its operations or its properties.

Section 1.2. *Representations and Warranties of Alcoa.*

Alcoa represents and warrants to Rome that:

A. Alcoa is a corporation duly organized and existing and in good standing under the laws of the Commonwealth of Pennsylvania.

B. As of February 6, 1959, the authorized capital stock of Alcoa consisted of: (i) 1,000,000 shares of serial preferred stock of the par value of $100.00 per share, of which 660,000 shares of a series designated "$3.75 Cumulative Preferred Stock" had been authorized, 659,909 shares of which had been issued and were then outstanding; and (ii) 50,000,000 shares of common stock of the par value of $1.00 per share of which 20,655,992 shares had been issued and were then outstanding. As of February 6, 1959 options had been granted to employees of Alcoa and were outstanding to purchase the following numbers of shares of common stock at the following prices: 60,628 shares at $17.6875 per share, 77,095 shares at $29.3750 per share, 150 shares at $117.25 per share, and 187,151 shares at $68.50 per share.

C. Alcoa has delivered to Rome a consolidated balance sheet of Alcoa as of December 31, 1958, together with a statement of consolidated income and retained earnings and a statement of consolidated additional capital for the year ended December 31, 1958, all certified by Lybrand, Ross Bros. & Montgomery, independent public accountants. Such statements have been prepared in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year, and fairly present the financial condition of Alcoa as of December 31, 1958 and the results of operations of Alcoa for the year ended December 31, 1958.

D. There have been no changes in the condition of Alcoa, financial or otherwise, as shown in its said balance sheet as of December 31, 1958, other than (i) changes which occurred in the ordinary course of business and (ii) changes which occurred outside the ordinary course of business but did not have a material adverse effect on

Alcoa's financial condition, results of its operations or its properties.

Article II

Covenants

Section 2.1. *Negative Covenants of Rome.*

From and after the date of this Agreement and until the Closing Date, Rome shall not:

A. Grant any general increases in rates of pay to its hourly paid employees except increases resulting from existing contracts with labor unions, or grant any material increase in the salaries of any other employees or make any material increase in other benefits to which employees may be entitled.

B. Amend its Certificate of Incorporation or its by-laws except to change its name.

Section 2.2. *Affirmative Covenants of Rome.*

A. Forthwith upon the execution and delivery of this Agreement, Rome shall:

(i) Deliver to Alcoa a true and complete list of all real properties owned by or leased to Rome as of the date of this Agreement, and supplement the same with a list or lists of real properties thereafter acquired or leased, including in such list or lists all plants, structures and other improvements on such real properties, together with a statement as of March 31, 1958 (or as of any later date of acquisition) of the gross book value, book reserve for depreciation, net book value, basis of valuation, and depreciation and amortization policy with respect thereto.

(ii) Deliver to Alcoa a true and complete list and brief description of all patents, patent applications, trademark registrations and copyrights owned by Rome or in which it has any rights as of the date of this Agreement, to- [fol. 4558] gether with a brief description of the nature of such rights, and supplement the same with a list or lists of such property or rights thereafter acquired, provided that Alcoa shall accord confidential treatment to the content of patent applications so revealed.

(iii) Deliver to Alcoa a true and complete list, and make available for inspection by Alcoa a true copy, of the following described contracts and other instruments to which Rome is or shall be a party or by which it is or shall be bound:

(a) All employment contracts and collective bargaining or other labor agreements;

(b) All pension, retirement, stock option, profit-sharing, group insurance or other incentive or welfare contracts and all trust agreements relating thereto;

(c) All contracts for the purchase of any materials, supplies or equipment or for the sale of Rome's products which extend beyond December 31, 1959;

(d) All leases of any property, real or personal, with respect to which Rome is either lessor or lessee;

(e) All notes and agreements relating to any indebtedness of Rome which matures after March 31, 1959;

(f) All other contracts not made in the ordinary course of business.

(iv) Deliver to Alcoa a true and complete list and brief description of all policies of fire, liability and other forms of insurance held by Rome, and maintain and keep such insurance in full force and effect.

(v) Call a special meeting of its shareholders to be held on March 25, 1959 (or other date acceptable to Alcoa), for the purpose of considering and approving this Agreement and authorizing the consummation of the transactions contemplated hereby.

B. From and after the date of this Agreement and until the Closing Date, Rome shall:

(i) Carry on its business in substantially the same manner as heretofore and not make any purchase or sale or introduce any method of management or operation in respect of its business or properties except in a manner consistent with its prior practices.

(ii) Use its best efforts to maintain and preserve its business organization intact, to retain its present employees and to maintain its relationships with its customers and others.

(iii) Permit Alcoa and its authorized representatives to have full access to all properties, records and documents of Rome and furnish to Alcoa such financial and other information with respect to the business and properties of Rome as Alcoa may from time to time reasonably request; provided, however, that any furnishing by Rome of such information to Alcoa or any making by Alcoa of such investigation shall not affect the right of Alcoa to rely upon the representations and warranties of Rome, and provided further that Alcoa shall use its best efforts to keep all such information confidential but shall be under no liability for any disclosure which may occur in spite of such best efforts.

C. At or after the Closing Date, Rome shall:

(i) Take such action as shall be necessary to effect the termination of Rome's profit-sharing plan for employees and the distribution of assets held in trust thereunder.

(ii) Take such action with respect to all pension, retirement, stock option, group insurance or other incentive or welfare plans of Rome as Alcoa shall reasonably direct.

Section 2.3. *Covenants of Alcoa.*

From and after the date of this Agreement and until the Closing Date, Alcoa:

A. Shall not subdivide or otherwise reclassify its capital stock.

B. Shall not issue any additional capital stock except such as may be issued pursuant to the exercise of stock options outstanding on February 6, 1959 and except such as may be issued under the Alcoa Savings Plan for Salaried Employees.

[fol. 4559] C. Shall take such corporate action as shall be necessary to carry out the transactions contemplated hereby and shall cause the Subsidiary to be incorporated and to be registered to do business in states where such registration shall be deemed necessary.

Article III

Conditions

Section 3.1. *Conditions of Alcoa's Obligations.*

The obligations of Alcoa under this Agreement are subject to the satisfaction of the following conditions:

A. All representations and warranties of Rome contained in this Agreement shall be true and correct on and as of the Closing Date, with the same force and effect as though such representations and warranties had been made on and as of the Closing Date, except as to transactions contemplated herein and changes which occurred in the ordinary course of business after the date hereof and did not have a material adverse effect on the operation, properties or financial condition of Rome.

B. Rome shall have delivered to Alcoa a certificate, dated as of the Closing Date and signed by the President or a Vice President and by the Comptroller or Assistant Comptroller of Rome, stated to be to the best of their knowledge and belief, to the effect stated in clause A of this Section 3.1.

C. Rome shall have fully complied with all covenants stated in Sections 2.1 and 2.2 hereof.

D. Rome shall have used its best efforts, (i) to have secured the consent of J. P. Morgan & Co. Incorporated, The Connecticut Mutual Life Insurance Company and Massachusetts Mutual Life Insurance Company, or other holder or holders of Rome's promissory notes issued in connection with a borrowing by Rome in 1957 of $5,000,000, to the transactions contemplated by this Agreement, and (ii) to provide for Alcoa or the subsidiary the benefits of such claims, contracts, licenses, leases or rights as may be non-assignable, including enforcement, not at the cost of Rome, of any and all rights of Rome against the other party thereto.

E. The holders of at least two-thirds of the issued and outstanding shares of common stock of Rome entitled to vote thereon shall have voted in favor of this Agreement and of the consummation of the transactions contemplated herein.

F. Alcoa shall have received from Messrs. Ferris, Hughes, Dorrance and Groben, or other counsel for Rome satisfactory to Alcoa, an opinion, in form and substance satisfactory to Alcoa and dated the Closing Date, to the effect that:

(i) Rome is a corporation duly organized and existing and in good standing under the laws of the State of New York and has power and authority (a) to own or lease its properties and to operate them in the places where such properties are then owned, leased or operated and (b) to carry on its business in the manner in which such business is then conducted;

(ii) Rome has full power and authority to convey, assign, transfer and deliver the assets of Rome as herein provided;

(iii) All corporate and other proceedings required to be taken by or on the part of Rome to authorize it to carry out this Agreement and to convey, assign, transfer and deliver the assets of Rome as herein provided have been duly and properly taken;

(iv) The title of Rome in and to its real properties is a good and marketable title in fee simple, free and clear of all mortgages, liens, charges or encumbrances of any nature except the lien of current state and local property taxes and assessments, payment whereof is not delinquent, and except as to minor restrictions, covenants, easements, rights and licenses of record which do not impair the use of such property for the business of Rome, and that Rome has good title to the property and assets of Rome other than real property;

(v) The instruments of transfer and conveyance tendered to the Subsidiary are sufficient to vest in the Subsidiary such title to all of the assets of Rome as a going concern as was vested in Rome immediately prior to the delivery thereof;

and to such other effect as Alcoa may reasonably require. [fol. 4560] G. Alcoa shall have received a letter from Ernst & Ernst, dated the Closing Date, stating in effect that on the basis of a limited review (but not an audit or "examination" as used in accountants' certificates) of the financial statements of Rome for the period subsequent to

March 31, 1958, consultations with officers of Rome responsible for financial and accounting matters and other specified procedures and inquiries they have no reason to believe that:

(i) The statement of financial condition of Rome as of March 31, 1956, 1957 and 1958 and the operating statement and analysis of capital invested for the fiscal years ended with such dates (on which they have previously reported) do not now fairly present the financial condition of Rome at the respective dates, and the results of operations of Rome for the indicated periods and were not prepared in accordance with generally accepted accounting principles applied on a consistent basis.

(ii) There has been any material change in the accounting principles followed by Rome since March 31, 1958, and

(iii) Except as set forth or contemplated in this Agreement, during the period from March 31, 1958 to a date not more than five days prior to the Closing Date there was any change in the issued capital stock or funded debt of Rome other than payment in accordance with the terms thereof, or any material change in the financial position other than in the ordinary course of business or that Rome entered into any material financial transactions not in the ordinary course of business.

Section 3.2. *Conditions of Rome's Obligations.*

The obligations of Rome under this Agreement are subject to the satisfaction of the following conditions:

A. All representations and warranties of Alcoa contained in this Agreement shall be true and correct on and as of the Closing Date with the same force and effect as though such representations and warranties had been made on and as of the Closing Date, except as to transactions contemplated herein and (i) changes which occurred in the ordinary course of business after the date hereof and (ii) changes which occurred outside the ordinary course of business after the date hereof but did not have a material adverse effect on the operations, properties or financial condition of Alcoa.

B. Alcoa shall have delivered to Rome a certificate, dated as of the Closing Date and signed by the President or a Vice President and the Controller or Assistant Controller of Alcoa, stated to be to the best of their knowledge and belief, to the effect stated in clause A of this Section 3.2.

C. Alcoa shall have fully complied with all covenants stated in Section 2.3 hereof.

D. Rome shall have received from the Internal Revenue Service a ruling, in form and substance satisfactory to Rome, with respect to the federal income tax consequences of the transactions contemplated hereby.

E. The holders of at least two-thirds of the issued and outstanding shares of common stock of Rome entitled to vote thereon shall have voted in favor of this Agreement and of the transactions contemplated herein.

F. There shall not have been objection to the transfer of Rome's assets and demand for payment of the value of their shares of Rome common stock as provided in Sections 20 and 21 of the New York Stock Corporation Law by the holders of more than 10% of the issued and outstanding shares of common stock of Rome.

G. Rome shall have received from the General Counsel of Alcoa an opinion, in form and substance satisfactory to Rome and dated the Closing Date, to the effect that:

(i) Alcoa is a corporation duly organized and existing and in good standing under the laws of the Commonwealth of Pennsylvania;

(ii) All corporate and other proceedings required to be taken by or on the part of Alcoa to authorize it to carry out this Agreement and to issue and deliver the shares of common stock of Alcoa, deliverable pursuant hereto, have been duly and properly taken;

(iii) Said shares of common stock of Alcoa will, on delivery thereof to Rome, in accordance with the terms hereof, be duly and validly issued, fully paid and nonassessable, that registration of the said shares under [fol. 4561] the Securities Act of 1933 is not required (or if required has been duly accomplished), and that the said shares have been duly listed on the New York Stock Exchange.

Article IV

Consummation of Transactions

Section 4.1. *Transfer of Rome's Assets.*

On the Closing Date Rome shall convey, assign, transfer and deliver to the Subsidiary all assets, properties, contract rights, business and good will of Rome of every kind and description and wherever located as the same shall exist on the Closing Date (herein sometimes collectively called assets of Rome) except such amounts of cash or other assets as may be retained pursuant to Section 4.6 hereof and except the minute books and stock books of Rome and any records required by law to be retained by Rome, provided that within a reasonable time after the dissolution of Rome, Rome shall, unless otherwise required by law, deliver to Alcoa or to the Subsidiary, as Alcoa shall direct, the minute books, stock books and all other records of Rome. The transfer shall be effected by such instruments as Alcoa shall reasonably request. Rome shall from time to time as the same is received by it after the Closing Date, pay over to the Subsidiary all cash received by Rome from the exercise by its employees of options to purchase common stock of Rome.

Section 4.2. *Assumption of Rome's Liabilities.*

On the Closing Date Alcoa shall cause the Subsidiary to assume and agree to pay, perform and discharge all debts, obligations, liabilities and contract duties of Rome as the same shall exist on the Closing Date, except expenses for the payment of which Rome shall retain cash or other assets as provided in Section 4.6 hereof. The Subsidiary shall execute such instruments as Rome shall reasonably request. Notwithstanding any other provision of this Agreement and except as otherwise specifically provided in this Article IV, neither Alcoa nor the Subsidiary shall assume any obligation of Rome with respect to options granted by Rome to its employees to purchase common stock of Rome.

Section 4.3. *Transfer of Alcoa Stock.*

On the Closing Date Alcoa shall cause the Subsidiary to transfer to Rome such number of shares of common stock of Alcoa, not to exceed 355,226 shares, as shall be equal to

6/10 (rounded off to the next higher full share) of the aggregate number of shares of common stock of Rome which are issued and outstanding on the Closing Date (exclusive of any shares held in the treasury of Rome) and with respect to which any unexercised stock option granted by Rome to its employees prior to December 31, 1958 shall be outstanding. Alcoa shall take all such action as it may and as shall be required to cause the said shares of common stock of Alcoa to be listed on the New York Stock Exchange on the Closing Date.

Section 4.4. *Dissolution of Rome.*

On or as promptly as practicable after the Closing Date Rome shall take such steps as may be required under the laws of New York to dissolve and terminate its corporate existence and shall distribute to its shareholders, against surrender of and in exchange for their respective certificates for shares of common stock of Rome, certificates for shares of common stock of Alcoa at the rate of 6/10 of one share of common stock of Alcoa for each issued and outstanding share of common stock of Rome. Such distribution shall be effected by depositing with Guaranty Trust Company of New York (herein called the Trust Company), as depository for the shareholders of Rome, all the shares of common stock of Alcoa received hereunder, and the Trust Company, upon receipt of certificates for shares of common stock of Rome, shall deliver to or upon the order of the respective owners of such Rome shares, certificates for the number of whole shares of common stock of Alcoa to which such owners are entitled, together with any dividends which the Trust Company as such depository shall have received subsequent to the Closing Date with respect to such shares so held by it. Certificates for fractional shares of common stock of Alcoa shall not be issued in connection with such exchange. In lieu thereof Rome and Alcoa shall take appropriate action to permit, for a period of 120 days after the Closing Date (the date of expiration of said period being herein call the Expiration Date), the purchase and sale of fractional interests in shares of common stock of Alcoa by Rome shareholders [fol. 4562] who, except for the preceding sentence, would have been entitled to certificates for fractional shares of common stock of Alcoa. At such time or times after the

Expiration Date as the Trust Company shall reasonably determine, the Trust Company, acting as agent for each shareholder of Rome who is, according to the stock transfer books and records of Rome as of the close of business on the Expiration Date, entitled to a fractional interest in any share of Alcoa common stock, shall sell the share or shares representing the aggregate of such fractional interests and shall remit to each such shareholder his proportionate interest in the net proceeds of such sale against surrender by such shareholder of his certificate or certificates representing shares of common stock of Rome.

Section 4.5. *Re-Transfer of Alcoa Shares in Certain Cases.*

If any shareholder of Rome shall have objected to the transfer of Rome's assets and shall have demanded the payment of the value of his shares of Rome common stock pursuant to the applicable provisions of the laws of New York, the shares of common stock of Alcoa to which such shareholder of Rome would otherwise have been entitled shall not be distributed to such shareholder of Rome. After such shareholder of Rome shall have received payment of the value of his shares of Rome common stock and shall have transferred such shares to Rome, Alcoa or the Subsidiary, as Alcoa shall direct, shall be entitled to the shares of common stock of Alcoa, including a fractional interest in any share, to which such shareholder would otherwise have been entitled. From time to time thereafter, upon surrender of Rome certificates, and as requested by Alcoa, the Trust Company shall deliver to Alcoa or the Subsidiary the certificate or certificates for such shares of Alcoa common stock and shall also pay Alcoa or the Subsidiary any dividends which the Trust Company shall have received with respect to such shares. If any employee of Rome holding an option to purchase common stock of Rome granted by Rome prior to December 31, 1958 shall fail to exercise the same in full within three months after the Closing Date, the shares of common stock of Alcoa to which such employee would have been entitled upon exchange for shares of common stock of Rome which he would have acquired had he exercised the said option in full shall not be delivered to him, and from time to time thereafter, as requested by Alcoa, the Trust Company shall deliver to Alcoa or the Subsidiary the cer-

tificate or certificates for such shares of Alcoa common stock and shall also pay Alcoa or the Subsidiary any dividends which the Trust Company shall have received with respect to such shares. Whenever, after December 31, 1962, Alcoa shall so request the Trust Company shall deliver and pay to Alcoa or to the Subsidiary certificates for any and all shares of common stock of Alcoa not theretofore transferred to shareholders of Rome in exchange for certificates for common stock of Rome, and the net proceeds of the sale of shares in which there are fractional interests, together with all dividend monies received by the Trust Company with respect to such shares. Thereafter the holders of such shares of common stock of Rome shall, if and to the extent that they shall have any rights thereto, look only to Alcoa or the Subsidiary, as the case may be, for delivery of certificates for such full shares of Alcoa common stock, payment of their proportionate interests in such net proceeds of the sale of shares in which there were fractional interests and payment of such dividend monies allocable thereto upon surrender of their shares of Rome common stock for exchange.

Section 4.6. *Retention of Cash or other Assets by Rome.*

Rome shall retain in a separate fund cash or other assets or both in such amount as Rome shall reasonably deem sufficient to enable Rome to pay all expenses incurred or to be incurred by Rome in carrying out this Agreement and not paid by Rome prior to the Closing Date. Such expenses shall include but not be limited to payments to shareholders of Rome who object to the transfer of the assets of Rome and demand payment for their shares of Rome stock and any expenses incurred in connection with any proceedings to fix the value of Rome stock for such purpose. Any balance remaining in such fund after all such expenses shall be paid or adequately provided for shall be paid over and transferred to the Subsidiary.

Section 4.7. *Alternate Provision Concerning Rome Stock Options.*

A. The provisions of paragraph B of this Section 4.7 may, by mutual agreement of Alcoa and Rome, be applied in lieu of the provisions elsewhere made in this Article IV (except

in Section 4.2) with respect to options granted by Rome to its employees to purchase common stock of Rome. In the event that the provisions of paragraph B of this Section 4.7 are applied, shares of common stock of Rome with respect to which any unexercised stock option shall be outstanding on the Closing Date shall not be included in the aggregate [fol. 4563] number of shares of common stock of Rome referred to in Section 4.3 for the purpose of determining the number of shares of common stock of Alcoa to be delivered under the provisions of Section 4.3.

B. Alcoa shall assume each option granted by Rome to its employees prior to December 31, 1958 to purchase common stock of Rome which has not been fully exercised on or prior to the Closing Date, to the end that by exercise of each such option the optionee may, for the price of $25.57 and under the terms of said option, purchase 6/10ths of one share of Alcoa common stock for each share of common stock of Rome with respect to which such option might have been but was not exercised as of the Closing Date, provided that the number of shares of Alcoa common stock that may be purchased under any such option shall not include any fractional share but shall be rounded off to the next lower full share.

Section 4.8. *Further Assurances.*

At any time and from time to time after the Closing Date, upon the request of Alcoa, Rome will do, execute, acknowledge and deliver or will cause to be done, executed, acknowledged and delivered, all such further acts, deeds, assignments, transfers, conveyances, powers of attorney and assurances as may be required for the better assigning, transferring, granting, conveying, assuring and confirming to the Subsidiary and its successors and assigns, or for aiding and assisting in collecting and reducing to possession, the assets of Rome to be assigned to the Subsidiary as herein provided.

Article V

Miscellaneous

Section 5.1. *Closing Date.*

The Closing Date shall be March 31, 1959, provided that either Alcoa or Rome may, at any time and from time to

time, by written notice to the other, postpone the closing to a date not later than the close of business on April 30, 1959. Subject to the provisions of Section 5.8 hereof, Alcoa and Rome, by mutual consent, may postpone the closing date beyond April 30, 1959.

Section 5.2. *Place of Closing.*

The consummation of the transactions contemplated by this Agreement shall take place at the office of Rome in Rome, New York, or at such other place as Rome and Alcoa shall mutually determine.

Section 5.3. *Bulk Sales Laws.*

Alcoa hereby waives and will cause the Subsidiary to waive compliance by Rome with the provisions of any applicable bulk sales law.

Section 5.4. *Election of Alcoa with respect to Subsidiary.*

The right is reserved to Alcoa to effect the acquisition of assets of Rome by the Subsidiary and the assumption of liabilities of Rome by the Subsidiary by the direct acquisition of the assets of Rome by Alcoa from Rome in exchange for shares of common stock of Alcoa and the assumption of liabilities of Rome by Alcoa, and the subsequent transfer of all or less than all of said assets by Alcoa to the Subsidiary in exchange for capital stock of the Subsidiary and the assumption by the Subsidiary of all or less than all of said liabilities.

Section 5.5 *Name of the Subsidiary.*

Rome consents to the use of the name "Rome Cable Corporation" by the Subsidiary or to the use of the word "Rome" in any other manner in the corporate name of the Subsidiary. Rome shall cooperate fully with Alcoa and the Subsidiary in connection with the incorporation of the Subsidiary and the registration thereof to do business in states where such registration is deemed necessary.

[fol. 4564] Section 5.6. *Notices.*

All notices or other communications required or permitted to be given hereunder shall be in writing and shall be sufficiently given to Alcoa if delivered personally to its President or if sent by registered or certified mail, addressed to:

Aluminum Company of America
1501 Alcoa Building
Pittsburgh 19, Pennsylvania
Attention of F. L. Magee, President

and to Rome if delivered personally to its President or if sent by registered or certified mail, addressed to:

Rome Cable Corporation
Rome, New York
Attention of A. D. Ross Fraser, President.

The designation of the person to be so notified or the address of such person may be changed from time to time by similar written notice.

Section 5.7. *Parties in Interest.*

This Agreement shall be binding upon and inure to the benefit of the parties hereto and their respective successors and assigns but shall not be assignable by either party without the written consent of the other party. Nothing in this Agreement, express or implied, is intended or shall be construed to confer upon any person other than the parties hereto any right, remedy or claim under or by reason of this Agreement.

Section 5.8. *Integration, Modification and Termination.*

This Agreement is the entire agreement between the parties hereto with respect to the subject matter hereof. Alcoa and Rome, by the mutual consent of their respective Boards of Directors or Executive Committees, or officers authorized by such boards or committees, may amend or modify this Agreement by a written instrument executed by Alcoa and Rome, provided, however, that no such amendment or modification shall change the number of shares of common stock of Alcoa to be delivered to Rome hereunder or make any material change in the provisions of this Agreement relating to the transfer of Rome's assets to and the assumption of its liabilities by the Subsidiary and the distribution to Rome's shareholders of such shares of common stock of Alcoa against surrender by such shareholders for cancellation of their certificates for outstanding shares of common stock of Rome, or alter the right of the share-

holders of Rome to terminate this Agreement as hereinafter provided in this Section. Notwithstanding any other provision hereof, this Agreement may be terminated at any time by mutual consent of the Boards of Directors or the Executive Committees of Alcoa and Rome. If, by mutual consent of Alcoa and Rome, the period within which the closing may be held is extended beyond April 30, 1959, the shareholders of Rome may direct the termination of this Agreement by affirmative vote of holders of record of a majority of the outstanding shares of the corporation represented and voting at any annual meeting of shareholders of Rome held after December 31, 1959, if the closing shall not have been held prior to the date of such annual meeting. In the event of any such direction by the shareholders of Rome, this Agreement shall thereupon be terminated. In the event of such termination in either such manner neither party shall have any liability of any kind to the other party or to any shareholder of such other party with respect to any matter arising out of this Agreement.

Section 5.9. *Interpretation.*

This Agreement shall be construed in accordance with the laws of the Commonwealth of Pennsylvania. The titles of the articles and sections have been inserted as a matter of convenience of reference only and shall not control or affect the meaning or construction of this Agreement.

[fol. 4565] Section 5.10. *Counterparts.*

A separate counterpart of this Agreement may be executed by each of the parties and both such counterparts taken together shall constitute a single instrument.

The parties have executed this Agreement this 17th day of February, 1959.

Aluminum Company of America, By I. W. Wilson, Chairman of the Board.

Attest:

Alfred M. Hunt, Secretary.

Rome Cable Corporation, By A. D. R. Fraser, President.

Attest:

Gerard A. Weiss, Secretary.

[fol. 4566] Exhibit B.

Stock Corporation Law of the State of New York

Section 20

Voluntary Sale

§ 20. Voluntary sale, lease or exchange of property, rights, privileges and franchises and rights of objecting stockholders.

A stock corporation, except as otherwise provided by law or by its certificate of incorporation or other certificate filed pursuant to law, may voluntarily sell, lease or exchange its property, rights, privileges and franchises, or any interest therein or any part thereof; provided, however, that if such sale, lease or exchange is not made in the regular course of business of the corporation and involves all or substantially all of its property, rights, privileges and franchises, or an integral part thereof essential to the conduct of the business of the corporation, such sale, lease or exchange shall not be made without the consent of either the holders of record of all of its outstanding shares entitled to vote thereon given in writing without a meeting or the holders of record of two-thirds of its outstanding shares entitled to vote thereon obtained at a meeting of the stockholders called pursuant to section forty-five. Franchises within the state may be sold only to a domestic corporation.

If the sale, lease or exchange may not be made without the consent of stockholders and such consent is obtained at a stockholders' meeting, any stockholder entitled to vote thereon and not voting in favor of such proposed sale, lease or exchange may at any time prior to the vote thereon—or if notice of the meeting was not mailed to him at least twenty days prior to the taking of such vote, then within twenty days after the mailing of such notice—object to such sale, lease or exchange and demand payment for his stock, and thereupon such stockholder or the corporation shall have the right, subject to the conditions and provisions of section twenty-one, to have such stock appraised and paid for as provided in said section. Such objection and demand must be in writing and filed with the corporation,

The provisions of this section shall not apply to a railroad corporation.

Section 21

Appraisal of Stock of Objecting Stockholder

§ 21. *Determination of value of stock of objecting stockholder.* 1. In the event that the stockholders of a corporation have taken action pursuant to sections fourteen, twenty, eighty-five, eighty-six or ninety-one or pursuant to article four and if any stockholder has objected to such action and demanded payment for his stock as provided in section fourteen, section twenty, subdivision seven of section eighty-five, section eighty-seven, section ninety-one or subdivision eleven of section thirty-eight, as the case may be, the corporation, within ten days after the last day on which a demand for payment might have been made, shall mail by registered mail to such objecting stockholder or deliver personally to him a written offer to pay for such stock in cash at a price deemed by the corporation to be the value thereof; and an offer so made to any such objecting stockholder shall also be made on the same terms and conditions and at the same price per share to all such objecting holders of shares of the same class of stock. If mailed, such offer shall be directed to such stockholder at his address as it appears on the stock-book unless he shall have filed with the secretary of the corporation a written request that notices intended for him be mailed to some other address, in which case it shall be mailed to the address designated in such notice. Such offer shall be accompanied by a balance sheet of the corporation as of a date not more than six months prior to the making of such offer and a profit and loss statement for the twelve months' period ended on the date of such balance sheet; provided, that if it is impracticable to furnish a balance sheet as of a date within such six months' period, a balance sheet as of such earlier date as shall be practicable, but not earlier than the end of the corporation's preceding fiscal year, shall be furnished, in which event the profit and loss statement shall be for the twelve months' period ended on the date of such balance sheet.

[fol. 4567] 2. The corporation may apply to the purchase of stock pursuant to an offer made as provided in subdivi-

sion one hereof, such of its assets as are lawfully available for the purchase of shares of its stock, and an amount of its capital not exceeding the capital represented by the shares so purchased; provided, that the effect of any such purchase and application of capital thereto shall not be to reduce the actual value of the assets of the corporation to an amount less than the total amount of its debts and liabilities, plus the amount of its capital reduced by the amount of capital so applied. The use of capital to such extent for such purpose shall not be deemed to be the declaration or payment of a dividend or a distribution of assets within the meaning of section fifty-eight of the stock corporation law, or constitute a violation of section six hundred sixty-four of the penal law. The shares of stock so purchased may be held or disposed of by the corporation; provided, that the corporation, by resolution of its board of directors, may retire any shares so purchased, and shall retire any thereof purchased through the application of capital, by filing a certificate entitled "Certificate of reduction of capital of (name of corporation) pursuant to section twenty-one of the stock corporation law". Such certificate shall contain the statements prescribed in section thirty-six for certificates under subdivision two and subdivision four of section thirty-five to effect a reduction of capital and the elimination of previously authorized shares, and the reduction of capital stock in conformity therewith. Such certificate shall be subscribed and acknowledged by the president or a vice-president and the secretary or an assistant secretary who shall make and annex an affidavit that they have been authorized to execute and file such certificate by resolution of the board of directors, adopted at a directors' meeting duly called and held on a date specified in such affidavit. There shall be annexed to such certificate an affidavit of the president or a vice-president and also an affidavit of the treasurer or a majority of the directors stating that the actual value of the assets of the corporation is not less than the total amount of the debts and liabilities of the corporation plus the proposed amount of its capital. Such certificate shall be filed as provided in section thirty-eight in respect of certificates under section thirty-six. Upon the filing of such certificate the shares so purchased shall be eliminated from the authorized capital stock or number of

shares of the corporation, and the capital of the corporation shall be reduced by an amount equal to the amount of capital represented by the shares so retired. The capital of the corporation represented by any shares of stock purchased or otherwise acquired by it pursuant to any provision of this section shall be determined as provided in subdivision two of section twenty-nine.

3. If the corporation shall fail to make an offer within the time specified in subdivision one hereof, or if the objecting stockholder shall fail to accept an offer from the corporation within twenty days after the mailing or delivery thereof, either such stockholder or the corporation may petition the supreme court, at any special term thereof held in the judicial district in which the principal office of the corporation is situated, to determine the value of such stock. Such petition shall be made on five days' notice and shall be made returnable in such court on the fiftieth day after the last day on which the demand of the objecting stockholder for payment might have been made, or, if the rules or practice of such court do not permit such petition to be made returnable on such fiftieth day, then it shall be made returnable on the first succeeding day permitted by such rules or practice. If more than one such proceeding shall have been instituted, the court, in its discretion, may, or on motion of the corporation shall, enter an order directing the consolidation of all proceedings and making such directions with respect to the conduct of the consolidated proceeding as it shall deem proper. Two or more objecting stockholders may join or be joined in any such proceeding.

4. The court shall determine which of the objecting stockholders have complied with the provisions of section fourteen, section twenty, subdivision eleven of section thirty-eight, subdivision seven of section eighty-five, section eighty-seven or subdivision seven of section ninety-one, whichever shall be applicable, and thereby become entitled to have the value of their stock determined. If the court shall find that any of the objecting stockholders are so entitled, it shall proceed to determine the value of their stock, or shall appoint an appraiser to determine such value, and may make such directions in regard to the proceeding as it shall deem proper. If the court shall determine such value without appointing an appraiser, judgment shall be entered against

the corporation and in favor of each objecting stockholder party to the proceeding for the value of his stock so determined. If an appraiser shall be appointed, he shall be duly sworn honestly and faithfully to discharge his duties and thereupon shall proceed to determine the value of such stock, considering all relevant legal evidence which may be produced, and shall cause a stenographic transcript of the testimony to be taken. For all the purposes of this section, such value shall be determined as of the close of business on the day before the taking of the stockholders' vote on the action [fol. 4568] to which objection was made, excluding any appreciation or depreciation directly or indirectly consequent upon such action or the proposal thereof. The appraiser may require any person to attend before him as a witness, and shall have the same powers with respect to all proceedings before him as are conferred upon a person authorized by law to hear, try or determine a matter in relation to which proof may be taken. The appraiser's report shall state his conclusion as to the value of the stock and his reasons therefor, and he shall file such report, together with the transcript of testimony and all exhibits which shall have been offered, with the court within sixty days after his appointment, or within such later period as the court may direct, and shall serve one copy of the report by mail on each party to the proceeding. The court shall consider the report in the light of all the relevant legal evidence and, on motion of any party to the proceeding, shall enter an order confirming, modifying or rejecting the same and, if confirming or modifying, directing the time within which payment shall be made. If the appraiser's determination of value be confirmed or modified by such order, judgment shall be entered thereon against the corporation and in favor of each objecting stockholder party to the proceeding for the value of his stock so determined. If the appraiser's determination of value be rejected, the court in its discretion (a) may determine the value of the stock of the objecting stockholders in the light of all the relevant legal evidence, in which event judgment shall be entered on such determination as in the case of judgment entered upon an order confirming an appraiser's determination of value, or (b) may remit the proceeding to the appraiser, making such directions with respect to further proceedings as may

be deemed proper. Any judgment for the value of stock entered under this subdivision shall include interest from the date of the stockholders' vote on the action to which objection was made; provided, that if, taking into consideration the price which the corporation may have offered to pay for such stock, the financial statements furnished to the stockholder, and such other circumstances as the court may deem relevant, the court shall find that the action of the stockholder in failing to accept such offer was arbitrary and vexatious or not in good faith, no interest shall be allowed. The payment of any such judgment shall not be deemed to be the declaration or payment of a dividend or a distribution of assets within the meaning of section fifty-eight of the stock corporation law, nor constitute a violation of section six hundred sixty-four of the penal law.

5. The costs and expenses of the proceeding shall be determined by the court and shall be assessed against the corporation; provided, that all or any part of such costs and expenses may be apportioned and assessed as the court may deem equitable against any or all of the objecting stockholder parties to the proceeding to whom the corporation shall have made an offer to pay for the stock if, taking into consideration the value of the stock as determined in the proceeding, the financial statements furnished to such stockholders, and such other circumstances as the court may deem relevant, the court shall find that the action of such stockholders in failing to accept such offer was arbitrary and vexatious or not in good faith. Such expenses shall include reasonable compensation to and the reasonable expenses of the appraiser but shall exclude the fees and expenses of counsel and of experts retained by any party; provided, that if the value of the stock as determined in the proceeding shall materially exceed whatever amount the corporation may have offered to pay therefor, or if no offer shall have been made, the court, in its discretion, may award to any stockholder party to the proceeding such sum as the court may determine to be reasonable compensation to any expert or experts retained by such stockholder in the proceeding if the court shall find the retaining of such expert or experts to have been reasonably necessary.

6. Any stockholder demanding payment for his stock shall have no right to receive any dividends or distributions

payable to holders of such stock of record after the close of business on the day next preceding the date of the stockholders' vote in favor of the action to which such objection was made, and upon such vote shall cease to have any other rights of a stockholder of the corporation with respect to such stock, except the right to receive payment for the value thereof as in this section provided; and no such demand may be withdrawn unless the corporation shall consent thereto. If, however, such demand shall have been withdrawn upon such consent, or if no petition for the appointment of an appraiser to determine the value of the stock of such stockholder shall have been made within the time herein provided, or if a court of competent jurisdiction shall determine that such stockholder is not entitled to the relief by this section provided, or if the action to the taking of which objection was made shall be abandoned or rescinded, the status of such stockholder as a stockholder in the corporation thereupon shall be restored; without prejudice, however, to any corporate proceedings which may have been taken during the interim; provided, that such stockholder shall thereupon be entitled to receive any dividends, distributions or other rights to which he would have been or would have become entitled had he not demanded payment for his stock.

[fol. 4569] 7. The corporation shall not be required to make payment for the stock of any objecting stockholder as in this section provided unless, simultaneously, the certificate or certificates representing such stock shall be surrendered to it, duly indorsed in blank and in proper form for transfer, accompanied by evidence of payment of all requisite stock transfer taxes; and any judgment (red pursuant to this section shall so provide. Upon receipt of such payment, the objecting stockholder shall cease to have any interest in the corporation or its assets by reason of his ownership of the stock so paid for, and such stock may be held or disposed of by the corporation; provided, that if payment for the stock of an objecting stockholder shall have been demanded in consequence of action taken on a merger or consolidation pursuant to sections eighty-five, eighty-six or ninety-one, the shares or other securities of the resulting or surviving corporation into which the shares of the objecting stockholder would have been converted had

no objection been made shall, unless the certificate of merger or consolidation shall otherwise provide, be deemed to have been duly issued in accordance with the terms of such certificate and reacquired by the resulting or surviving corporation, and may be held or disposed of by it free of any preemptive rights of stockholders. The corporation, by resolution of its board of directors, may retire any shares of stock acquired by it upon the payment of a judgment for the value thereof, by filing a certificate as provided in subdivision two hereof for the retirement of shares purchased pursuant to an offer; except, that the affidavits of the president or a vice-president and of the treasurer or a majority of the board of directors, specified in the said subdivision two, relative to the actual value of the assets of the corporation, shall not be required. Upon the filing of such certificate the shares so acquired shall be eliminated from the authorized capital stock or number of shares of the corporation, and the capital of the corporation shall be reduced by an amount equal to the amount of capital represented by the shares so retired.

8. Within twenty days after the last day on which a demand for payment might have been made, each stockholder demanding payment, unless the offer of the corporation to pay therefor shall have been accepted, shall submit his stock certificate or certificates to the corporation for notation thereon of the fact of such demand; and any stockholder who shall fail so to do shall not be entitled to the relief by this section provided unless a court of competent jurisdiction, for good and sufficient cause shown, shall otherwise direct. Upon any subsequent transfers of such stock on the books of the corporation prior to payment by the corporation of the value thereof, as herein provided, the new certificate or certificates issued therefor shall bear a similar notation, together with the name of the original objecting holder of such stock, and, until such payment shall have been made, no transferee of any such stock shall acquire any rights of any character whatsoever by reason thereof except the rights of the original objecting stockholder.

9. In any case where the action with respect to which objection was made shall have been taken with, or authorized by, the consent of stockholders without a meeting, the

actual date upon which the written consent to such action is first obtained from the requisite number of stockholders, or, in case such action shall have been taken pursuant to section eighty-five of the stock corporation law, the date of filing the certificate of ownership as in such section provided, shall for all purposes be deemed to be the date of the stockholders' vote referred to in subdivisions four and six of this section.

[fol. 4570] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 10

New York Stock Exchange

Listing Fee Agreement—Form A.

Agreement made this 13th day of March 1959 by Aluminum Company of America, a corporation duly organized and existing under the laws of the Commonwealth of Pennsylvania (hereinafter called the Company), with the New York Stock Exchange (hereinafter called the Exchange),

Witnesseth:

Whereas, the Company has filed its application for listing upon the Exchange of 355,226 shares of Common Stock; and

Whereas, it is a requirement of the Exchange that, as a condition precedent to the consideration of such application an initial listing fee must accompany the application and, in addition, there must be filed with the Exchange an agreement to pay an annual fee for the continuance of such shares upon the list of the Exchange;

Now, Therefore, in consideration of the Exchange receiving and considering the Company's application for the listing of the above mentioned shares of stock, the Company hereby covenants and agrees as follows:

1. Provided any of the above mentioned 355,226 shares are outstanding and listed on the Exchange when any annual payment is due as hereinafter set forth, the Company will pay to the Exchange each year for a period of fifteen years a continuing fee, with respect to such shares, or any

part thereof, to be calculated as to each payment as provided in the Schedule of Listing Fees hereto annexed and made a part hereof. The first payment is to be made within thirty days after the first anniversary of the date of the original admission of any shares of the issue to dealings on the Exchange (whether or not shares covered by the above mentioned application) and the annual payments thereafter are to be made each within thirty days after the succeeding anniversaries of such admission.

2. Any payments heretofore or hereafter made by the Company to the Exchange in connection with the above mentioned application are hereby declared to be subject [fol. 4571] to the provisions of Schedule hereto annexed and made a part hereof, as the same may be amplified or modified by the foregoing terms of this agreement.

In Witness Whereof, the Company has caused these presents to be executed by its proper officers thereunto duly authorized and its corporate seal to be hereunto affixed, as of the day and year first above written:

Aluminum Company of America, by /s/ Leon E. Hickman, Vice President & General Counsel.

[Seal.]

Attest:

/s/ Alfred M. Hunt, Secretary.

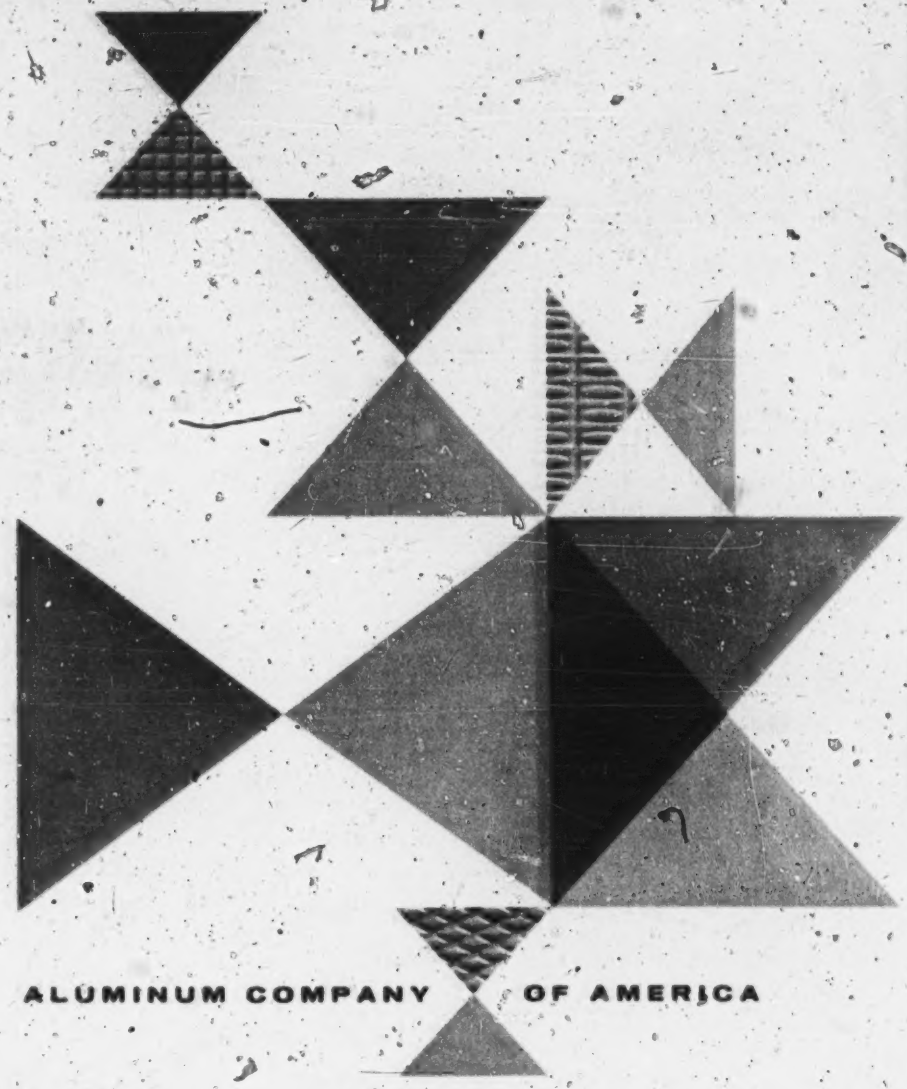
ALCOA ANNUAL REPORT 1958



ALUMINUM COMPANY OF AMERICA

[fol. 4573]

ALUMINUM COMPANY OF AMERICA

Wholly Owned Subsidiaries

ALCOA EXPLORATION COMPANY
Conducts bauxite mining operations in the Dominican Republic.

ALCOA GENERATING CORPORATION
Owns and will operate the power plant now under construction which, when completed, will furnish power to the Warrick works near Evansville, Indiana.

ALCOA INTERNATIONAL, INC.
Sells aluminum products in foreign markets, holds stock of a partially owned related company, and owns ships used for transporting bauxite from Suriname to Trinidad and United States ports.

ALCOA MINERALS INC.
In the process of exploring for bauxite in areas held under concession from the Republic of Panama.

ALCOA OF COSTA RICA, INC.
In the process of exploring for bauxite in Costa Rica.

ALCOA PROPERTIES, INC.
Owns coal properties in Indiana and Kentucky, to supply fuel for power generation at the Warrick works, near Evansville, Indiana, and at a possible future smelter near Sturgis, Kentucky.

ALCOA SECURITIES CORPORATION
Holds stock of certain partially owned affiliated companies, and other securities.

ALCOA SERVICE CORPORATION
Renders building services, and owns certain sales office buildings and other real estate holdings.

ALCOA STEAMSHIP COMPANY, INC.
Owns, charters and operates ships transporting bauxite from Suriname, Trinidad and the Dominican Republic to the United States, and offers commercial service between United States East and Gulf Coast ports and the Caribbean.

ALTON AND SOUTHERN RAILROAD
Owns and operates a belt line and terminal railroad in the vicinity of the East St. Louis, Illinois, works.

ALUMINIO ALCOA (VENEZUELA) S. A.
Holds capital stock of partially owned affiliated companies in Venezuela.

BAUXITE & NORTHERN RAILWAY COMPANY
Owns and operates a railroad in the vicinity of the Bauxite, Arkansas, works.

CEDAR CREEK COMPANY
Operates a railroad switching service at the Bridgeport, Connecticut, works.

CEDARS RAPIDS TRANSMISSION COMPANY, LIMITED
Owns and operates electric transmission lines in Canada, transmitting electric energy for use at the Massena, New York, works.

COLUMBIA RIVER ORCHARDS COMPANY
Operates fruit orchards owned by Aluminum Company of America in the vicinity of the Wenatchee, Washington, works.

LAVACA PIPE LINE COMPANY
Owns and operates gas pipelines to transport natural gas to the Point Comfort, Texas, works.

THE MASSENA TERMINAL RAILROAD COMPANY
Owns and operates a railroad in the vicinity of the Massena, New York, works.

NANTAHALA POWER AND LIGHT COMPANY
Owns and operates hydroelectric power plants and an electric utility system in western North Carolina.

PLEASANT HILLS WATER COMPANY
Supplies water for public and private use in the town of Riverdale, Iowa, near the Davenport, Iowa, works.

POINT COMFORT & NORTHERN RAILWAY COMPANY
Owns and operates a railroad in the vicinity of the Point Comfort, Texas, works.

POINT COMFORT WATER COMPANY
Owns the supply of fresh water for the refining plant at the Point Comfort, Texas, works.

ROCKDALE, SANDOW & SOUTHERN RAILROAD COMPANY
Owns and operates a railroad in the vicinity of the Rockdale, Texas, works.

THE ST. LAWRENCE RIVER POWER COMPANY
Owns and operates electric transmission lines and a water distribution system at the Massena, New York, works.

SURINAME ALUMINUM COMPANY
Conducts bauxite mining operations on lands held under concession from the Suriname government; and is in the process of carrying out the power and smelting undertakings designated in the Brokopondo Agreement.

SURINAME TRANSPORT COMPANY, N. V.
Owns floating equipment used for mine dredging and ship towing in Suriname.

TAPOCO, INC.
Owns and operates (a) the Tallassee Project, a federally licensed hydroelectric development consisting of four power plants in North Carolina and Tennessee, to furnish power to the Alcoa, Tennessee, works, and (b) water distribution systems to supply water for that works and surrounding communities.

WEAR-EVER ALUMINUM, INC.
Sells Wear-Ever aluminum cooking utensils, Kensington giftware, Cutco cutlery, Westmorland sterling and Alcoa Wrap.

WEAR-EVER INTERNATIONAL, INC.
Sells Wear-Ever aluminum cooking utensils and Cutco cutlery in Latin America.

YADKIN, INC.
Owns and operates the Yadkin Project, a federally licensed hydroelectric development consisting of four power plants (three in operation and one to be constructed) in North Carolina, to furnish power to the Badin, North Carolina, works.

ANNUAL MEETING

The annual meeting of shareholders of Aluminum Company of America will be held on Thursday, April 16, 1959, at 10:00 a.m., E.S.T., in the Pittsburgh Room, Penn-Sheraton Hotel, Pittsburgh, Pa.

Officers

I. W. Wilson	*Chairman of the Board*
Roy A. Hunt	*Chairman of the Executive Committee*
Frank L. Magee	*President*
N. R. Althauser	*Vice President and Controller*
M. M. Anderson	*Vice President in Charge of Personnel and Industrial Relations*
Frederick J. Closz	*Vice President in Charge of Sales Development and Commercial Research Divisions*
Ralph V. Davies	*Vice President in Charge of Sales*
H. C. Erskine	*Vice President in Charge of Smelting and Fabricating Operations*
*Lewis P. Favorite	*Vice President in Charge of Product Sales and Distribution*
B. J. Fletcher	*Vice President, General Manager of Engineering*
J. P. Haight	*Vice President in Charge of Engineering and Purchasing*
Arthur P. Hall	*Vice President in Charge of Public Relations and Advertising*
Leon E. Hickman	*Vice President and General Counsel*
R. O. Keefer	*Vice President, General Purchasing Agent*
Lawrence Litchfield, Jr.	*Vice President in Charge of Raw Materials and Refining Divisions*
Robert B. McKee	*Vice President in Charge of Sales Offices and Direct Selling*
Edward B. Wilber	*Vice President and Treasurer*
*D. Wilmot	*Vice President in Charge of Product Sales and Distribution*
Alfred M. Hunt	*Secretary*

*Effective February 1, 1959, Mr. Favorite was elected vice president, succeeding Mr. Wilmot, who retired.

Assistant Officers

C. C. Conner	*Assistant Secretary*
R. E. Coulter	*Assistant Treasurer*
Harry Flynn	*Assistant General Counsel*
S. T. Gustina	*Assistant Controller*
C. W. Head	*Assistant Treasurer*
Matt. W. Stanley	*Assistant Treasurer*
W. K. Unverzagt	*Assistant General Counsel*

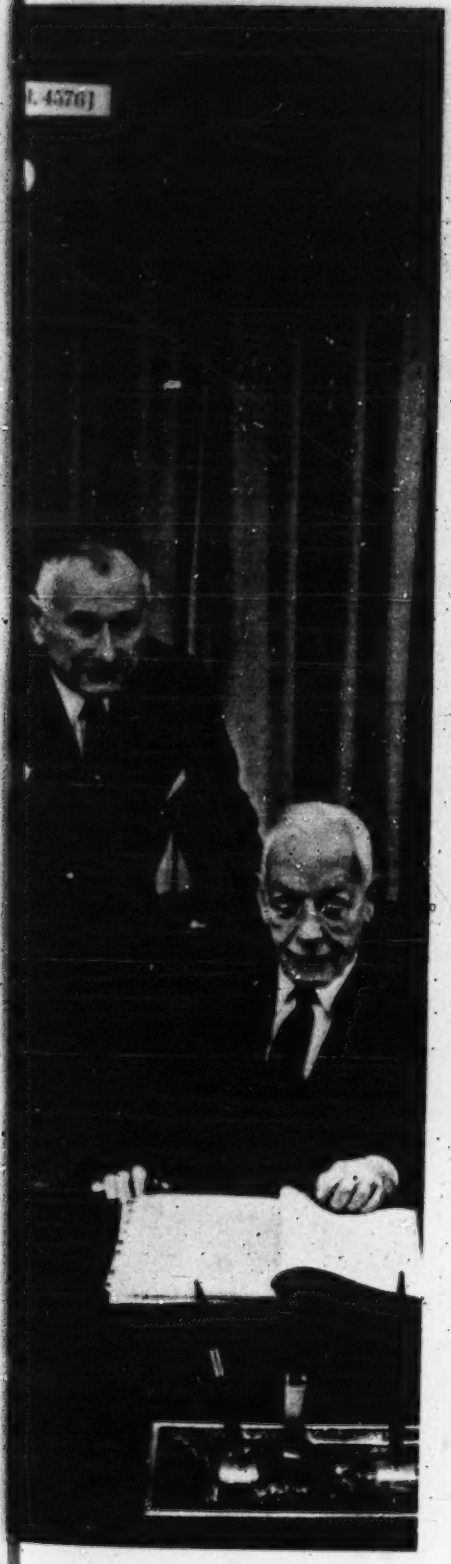
Common Stock Equity	621,149,965	604,540,293
Equity Per Share of Common Stock	30.09	29.34



To the Shareholders of ALCOA

Alcoa's sales and earnings dropped substantially in 1958, reflecting generally reduced activity in the national economy. Although an upward trend in aluminum consumption was noticeable over the course of the year, the company's smelters and fabricating facilities operated well below capacity.

In the aluminum industry throughout the world, surplus productive capacity has been a significant problem. Intense competition, particularly in the area of prices, prevailed throughout the year. Late in March, when the price of aluminum dropped on the world market, your company met this situation by reducing the price of primary aluminum ingot from 26 cents to 24 cents per pound, effective April 1. By August 1, conditions were such that part of this reduction could be restored, and Alcoa led U. S. producers with an increase of seven-tenths of a cent per pound. This price increment, however, only partially offset wage increases under existing labor agreements and other rising costs.

Although the existence of surplus productive capacity throughout our industry caused many problems during this period, it serves as an essential element of future growth. To stimulate the expansion of aluminum markets, the company placed added emphasis on its research and development program in 1958. At the same time, an aggressive sales and advertising campaign was conducted to promote new uses and to increase the sale of aluminum for its many present applications. The success of these efforts is indicated by an increase in the use of aluminum per unit of output of many durable goods products in a year when production of such products was sharply curtailed.

A number of market developments of 1958 point toward great opportunities for the growth of aluminum usage in the years ahead. One outstanding example is the building and construction industry, where developments in the field of residential construction are especially promising. Significant progress has also been made in automobile, highway, packaging and electrical applications.

Throughout the company's operations, major emphasis has been placed on cost reduction and increased production efficiency. As a result, important savings have been realized in man power and operating expenses. These improvements were made possible only by a united effort on the part of all Alcoa employees.

On March 25, 1959, the shareholders of Rome Cable Corporation will vote on a proposal made by Alcoa to acquire the assets of Rome in exchange for 355,226 shares of common stock of Alcoa and the assumption by Alcoa of the obligations of Rome. The proposal has been approved by the Board of Directors of Rome. If the sale is approved by its shareholders, the assets of Rome will be transferred to Alcoa as of March 31, 1959. Rome Cable Corporation is a successful and respected wire and cable company (largely copper) and its consolidation with Alcoa will make available to Alcoa facilities and personnel needed to expand our aluminum conductor markets as well as greatly extending the line of products offered to the trade through a single organization.

In submitting this report, the directors and officers take this opportunity to gratefully acknowledge the many contributions made by the men and women of Alcoa who have worked together so effectively during this difficult period. Their loyalty and cooperation in carrying on the affairs of this enterprise are a firm basis for Alcoa's future success.

J. W. WILSON, *Chairman of the Board*
FRANK L. MAGEE, *President*

1501 Alcoa Building
Pittsburgh 19, Pennsylvania
March 1, 1959

Pittsburgh's John J. Kane Hospital, completed in 1956, incorporates nearly two million pounds of Alcoa aluminum in functional and decorative applications.

MARKETS

Demand for aluminum remained at reduced levels during 1958, reflecting the continued effect of the general business recession. In an effort to offset this market condition, the company placed heavy emphasis on an increasingly aggressive sales effort coupled with an intensified research and development program.

BUILDING AND CONSTRUCTION. One of the largest markets for aluminum again was the building and construction industry. Aluminum-faced buildings of the monumental type increased in number during 1958. Two outstanding examples where Alcoa aluminum was specified were the 47-story Time-Rockefeller Building and the 60-story Chase Manhattan Building, both in New York City.

A promising architectural development of the year was the trend toward aluminum in residential construction, which was keynoted by the announcement of a complete line of manufactured aluminum dwellings by National Homes Corporation. The new houses were inspired by Alcoa's widely publicized Care-Free Home described in last year's report and were designed through cooperative research and engineering by Alcoa and National Homes Corporation. Aluminum was also prominently featured in the 1958 research homes sponsored by the National Association of Home Builders.

TRANSPORTATION INDUSTRY. Another leading market for aluminum was transportation, with automotive applications remaining the largest single segment. Aluminum applications in 1958 model passenger automobiles increased more than 16 per cent over 1957 models and reached an average of 37.52 pounds per car for the year.

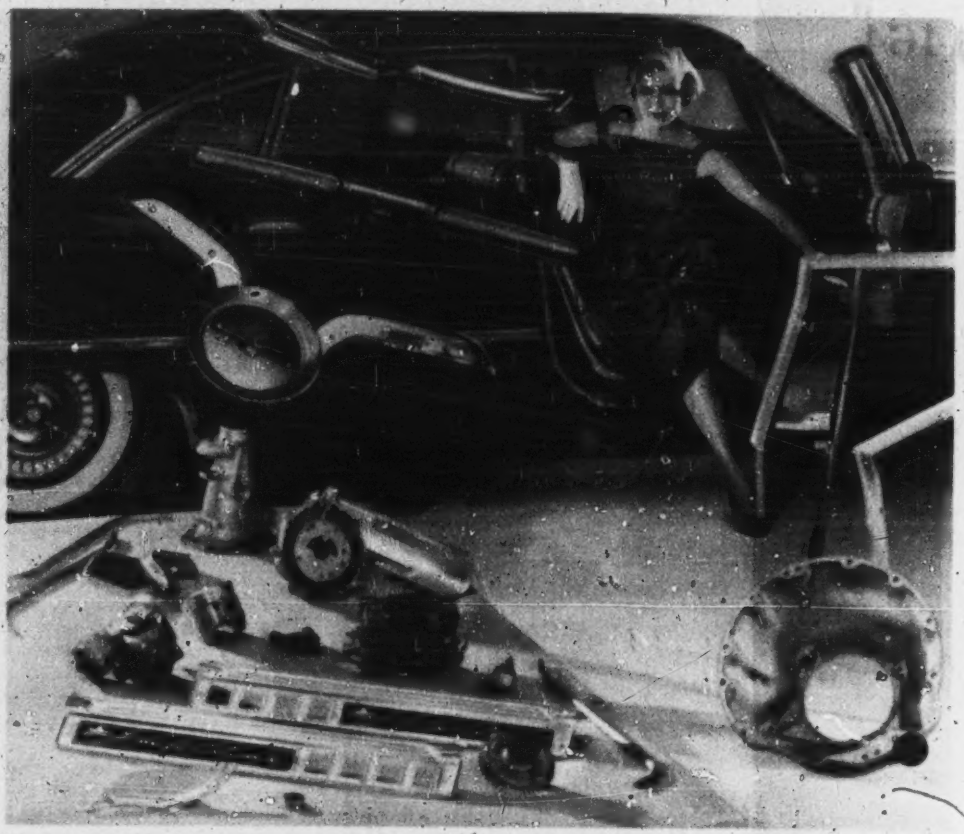
It now appears that the automotive industry is on the threshold of a development that should have an important effect on the use of aluminum. An all-aluminum engine is reported to be imminent, and is expected to appear first on some 1959 models.

While aircraft production continues to consume large quantities of aluminum, missiles have also become a promising new field of application. Typical aluminum missile parts now in use or under consideration are skins, fuel bodies, structural and mechanical parts, launching devices and ground handling equipment.

STRUCTURAL APPLICATIONS. Important progress was made in structural applications for aluminum during 1958. In September, the first welded aluminum girder type highway bridge was dedicated at Des Moines, Iowa, a result of a project jointly sponsored by the State of Iowa, Aluminum Company of America

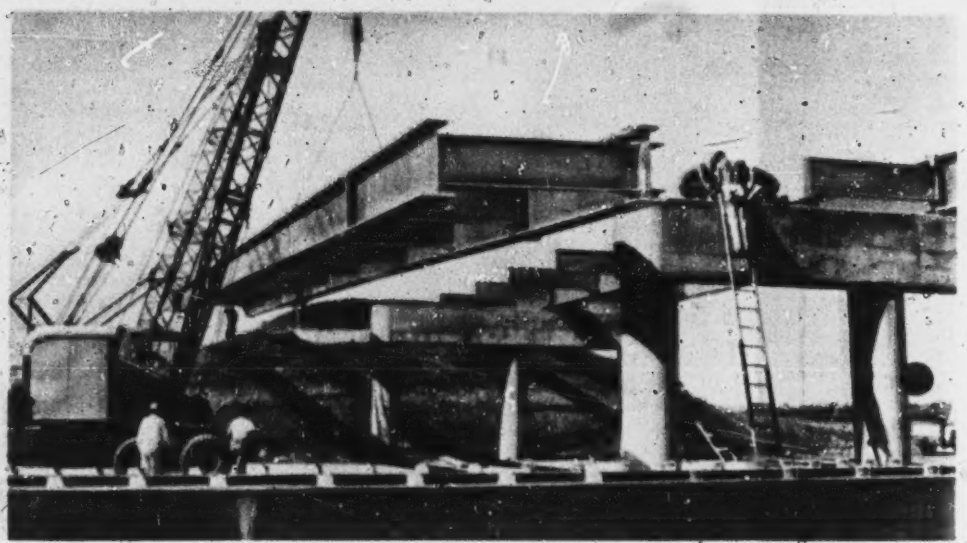
The Chateau model of National Homes Corporation's new Viking line employs 4,000 pounds of aluminum. The Viking line was inspired by Alcoa's Care-Free Home.

[fol. 4579]



Nearly 100 pounds of aluminum are used in this 1958 Chrysler. Average for all 1958 passenger automobiles was 27.72 pounds per car.

This aluminum highway bridge, constructed in the State of Iowa during 1958, represents a vast new market for aluminum.



[fol. 4580]

and two other major aluminum producers. Another aluminum bridge which Alcoa helped to sponsor was designed and built by Fairchild Engine and Airplane Corporation, and was tested by Lehigh University's Department of Civil Engineering. The Fairchild bridge incorporates proven aircraft principles, can be mass-produced in sections and is quickly and easily transported and assembled. Since the nation's highway construction program will include some 60 to 70 thousand bridges, these developments may help to create a large new market for aluminum.

Another significant development took place in the electric utility field, when Public Service Electric and Gas Company, Newark, N. J., announced that it intended to use 60 aluminum towers on an 11-mile power transmission line. This structural application of aluminum in the electrical industry is the latest in a series introduced under the leadership of Alcoa. It further extends the use of the metal in a field that has long been an important market. Aluminum is a leading material for use in overhead transmission, primary and secondary distribution, busway systems, and light and heavy industrial bus runs. It is also used in electrical substations, utility pole crossarms and the upper "hot" part of transmission towers.

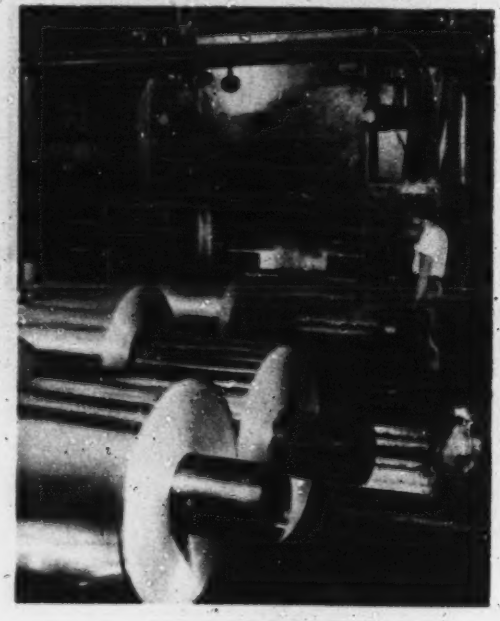
ELECTRICAL EQUIPMENT. Progress in the electrical equipment industry was less spectacular, but equally promising. New developments in coil winding now make it possible for electrical manufacturers to realize substantial savings by using aluminum sheet and foil as strip windings in a wide range of applications from large transformers to miniature radio cells. Cast aluminum rotors and stators were employed in most of the 50 million fractional horsepower motors produced in this country during 1958.

HIGHWAY APPLICATIONS. During 1958, the use of aluminum in bridge railings, signs, fences, gates and lighting equipment continued to be an important field of application. This use of aluminum is also expected to grow as the nation's highway construction program continues.

CONTAINERS AND PACKAGING. As in past years, aluminum had a significant part in the expanding market for containers and packaging. Foil containers are becoming increasingly popular, and the use of aluminum for this application continued to grow.

Aluminum's role in the jet age is illustrated by the fact that nearly 50 tons of the light metal are used in the new Boeing 707 Stratoliner.

A modern foil mill at Davenport, Iowa, works—part of Alcoa's new facilities built to meet the increasing demand for foil in home and industry.



[fol. 4581]

RESEARCH AND DEVELOPMENT

Throughout 1958, Alcoa continued to maintain its industry-wide leadership in research and development. To strengthen this position still further, the company reorganized and extended its network of technical committees and, at the same time, placed them under more unified direction. These steps are expected to improve the effectiveness of the company's research and development program, and to provide even greater opportunity for outstanding accomplishment.

PROGRESS ON NEW RESEARCH CENTER. Alcoa is continuing with its plans, first reported in 1957, to provide for present and future expansion of its research and development facilities. The location to be developed is a 2,300-acre site at Merwin, Pa., a short distance from the present headquarters of Alcoa Research Laboratories at New Kensington, Pa. Survey work has begun, and preliminary building plans are being developed.

FACILITIES ADDED. In order to take advantage of the market possibilities offered by electrical equipment, the company purchased facilities of the Transformer Division of Automation Instruments, Denver, Colo., and installed them at Alcoa Research Laboratories. These facilities will be used to develop insulating coatings and winding techniques for the production of coils from aluminum strip and foil.

NEW DEVELOPMENTS. Several new products and processes introduced in 1958 offer considerable promise. One development of special significance is a new high-strength, high-modulus alloy for aircraft, containing lithium as a principal alloying constituent. Known as Alloy X-2020, this new product will main-

This huge ingot, weighing 21,000 pounds, was cast at Lafayette, Ind., works for fabrication into missile components by an Alcoa customer.

[fol. 4582]

tain high strength up to 400° F, thus extending by more than 100° F the usefulness of aluminum in the construction of supersonic aircraft.

Another noteworthy development of the year was a new line of aluminum architectural products for roofing, siding, fence panels and garage doors. Finished in a variety of baked alkyd enamel colors, the new product is sold under the trade name, Alumalure, and is available in either flat or coiled sheet.

After several years of development work, Alcoa is now offering a complete line of aluminum rain-carrying equipment (gutters, downspouts and related equipment) for residential use. These architectural accessories have been designed for ease of installation, serviceability and unusual aesthetic appeal.

A complete new line of aluminum rain-carrying equipment for residential use was announced by Alcoa in 1958.

Alcoa's development of high-strength alloys and materials for high temperature ceramics has greatly broadened the market possibilities for the company's products in the field of missiles and rockets.

ADVERTISING AND SALES PROMOTION HIGHLIGHTS

Alcoa again conducted an aggressive, imaginative advertising and sales promotion campaign throughout the year. The company's FORECAST program of stimulating new uses for aluminum was continued with the announcement of five new design creations.

In response to the urgent need for 500,000 new classrooms in America's school system, Alcoa financed the preparation of an unusual book entitled *SCHOOLHOUSE: What to Do When Your Neighborhood Needs a School.* Now available in bookstores throughout the country, the publication was sponsored by Alcoa as a public service. Public response to the new book has been enthusiastic.

Alcoa's residential housing program for 1958 involved the largest amount of national and local publicity ever devoted to this activity. Part of this program was a follow-up of the 1957 Care-free Home campaign and was concentrated on new residential developments announced during 1958 (see page 5).

During 1958, the company continued its unusual program of promoting Alcoa Wrap household foil by including samples in metropolitan newspapers. In this manner, some 3,000 miles of foil were distributed to nearly 9 million families during 1958. Sales of Alcoa Wrap increased significantly in every area where the program was used.

Supporting all of Alcoa's promotional programs, the *Alcoa Theatre* continued to give top entertainment to a nationwide audience through its half-hour TV dramatic series. Planned for wide audience appeal, each *Alcoa Theatre* production used three minutes for its commercial messages. Subjects for these messages were selected from the company's customer support, Alcoa Wrap and institutional programs.

Camera crew films scene from Alcoa's latest movie entitled "A Product of the Imagination." Film tells story of aluminum's development and many uses.

Company executives examine plans for Alcoa Market-Maker Promotion, designed to create new uses for aluminum by intensive advertising in seven major markets.

[fol. 4584]

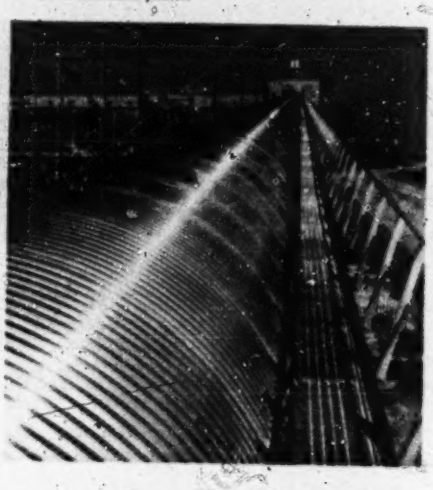
FACILITIES

While the company's sales and research divisions were carrying out a vigorous campaign to promote the sale and broaden the use of aluminum, Alcoa's manufacturing locations worked effectively to cut production costs, prolong the life of existing equipment and generally increase the production efficiency of all facilities.

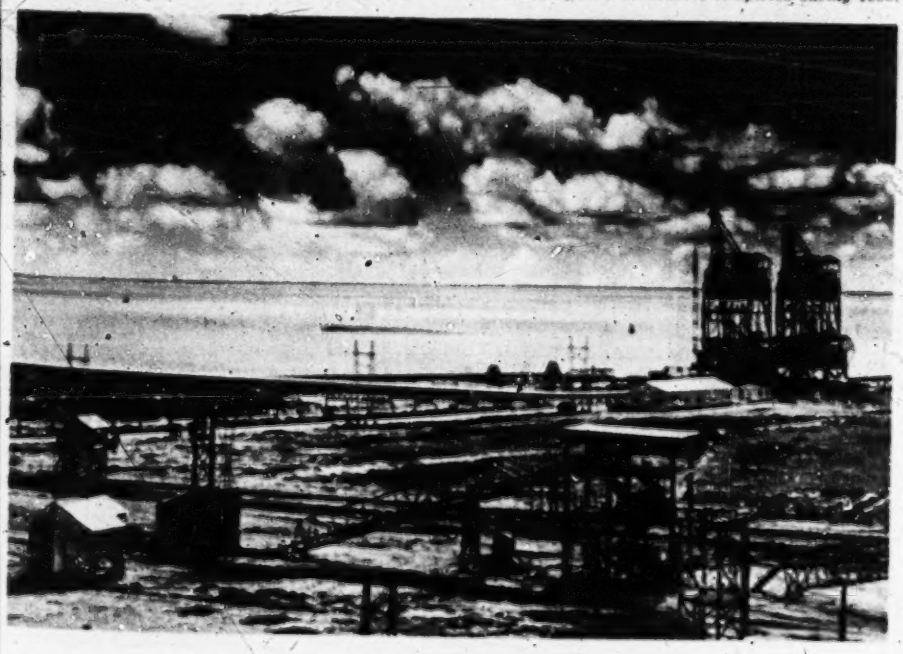
Significant savings in man power and operating expenses were achieved as a result of careful auditing of production activities, planned simplification of paperwork, establishment of data processing equipment and rearrangement of work patterns for increased efficiency. Close control was exercised over the replacement of equipment, and increased emphasis was placed on prolonging the operational life of existing equipment.

Production facilities generally operated at substantially reduced volume throughout 1958. Total production of primary aluminum was 520,000 tons compared with 712,000 tons in 1957.

New bauxite conveyor system transports ore from dock to storage area at recently completed Point Comfort alumina plant.



Dock and related facilities at Alcoa's Point Comfort, Tex., alumina plant, which were completed during 1958.



View of new alumina plant which is being constructed at Point Comfort, Tex

Raw materials—refining

Significant progress was made during 1958 in increasing the company's available supply of raw materials. The acquisition of new or extended bauxite concessions in a number of foreign locations is described under "Foreign Activities."

In addition, Alcoa has continued to provide for new sources of electric energy by continued exploration for natural gas and oil deposits, and by acquiring extensive new reserves of coal. In southern Indiana, Alcoa completed purchase of coal reserves and land properties for use at Warrick works power plant, and provided facilities for mining, processing and transporting the coal, through contractual arrangements with Peabody Coal Company.

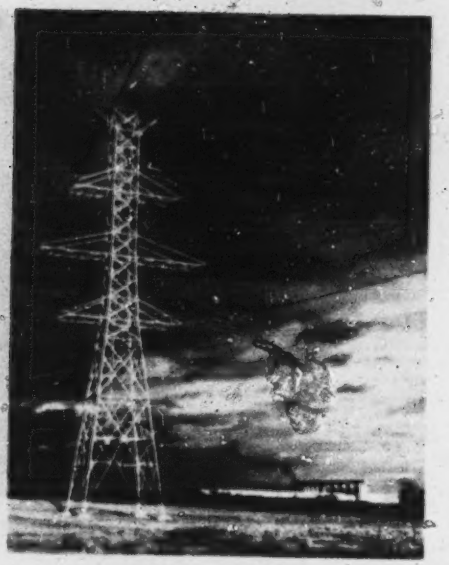
To provide facilities capable of refining Caribbean bauxite and to increase the supply of alumina for Alcoa smelters in the Gulf Coast area, the company continued construction of a new alumina plant at Point Comfort, Tex. Shipment of ore to this plant will be facilitated by a 36-foot deep channel from the Gulf of Mexico to Matagorda Bay. The channel was authorized by Congress in 1958, and is to be constructed by the U.S. Corps of Engineers, subject to appropriation of the necessary funds.

[fol. 4586]

Smelting

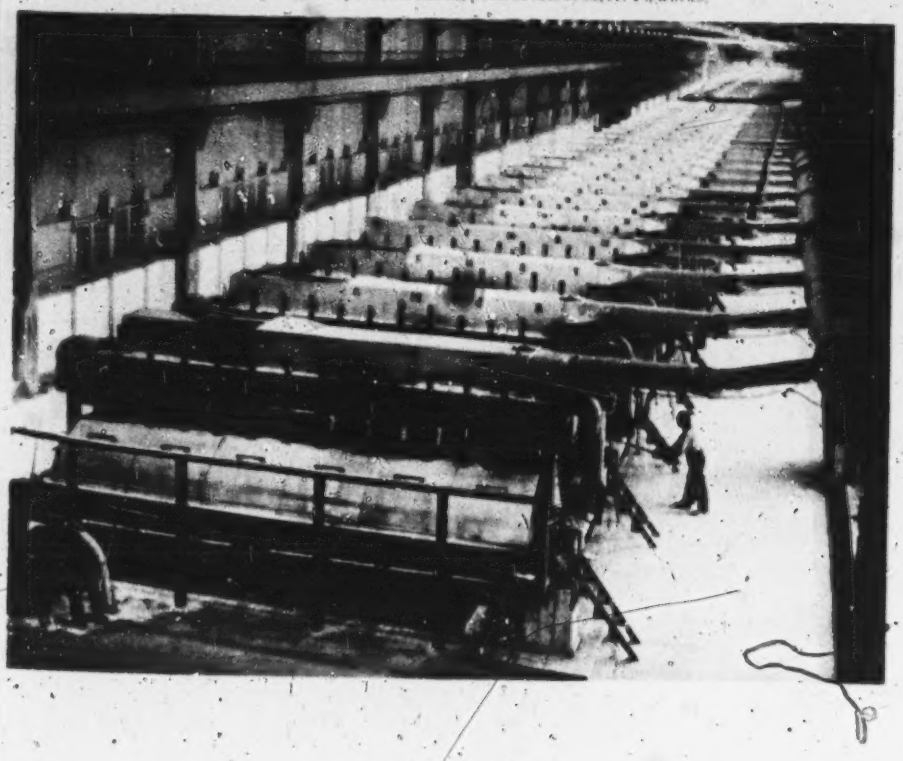
Alcoa's smelting activities during 1958 were conducted with constant emphasis on modernization of equipment and improvement in production practices at all operating locations. Because of the company's confidence that the demand for aluminum would continue to grow in years to come, none of the smelting division's expansion plans were canceled. Instead, construction programs were slowed down and completion dates were extended.

A concerted effort to ensure a long-range power supply at all Alcoa smelters was continued, and considerable progress was made. The company was

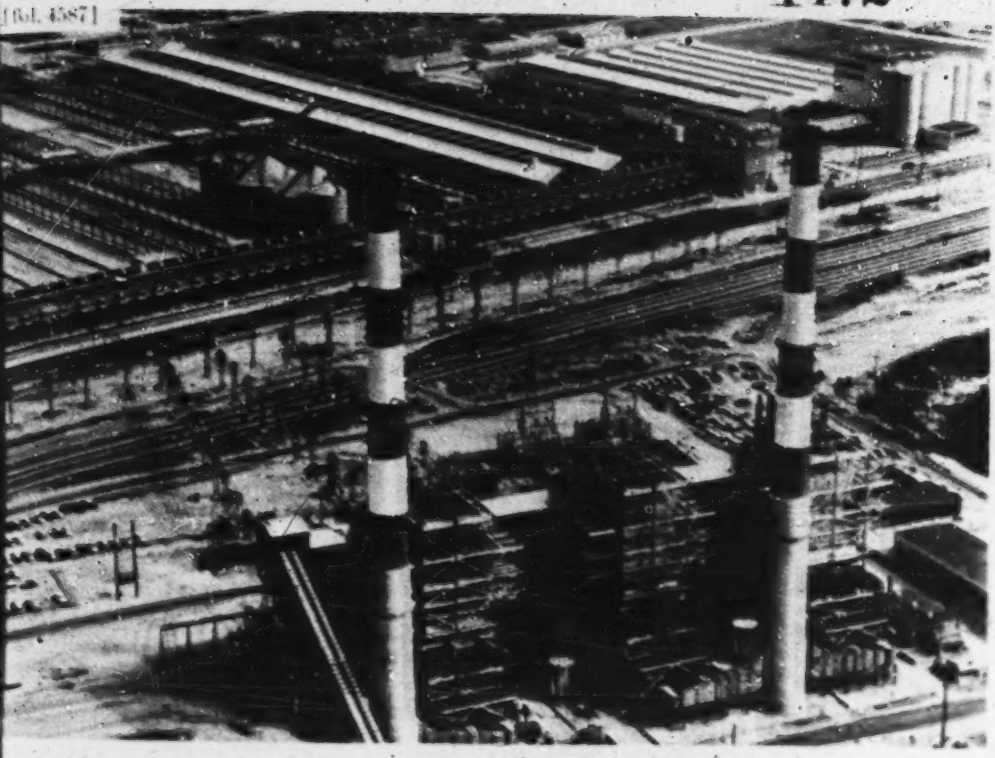


A vast network of power lines transmits electricity from the St. Lawrence Project to Alcoa's Massena, N. Y., works.

This new potline was one of two placed in operation during 1958 at Massena, N. Y., works.



[Vol. 4587]



Construction was essentially completed on the power plant and one potline at Warrick's works near Evansville, Ind.

granted a 50-year license by the Federal Power Commission on a new dam at Tuckertown, N. C., and three existing dams on the Yadkin River — all to be known as the Yadkin Project. This hydroelectric development will serve as the power source for operations at the Badin, N. C., works.

At Massena, N. Y., two of three new potlines were completed and placed in operation during the year. With the production of aluminum from these new potlines, Alcoa became the largest industrial user of power from the St. Lawrence Project of the Power Authority of the State of New York. These facilities were built to replace potlines using power from Alcoa's own generating station which will become permanently inoperable with the completion of the St. Lawrence Seaway and Power Project.

A new potline at the Point Comfort, Tex., smelter, was essentially completed. When placed in production, the new line will increase the production capacity of the Point Comfort smelter to 140,000 tons per year.

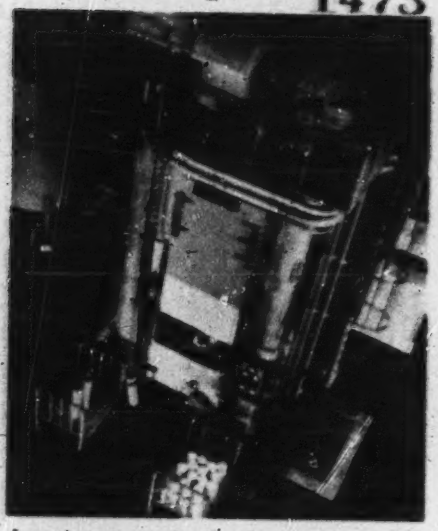
At Warrick works, construction was continued on the new smelter, although at a reduced rate. The Warrick works power station is scheduled for completion early in 1960.

[fol. 4588]

Fabricating

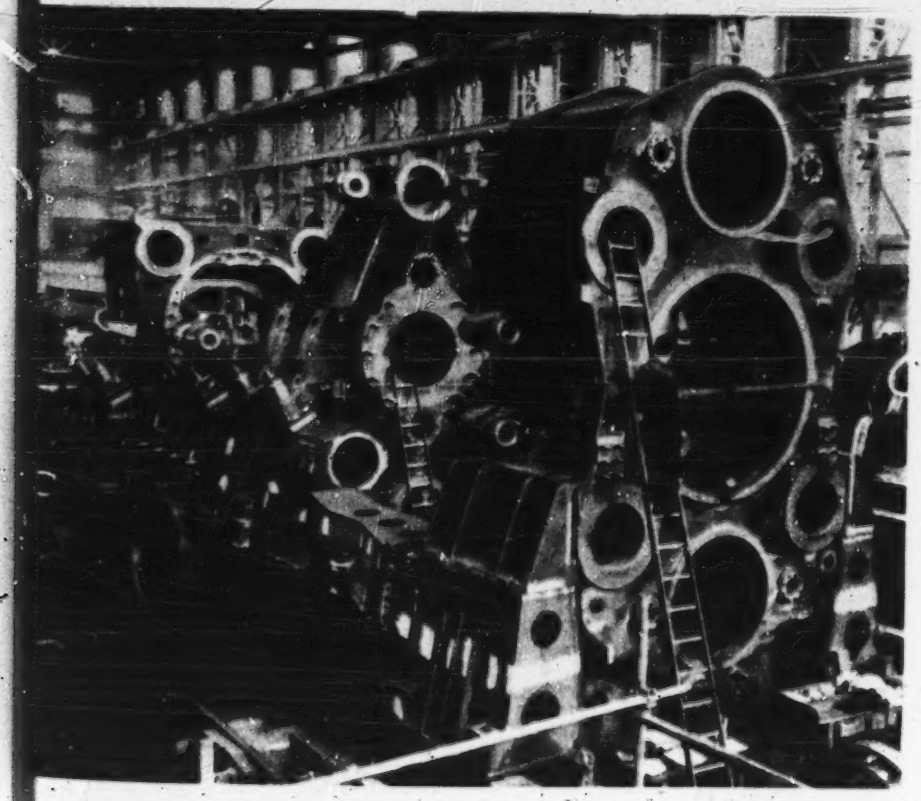
In response to the growing demand for foil packaging materials, the company installed an additional foil laminator at the Davenport, Iowa, works. This equipment laminates foil to paper for use in the packaging and building industries.

A 2,500-ton vertical impact extrusion press was installed and began production at Cressona, Pa. This new press produces one-piece, seamless semi-hollow or solid shapes having forged bases and one or more extruded walls. Products of this type are used widely

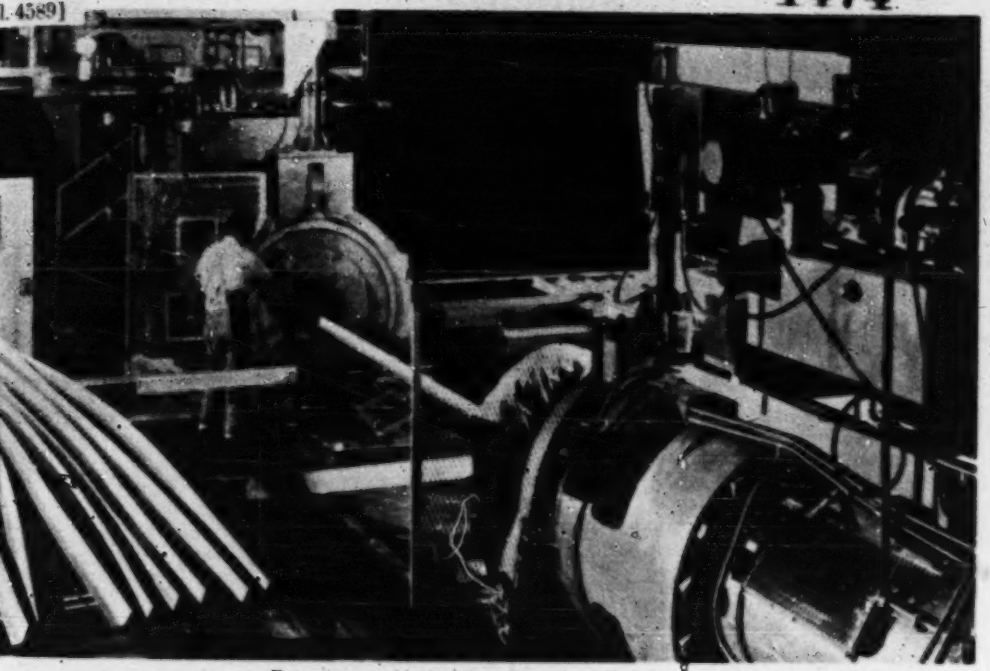


Large impact extrusions for aircraft, automotive and electrical industries are fabricated on this new press at Cressona, Pa., works.

New Alcoa-owned 14,000-ton extrusion press for Lafayette, Ind., works is assembled in manufacturer's plant. New press is twin to Air Force press at Lafayette.



1-4589]



Extrusions produced at Vernon works in Los Angeles, Calif., are straightened on new 750,000-lb stretcher. Stretching relieves stresses which develop during fabrication.

by the aircraft, appliance and electronics industries.

The first shipment of parts for a 14,000-ton Alcoa-owned extrusion press was received at the Lafayette, Ind., works. This press is to be a companion to the Air Force-owned press already in operation there, and is being built to meet an increasing demand for large, high-strength aluminum alloy extrusions, primarily in the aircraft and missiles fields. Construction of auxiliary equipment continued in 1958, and the press foundation has been completed.

At Richmond, Ind., facilities were installed for making a new screw-on cap for baby food jars developed by Alcoa to meet an urgent market need. This development, which also involved the fabrication of filling and capping equipment for use in customers' plants, is expected to offer wide market possibilities.

FOREIGN ACTIVITIES

In 1958, Alcoa broadened the scope of its foreign activities and made a number of organizational changes designed to take advantage of the promising opportunities offered by foreign markets.

NEW ORGANIZATIONAL PROVISIONS. To promote and supervise the development of these activities, a new international division of Alcoa was established and the operations of Alcoa International, Inc., a subsidiary of Alcoa, were expanded. These organizations are designed to develop foreign markets by the direct sale of Alcoa products, by the licensing of foreign companies to manufacture aluminum products with Alcoa technical advice, or by investment in overseas manufacturing facilities.

EXPLORATION AND MINING ACTIVITIES. In a series of steps taken to prepare for the anticipated growth of markets, the company has entered into agreements with foreign governments assuring bauxite mining concessions in a number of foreign locations. Exploration activities are now being carried on.

Through an agreement with the Government of [illegible] name signed in 1958, Suriname Aluminum Company (Suralco), a wholly owned subsidiary, extended its rights for additional bauxite concessions in that country and initiated a program to build a hydroelectric development and smelting facilities there. This agreement also provides for the eventual construction of a bauxite refining plant in Suriname. Preliminary engineering investigations on the over all project, known as the Brokopondo Development, are under way. A description of the Brokopondo Agreement was given in the 1957 Annual Report.

During the year, Alcoa contracted for the sale of [illegible],000,000 tons of Suriname bauxite and its shipment by Alcoa Steamship Company, Inc., to government stockpiles in the United States.

Other Alcoa explorations and mining prospects are being carried out in Costa Rica, Panama and the Dominican Republic. In Costa Rica, exploratory drilling operations resulted in the development of substantial new reserves of bauxite, while the results of exploration in Panama have proved promising enough to warrant the negotiation of a government contract establishing Alcoa's mining rights in that country. Construction of mining and dock facilities at Cabo Rojo, Dominican Republic, were completed during the year, and mining operations were begun.

MARKETING ACTIVITIES. Alcomex, S. A., a subsidiary company manufacturing and selling extruded and tubular products in Mexico, continued to increase its marketing activities and to improve its operating and manufacturing efficiency during the year 1958.

Alcoa has negotiated with the Furukawa Electric Company of Japan to establish a jointly owned fabricating company to be known as Furukawa Aluminum Company (Furalco) to make aluminum sheet, extrusions and castings. The arrangement provides for Alcoa's obtaining one-third of the new company's capital stock and providing technical advice on a royalty basis. Approval of the proposal by the Japanese government is required before the negotiations can be concluded.

In November, the directors of The British Aluminium Company Limited, offered to sell 5[illegible] million shares of authorized, but as yet unissued, common stock of their company to Alcoa in order to obtain capital funds for future expansion and market development as well as the technical and marketing assistance of Alcoa. This offer was accepted by your management, subject to approval of the British Treasury. Before the purchase was completed, however, control of British Aluminium changed hands, and Alcoa thereupon withdrew, believing this course of action to be in the best interests of its shareholders.

Dock facilities at Cabo Rojo, Dominican Republic, which will be used for shipment of Dominican bauxite to the United States.

ORGANIZATIONAL CHANGES

At a meeting of the board of directors of Aluminum Company of America held April 17, 1958, four new vice presidents were elected. They are N. R. Althauser, controller; F. J. Close, in charge of sales development and commercial research divisions; B. J. Fletcher, general manager of engineering; R. O. Keefer, general purchasing agent.

Upon the retirement of D. Wilmot, vice president in charge of product sales and distribution, on February 1, 1959, Lewis P. Favorite was elected as his successor. Mr. Favorite had been manager of product sales.

John S. Harrison, formerly assistant to the vice president in charge of personnel and industrial relations, was named general manager, personnel, on January 3, 1958.

The name of The Aluminum Cooking Utensil Company, Inc., a wholly owned subsidiary of Alcoa, was changed to Wear-Ever Aluminum, Inc., on January 22, 1958. Robert L. Becker, president of this Alcoa subsidiary, was also elected president of Wear-Ever International, Inc., effective December 31, 1958, succeeding Errett M. Grable, who retired.

L. B. Kuhns, formerly assistant chief engineer of Alcoa, became chief engineer on February 1, 1958.

John L. Fleming, formerly assistant director of public relations, was named general manager of public relations on February 1, 1958.

Harry L. Smith, Jr., vice president in charge of sales development and commercial research divisions, retired June 30, 1958.

In a reorganization of Alcoa's foreign operations, John M. Mitchell, formerly president of Esko-Alcoa Containers Inc., was elected president of Alcoa International, Inc., and became general manager of the new international division of Aluminum Company of America on July 1, 1958.

Smelting operations at Badin, N. C., were transferred to Alcoa from Carolina Aluminum Company, a wholly owned subsidiary, effective July 1, 1958. Power generating and transmission facilities serving the Badin smelter are retained in Carolina Aluminum Company, renamed Yadkin, Inc.

The board of directors of Alton and Southern Railroad, a wholly owned subsidiary of Alcoa, elected James Davies to the position of chairman of the board, effective August 1, 1958. He was succeeded as president by Robert K. Heineman, formerly Alcoa's director of industrial relations, and vice president of the subsidiary since January 1, 1958.

Upon the retirement of Herman E. Bakken, vice president and general manager of the refining division on October 1, 1958, the refining division was placed under the supervision of Lawrence Litchfield, Jr., formerly vice president and general manager of the mining division, whose new title is vice president in charge of raw materials and refining divisions. At the same time, J. R. Fox was named general manager of the refining division and G. W. Streepey was made general manager of the raw materials division.

In a move to reorganize and broaden the scope of the company's research and development programs, Alcoa's internal network of technical advisory committees was combined under more unified direction. T. W. Bossert, former chief metallurgist for Alcoa, became the new, full-time chairman of the company's expanded research and development committee on November 12, 1958. As committee chairman, Mr. Bossert succeeds G. D. Welty, manager of engineering sales for Alcoa, who retired November 1, 1958. Concurrent with the new appointment, J. H. Alden was named the first full-time secretary of the committee and J. W. Hood was appointed to the position of chief metallurgist of the company.

PERSONNEL AND INDUSTRIAL RELATIONS

For all Alcoa personnel, 1958 was a year of intense effort to meet the problems resulting from reduced business activity and increased competition. Efforts to improve costs and organizational effectiveness received a cooperative and constructive response at all levels.

Conferences on creative thinking techniques, designed to sharpen problem-solving skills and generate new ideas, were started at several additional works during 1958 and are producing financial savings. Other management development efforts emphasized job improvement through coaching and regular performance reviews. Education and training programs stressed cost improvement and the need for more attention to employee communication.

The relatively few people added to the company during the year were carefully selected and placed. Recruitment of college graduates was concentrated primarily on research and sales personnel.

Alcoa's interest in safety and insistence on safe practices again were recognized by the National Safety Council, which presented awards to several of our plants for reduced injury rates during 1958.

The Alcoa Savings Plan For Salaried Employees has provided an incentive and an effective way for such employees to acquire a stock interest in the company as well as a convenient method to save. Under its provisions, salaried employees are permitted to invest up to a maximum of 8 per cent of their salary in the savings plan. Participants may invest either 100 per cent in U. S. Savings Bonds or 50 per cent in such bonds and 50 per cent in Alcoa common stock. The company contributes an amount equal to 50 per cent of the participant's savings, which is invested in Alcoa common stock. The plan was approved at the shareholders annual meeting on April 17, 1958. As of December 31, 1958, approximately 83 per cent of the eligible employees were participating.

Alcoa's three-year agreements with its major unions which were entered into in 1956 provided for additional wage and fringe benefit improvements in 1958. These labor agreements expire on July 31, 1959. There were no major strikes or work stoppages during the year, and our employee and union relations showed the results of effective communication and improved understanding of employees' interests and management objectives and responsibilities.

HONORS

An award for chemical engineering achievement was presented in January to Alcoa by *Chemical Engineering* magazine, for meritorious contributions to the extractive metallurgy of the Atomic Age.

Broadcasting industry's top honor for public service in the highway safety field — the Alfred P. Sloan Award — was presented to Alcoa on May 6 in recognition of the *Alcoa Hour* television program, "No License to Kill."

R. O. Keefer, vice president and general purchasing agent, was awarded the J. Shipman Gold Medal on May 13 by the National Association of Purchasing Agents for his achievements in standardization.

Howard J. Rowe, chief metallurgist of Alcoa's fabricating division, was awarded the William H. McFadden Gold Medal of the American Foundrymen's Society on May 19 for his "outstanding contributions to the society and the light metals branch of the casting industry."

I. W. Wilson, chairman of the board of Alcoa, was awarded an honorary degree of Doctor of Commercial Science from Duquesne University on June 1. He was re-elected to the board of trustees of the National Industrial Conference Board in April, and was awarded an honorary degree of Doctor of Laws from Washington and Jefferson College on June 7.

Leon E. Hickman, vice president and general counsel of Alcoa, was awarded an honorary Doctor of Laws degree from Western Maryland College on June 2. He was elected president of the Association of General Counsel on October 21 and named chairman of the American Bar Association's Committee on Corporate Law Departments in the Association's Section on Corporation, Banking and Business Law.

Ralph B. Derr, chief chemical engineer of Alcoa's refining division, was awarded an honorary degree of Doctor of Science by Bucknell University on June 9.

Arthur V. Davis, honorary chairman of Alcoa, received an honorary degree of Doctor of Laws from Carnegie Institute of Technology on June 10.

H. C. Erskine, vice president in charge of smelting and fabricating operations, received a Distinguished Alumnus Award from Pennsylvania State University on June 14.

Edgar H. Dix, Jr., retired assistant director of research for Alcoa, was awarded the Distinguished Public Service Award on November 6 for his outstanding contributions to the Navy in the fields of scientific research and development. Mr. Dix was awarded an honorary degree of Doctor of Science from Carnegie Institute of Technology on June 10.

Frank L. Magee, president of Alcoa, received an honorary degree of Doctor of Laws from Maryville College on September 16.

FINANCIAL REVIEW OF 1958

Revenues and Net Income

Gross revenues for the year 1958 amounted to $758,143,787 compared with 1957 gross revenues of $875,461,218. Net income for 1958 amounted to $42,885,230 in comparison with the 1957 net income of $75,568,461. The decrease in both gross revenues and net income was due to the substantially lower rate of activity in the aluminum industry generally, which became noticeable during the latter part of 1957 and continued through 1958. Accordingly, Alcoa limited its 1958 production of primary aluminum to 520,000 tons as compared with 712,000 tons produced in 1957.

Early in the year a price decline in the world aluminum market adversely affected prices in the domestic industry. Consequently, the price of aluminum pig was reduced by two cents per pound on April 1, 1958, which was immediately followed by a decrease in prices of mill and other fabricated products. On August 1, 1958, when certain contractual wage increases became effective, the price of pig was increased $0.007 per pound and was followed by various upward adjustments in prices of certain mill and fabricated products. These adjustments, however, were insufficient to offset the effect of wage increases and other rising costs resulting from a lower sales volume and decreased operating rates.

Dividends

Regular quarterly dividends on the common stock in a total amount of $24,756,077.10 were paid during 1958 as follows:

Dividend Number	Record Date	Payment Date	Amount Per Share
74	2/14/58	3/10/58	$0.30
75	5/20/58	6/10/58	0.30
76	8/20/58	9/10/58	0.30
77	11/21/58	12/10/58	0.30

Preferred stock quarterly dividends paid during the year were $0.9375 each and aggregated $2,474,688.94 or $3.75 per share.

Capital Expenditures

The $600,000,000 capital expenditure program, initiated and carried forward in 1956 and 1957, continued throughout 1958 at reduced construction rates, and completion dates for certain components of the program were extended from those originally planned. Consequently, the 1958 capital expenditures were limited to $81,599,867. This amount, when added to capital expenditures in 1956 and 1957, totals $428,410,941 expended for capital additions and betterments of the previously announced $600,000,000 program. Although the program was extended, no part has been canceled, and the rate of completions of the various components was rescheduled to coincide with the anticipated future demand for the use of the facilities. Not all of the capital expenditures included in the expansion program are authorized, and there remain unexpended balances of presently authorized projects of $39,600,000.

It is anticipated that capital expenditures in 1959 will approximate $65,000,000, which will include preliminary construction expenditures in connection with the previously announced $150,000,000 Brokopondo Development in Suriname, S. A.

CAPITAL EXPENDITURES

Gross Revenues $758,143,787

Long-Term Debt

During the first quarter of 1958, the company increased its short-term borrowings under the Bank Credit Agreement of August 1, 1957, from $55,000,000 on December 31, 1957, to a total of $80,000,000. This agreement provided for short-term borrowings up to a maximum of $125,000,000, which could be converted on or before August 20, 1958, into term notes ranging in maturities from one to three years. The company decided early in 1958 to refinance the term loan agreement by means of a public issue of debentures. Accordingly, $125,000,000 of 25-year sinking fund debentures, due April 1, 1983, carrying an interest coupon of 3⅞%, were sold as of April 1, 1958, at a price of 99.60. The net proceeds were used to retire the $80,000,000 outstanding short-term bank notes, and the balance was added to working capital to be used for capital expenditures and other corporate purposes.

During 1958, the company acquired and submitted to the trustee for cancellation $10,000,000 principal amount of its 3⅛% debentures due February 1, 1964, in satisfaction of the mandatory sinking fund requirement in that amount due January 31, 1959. The company also acquired and submitted to the trustee for cancellation $3,650,000 principal amount of its 3% debentures due June 1, 1979, which, together with previous acquisitions, satisfied the mandatory sinking fund payment due May 31, 1959, in the amount of $4,150,000.

The annual installment of $2,500,000 due January 1, 1959, on the 2.55% note was paid December 31, 1958. The following table details the mandatory debt retirement schedule of outstanding long-term debt as of December 31, 1958:

(In Thousands of Dollars per Year)

	Debentures				Notes		
	3⅛% Due 1964	3% 1979	4¼% 1982	3⅞% 1983	2.55% 1967	3% 1975	Annual Total

Employees' Stock Option Plan

At the annual meeting on April 17, 1952, the shareholders authorized the company to reserve 1,956,292 shares (adjusted to give effect to the stock split-ups in 1953 and 1955) of its authorized but unissued common stock for the granting of options to employees. The purpose of the plan was to provide an incentive to key employees to become shareholders, thereby attaining a proprietary interest in the future development of the company. These options permit

6]

to purchase common stock from the com-
prices no lower than 95 per cent of the fair
lue at the dates the options are granted.
s on a total of 193,000 shares were issued to
on March 7, 1958, at 100 per cent of the
ween the high and low sales prices on the
k Stock Exchange on that date. These em-
ad received options on the same number of
July 24, 1956, at 95 per cent of the market
that date. However, the business decline and
g drop in stock prices defeated the purpose
56 options, and all but one option, covering
150 shares, were either surrendered to the company upon issuance of the 1958 series or were canceled or expired without being exercised.

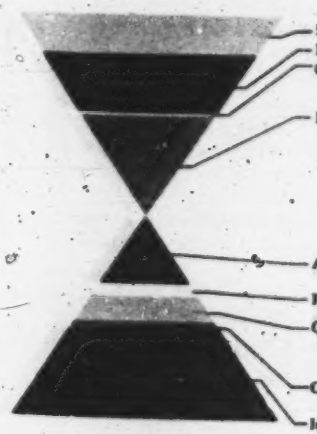
On January 1, 1958, there were 536,308 shares of the company's common stock reserved for future options; and on December 31, 1958, the shares so reserved totaled 537,508, the increase representing 1,200 shares on which outstanding options were canceled or expired during the year and thereby made available for future options.

The following table details pertinent information with respect to options outstanding in 1958:

	Options Granted			
	5/13/52	2/26/54	7/24/56	3/7/58
Option price	$17.6875	$29.375	$117.25	$68.50
Shares subject to unexercised options at January 1, 1958	89,052	92,186	193,850	None
Shares under options issued March 7, 1958	None	None	None	193,000
Shares purchased during 1958	21,677	12,867	None	2,994
Shares canceled or expired during 1958	None	None	700	500
Shares surrendered	None	None	193,000	None
Shares subject to unexercised options at December 31, 1958	67,375	79,319	150	189,506

Sources and Application of Funds

Cash flow during 1958, as briefed in the table below, resulted in a material increase in working capital from $187,788,303 on December 31, 1957 to $293,035,238 at the end of 1958.



Net income		$ 42,885,230

Income from securities and investments	1,660,425	1,988,103
Other income, including adjustments applicable to prior years	3,343,108	4,095,022
Gross revenues	758,143,787	875,461,218
Cost of goods sold and operating expenses	495,397,744	551,095,531
Selling, general administrative and other expenses	92,340,999	93,468,310
Provision for depreciation and depletion	65,659,603	57,658,306
Interest expense	17,647,233	14,643,746
Taxes, not including social security and United States and foreign taxes on income	12,712,978	14,026,664
Total costs and expenses	683,758,557	730,892,757
Income before United States and foreign taxes on income	74,385,230	144,568,461
Provision for United States and foreign taxes on income	31,500,000	69,000,000
Net income for the year	42,885,230	75,568,461
Retained earnings, beginning of year	549,468,997	501,103,551
	592,354,227	576,672,012
Dividends declared:		
On preferred stock—$3.75 per share	2,474,689	2,474,689
On common stock —$1.20 per share	24,767,339	24,728,326
	27,242,028	27,203,015
Retained earnings, end of year	$ 565,112,199	$ 549,468,997

STATEMENT OF *Consolidated Additional Capital*

For the years ended December 31, 1958 and 1957

	▼	▲
Additional capital, beginning of year	$ 34,463,868	$ 33,423,544
Excess of amounts received over the aggregate par value of common stock issued under Employees' Stock Option Plan	928,932	1,040,324
Additional capital, end of year	$ 35,392,800	$ 34,463,868

The appended notes are an integral part of the financial statements.

Notes *to consolidated financial statements*

NOTE A. Inventories are carried at the lower of cost or market, with cost being determined for substantially all inventories under the last-in first-out method. A classification of the inventories follows:

	December 31 1958	1957
Finished goods	$ 52,714,027	$ 54,547,769
Work in process	112,945,245	126,482,204
Bauxite and alumina	17,840,222	19,779,645
Purchased raw materials	15,107,509	15,589,256
Operating supplies	11,258,779	15,327,480
	$209,865,782	$231,726,354

NOTE B. Long-term debt comprises:

	December 31 1958	1957
Sinking fund debentures:		
3½%, due February 1, 1964	$ 52,500,000	$ 62,500,000
3%, due June 1, 1979	83,400,000	87,050,000
4½%, due January 1, 1982	125,000,000	125,000,000
5⅛%, due April 1, 1983	125,000,000	—
Notes payable:		
2.55%, due January 1, 1967	20,000,000	22,500,000
3%, due December 1, 1973	60,000,000	60,000,000
Other	2,583,669	2,107,698
Total long-term debt	468,483,669	359,157,698
Less, amount due within one year included in current liabilities	5,786,189	238,172
	$462,697,480	$358,919,526

NOTE C. Under an agreement made in 1953, and subsequently amended, the company has contracted to purchase primary aluminum from a Canadian corporation during the years 1959 through 1962 at the current market price in the United States at the time of shipment. Based upon the quoted market price at December 31, 1958, the amount of this commitment was approximately $84 million. The company has the option to postpone delivery of approximately $21 million of the above shipments for periods up to a maximum of five years by purchasing aluminum certificates which require the payment of one-half of the then current market price of the primary aluminum involved. Also, the company and the Canadian corporation both have the right to cancel approximately $13 million of the shipments.

Under an agreement made in 1955 with a Norwegian corporation, the company has contracted to advance, over a period of years, approximately $20 million and deliver about 760,000 metric tons of alumina to that corporation, with repayment to be made in primary aluminum. At December 31, 1958, approximately $13 million had been advanced and 50,000 metric tons of alumina delivered under the agreement. The repayment made in primary aluminum on account of the alumina delivered amounted to the equivalent of approximately 40,000 metric tons of alumina at December 31, 1958.

NOTE D. The various retirement plans for hourly rated and salaried employees provide that the cost of the plans will be borne entirely by the company and participating subsidiary companies through annual contributions to trust funds. These consist of actuarially determined contributions for current service and (until the estimated cost of benefits for past service shall have been fully funded) of contributions for past service in such amounts as the boards of directors deem advisable. In general, the plans provide for monthly pensions upon retirement at or after age 65 or upon earlier disability, incapacity or special circumstances. The amount of pension depends upon length of service, remuneration and the amount of certain social security and other benefits.

Amounts included in costs and expenses under the retirement plans amounted to approximately $9.2 million for 1958 and approximately $12 million for 1957. Of these amounts, approximately $1.2 million represented payments for employees' past service. At December 31, 1958, the unfunded amount of past service costs, based upon an actuarial estimate, was approximately $9.5 million.

The Alcoa Savings Plan for Salaried Employees, begun on a preliminary basis on November 1, 1957, was approved by the shareholders at their annual meeting in 1958. Under the trusteed plan, eligible salaried employees may save, depending upon length of service, from two to eight per cent of their salaries, and the company contributes one-half of the employees' savings. Each employee may choose whether all of his savings will be invested in U. S. Savings Bonds or one-half in such bonds and the other half in the company's common stock, but the company contribution must be invested in the company's common stock. The company contribution to the plan amounted to approximately $2.4 million for 1958 and approximately $400,000 for the period from November 1, 1957 to December 31, 1957.

NOTE E. Reference is made to the sections of this Annual Report titled "To the Shareholders of Alcoa" and "Financial Review of 1958" for information with respect to the proposed acquisition of the net assets of Rome Cable Corporation, capital expenditures and commitments related thereto, long-term debt and the employees' stock option plan.

COMMON STOCK of Aluminum Company of America is listed on the New York Stock Exchange.

PREFERRED STOCK of Aluminum Company of America is admitted to trading on the American Stock Exchange.

AUDITORS' REPORT

TO THE SHAREHOLDERS AND
BOARD OF DIRECTORS,
ALUMINUM COMPANY OF AMERICA:

We have examined the consolidated balance sheet of Aluminum Company of America and consolidated subsidiary companies as of December 31, 1958, and the related statements of consolidated income and retained earnings and additional capital for the year then ended. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the accompanying consolidated financial statements present fairly the financial position of Aluminum Company of America and consolidated subsidiary companies at December 31, 1958, and the results of their operations for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

*At March 31, 1958 there were 557,802 shares outstanding. The currently outstanding shares were used for the prior five year averages.

The drastic and steady decline in world price of copper, from a high of 54 cents per pound in March 1956 down to approximately 20 cents per pound in early 1958, caused an earlier reduction in incoming order volume in the copper fabricating business than was true of industry generally. As a result, your Company's sales and earnings showed a sizable decline from the previous year.

Earnings and Financial Condition

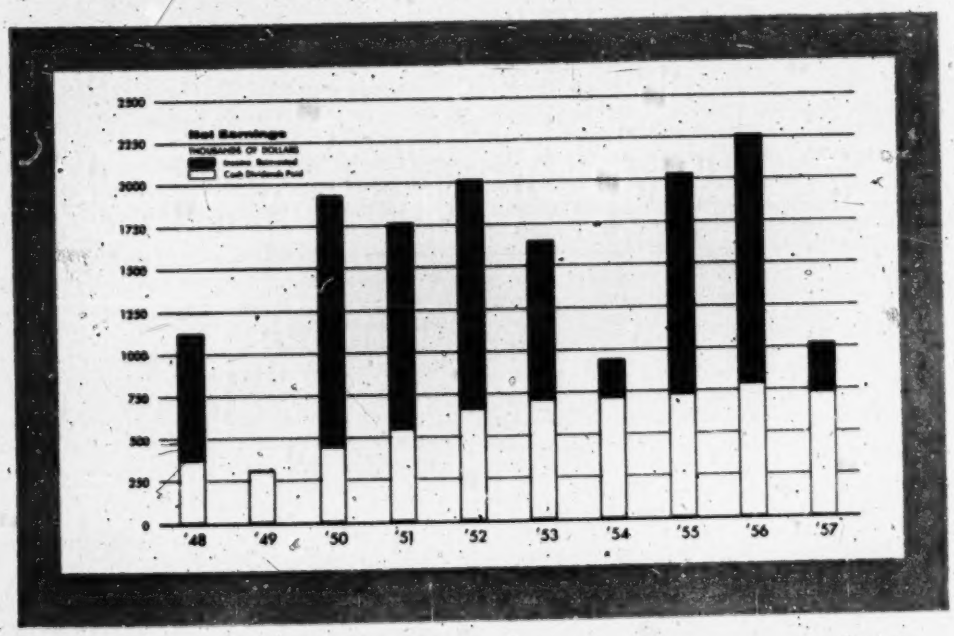
Net earnings for the year ended March 31, 1958 were $1,019,000, equal to $1.82 per share (557,802 shares outstanding) compared to $2,256,000, equal to $4.04 per share in the prior year with the same number of shares outstanding. Our strong cash position at the end of the year is reflected in an increase in working capital of $1,168,000, to a new high of $11,789,000. Fifty-two cents per share were added to share owners' equity, making the current book value $29.32 for each share of common stock outstanding, the highest in our twenty-two year history.

Earnings were affected not only by lower volume and higher labor rates, but also by several competitive price cuts which far exceeded reduction in the cost of materials.

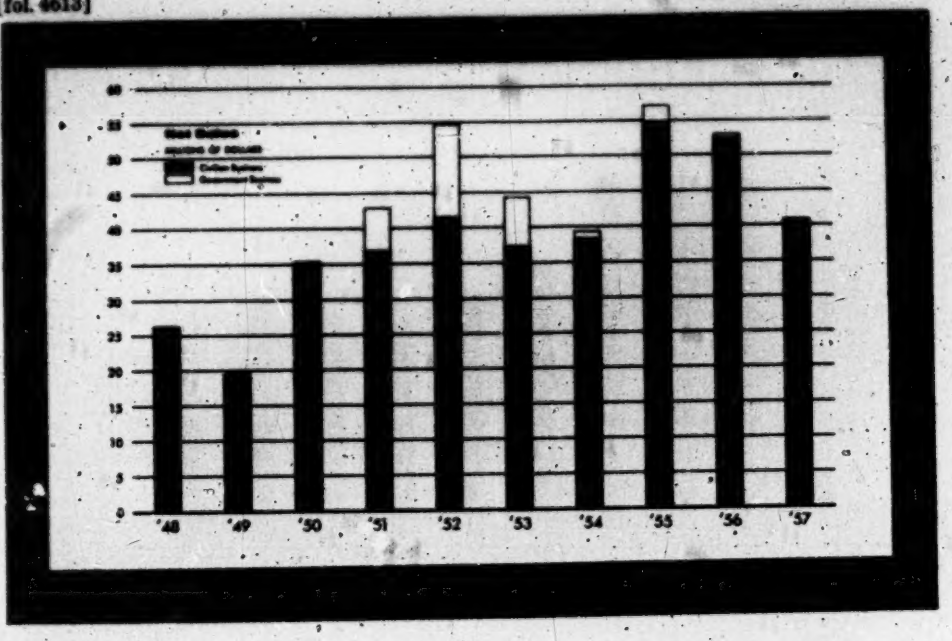
Dividends

Dividends were paid in the amount of $1.30 per share, a total amount of $725,000 during the year.

On May 9, 1958 the Board of Directors declared consecutive dividend No. 77 at the rate of 25 cents, payable on July 1, 1958 to share owners of record June 13, 1958.



[fol. 4613]



Sales

The dollar value of sales declined twenty-three per cent. Actual physical volume decline was somewhat less as falling copper prices and lower selling prices accentuated the percentage drop between the two years. Inventory liquidation by customers and decline in construction were largely responsible for the decrease.

Order backlogs declined steadily during the year. Since December, however, each month has registered a small but encouraging increase in incoming orders. April orders received were only slightly behind those of a year ago. Recent competitive selling prices in the wire and cable industry compared to those of a decade ago strongly refute government and labor's claims of price increases following wage advances. It is estimated that these unrealistic competitive price reductions affected net earnings in excess of one dollar per share.

Materials

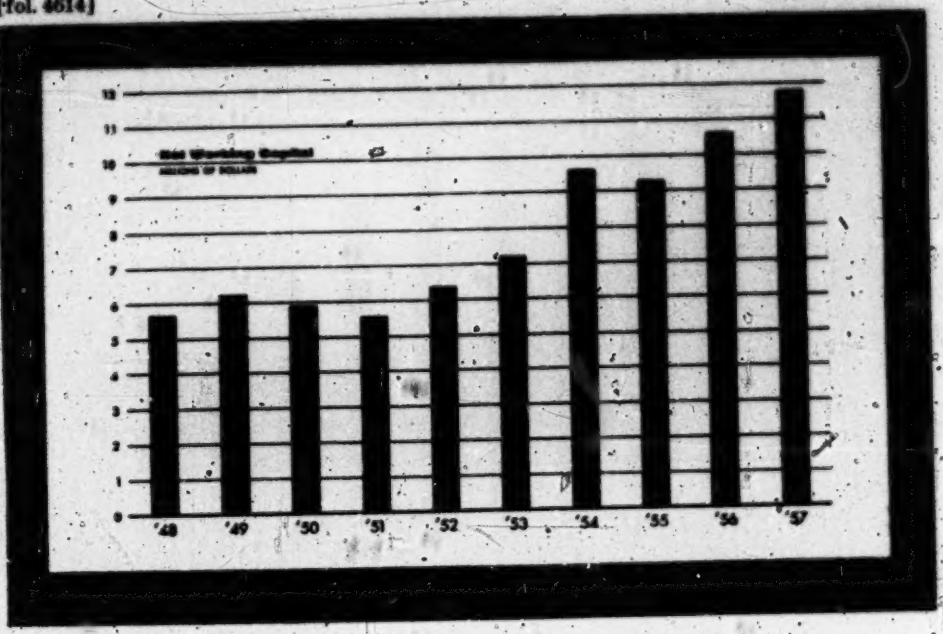
World prices for copper have remained appreciably below the domestic producer levels throughout the year. Although sizable cutbacks in production were announced at various times in the past year, U. S. refined production continued in the first quarter of 1958 at the same rate of two years ago, a time when copper fabricators were meeting an unprecedented demand. Present supplies in producers' hands have climbed to a postwar high since new mines and expanded properties have balanced the cutbacks.

Aluminum, steel and other materials are likewise in plentiful supply. Because of foreign competition it is probable that some import tax will be restored to copper after June 30th. This may stimulate some inventory replacement buying.

Labor

In April 1957 production employees of the Rome plant voted for the first time to have a union, The International Association of Machinists, as their bargaining representative. A contract was negotiated providing mainly the same terms as those previously granted voluntarily by the Company. Negotiations at Torrance with the United Steelworkers Union had similar results.

Employee relations have been harmonious despite a sizable reduction in the working force at Rome due to depressed volume.



Rome

Our Rome plant which makes wire and cable products suffered most from reduced volume and competitive price cutting, despite impressive reductions in the cost of production. Hand-to-mouth buying on a smaller scale and the multiplicity of items encouraged by the advent of new materials without adequately relinquishing the old required many uneconomical production runs to meet service demands and quality standards of customers. An incentive plan covering all production and maintenance indirect labor employees was installed and is realizing sizable savings.

Torrance

Our Torrance plant which makes conduit and steel tubing set a new record in sales volume and earnings. The improved earnings, despite increased labor and material costs, reflect the lower unit costs obtainable with increased volume and an aggressive cost reduction program.

Arrangements have been made to purchase five additional acres of land adjacent to our Torrance plant, and a program is well under way to expand our manufacturing facilities so as to be able to produce a broader range of conduit sizes.

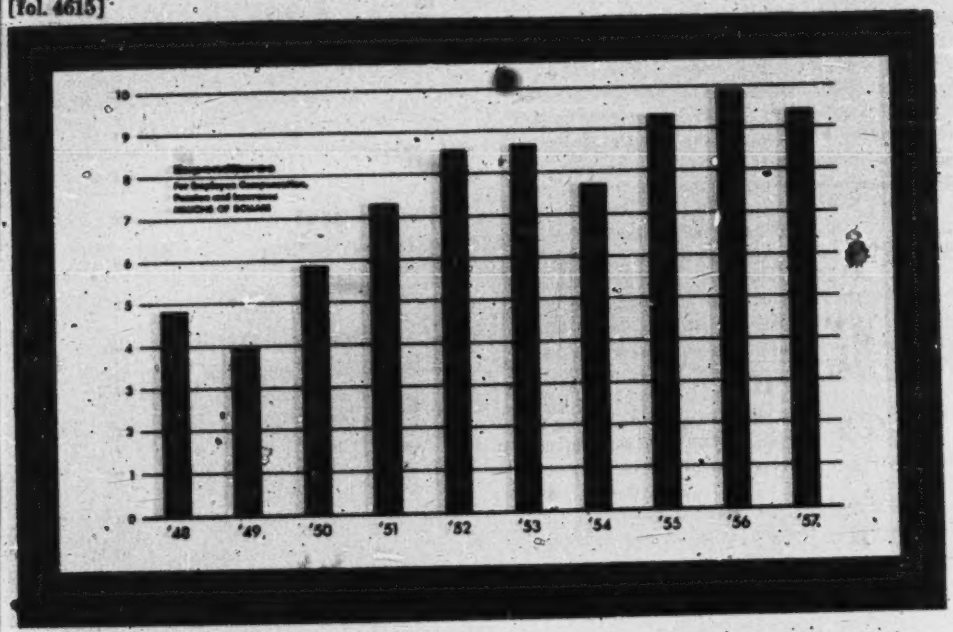
We have increased our participation in the mechanical tube market on the West Coast.

Copo

This division became a part of our Company at the beginning of the fiscal year as a further part of our policy of diversification to meet better the needs of our customers. Total sales volume set a record for this seventy-two year old Company, and earnings results warrant our faith in its potentialities. Considerable progress was made in the introduction and development of several new products, revamping of selling policies and promotional activities. While the Division is old in years, it has a young progressive organization that already works well with the parent Company.

Research and Development

In late April 1958 we started moving into our new Research Center, a picture of which is on the cover of this report. With this move in mind, certain technical personnel has been transferred to strengthen our manufacturing department for routine production control, and laboratory personnel has been re-



grouped to permit a greater amount of time for research and development activities. The move to the new laboratory provides space to bring all administrative manufacturing personnel together. The year saw further recognition of our organization's technical abilities and products by increased requests from customers to work on special projects. These involve certain utilities, industrials and government programs of a highly specialized nature, including missile and instrumentation cables. Several significant new patents have been granted. As evidence of the changing and progressive character of our business it is noted that almost forty per cent of the product sales last year were on items that we did not manufacture prior to 1950. We consider the completion of our new Research Center will stimulate future progress in the development of new products, of new and improved processes and practices.

Capital Expansion

A total of over one million nine hundred thousand dollars was expended for capital improvements. Major outlay included acquisition of our T. J. Cope Division at Collegeville, construction of our new Research Center, expanding our product range at Torrance and new stranding, flat rolling and enameling equipment at Rome. We started the manufacture of our own diamond dies in Rome during the year. Predicted improvements in quality and cost reductions have already been demonstrated even on reduced operations. Completion of some of the above installations and projected expenditures for the current year should total less than annual depreciation charges. The above planned expansion and rounding out of our product lines should stand us in good stead to meet the changing needs and potential increased demands of the future.

Long Term Loan

In order adequately to finance our capital expense program detailed elsewhere in the report, in July 1957 we paid off the balance of our former long-term loan amounting to $3,049,000 and borrowed $5,000,000 on fifteen year notes. J. P. Morgan & Co. Incorporated participated to the extent of $1,000,000 for a period of four years at 4¼% interest repayable at the rate of $250,000 per year. The Connecticut Mutual Life Insurance Company, Hartford, Conn. and Massachusetts Mutual Life Insurance Company, Springfield, Mass. participated equally in the remaining $4,000,000, and these notes bear interest at the rate of 4¾% to be retired

[fol. 4616]

after the four-year note at the rate of $300,000 per year until August 1, 1971, with the balance of $1,000,000 being due August 1, 1972. Provision is made for a sinking fund based on an earnings formula for retiring the insurance company notes at a maximum rate of an additional $100,000 per year at par starting August 1, 1958.

New York Stock Exchange

On July 24, 1957 the listing of your Company's shares was transferred from The American Stock Exchange to the New York Stock Exchange.

Rome Cable Foundation, Inc.

We contributed $40,000 to Rome Cable Foundation, Inc. compared to $100,000 a year ago. The Foundation now has resources totalling $335,000.

From Foundation funds twenty-two additional new scholarships have been granted bringing the total presently in effect to fifty-eight, of which thirty-four have been awards to relatives of employees of the Company.

Present and Future

As previously stated last year's dip in overall business, which affected our industry and our Company earlier and more severely than most industries, has slowed our growth trend. In offsetting lowered volume and more competitive pricing, cost reductions exceeding half a million dollars were made. Salary reductions effective May 1st will save an additional several hundred thousand dollars in the current year. This annual report you are reading will cost less than one-third what last year's did. Other steps have already been taken or planned for sizable cost reductions in other elements.

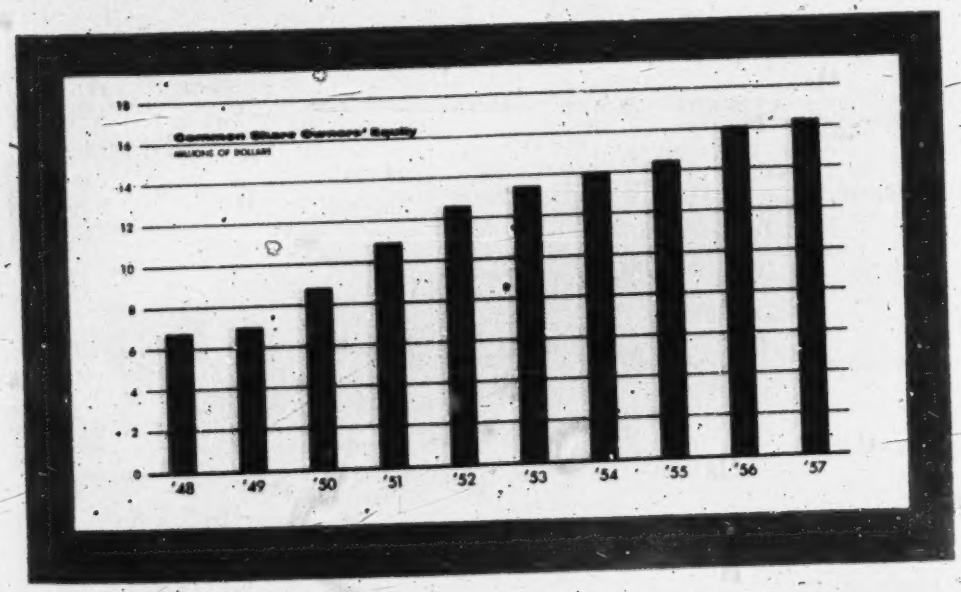
The results achieved at our Torrance and Collegeville plants at a time when our wire and cable products were suffering from lack of volume and low prices emphasize the wisdom of our diversification program. We are also carefully studying our best means of combatting rises in the cost of freight, ever increasing local and state taxes, and other manufacturing costs.

We continue to have faith in the growth of the electrical industry. Our facilities as well as the spirit of our organization should enable us to get our share in that growth.

We wish to thank the entire organization for their cooperation and teamwork during a difficult year.

On Behalf of the Board of Directors,
H. T. Dyett, *Chairman of the Board*
A. D. R. Fraser, *President*

May 22, 1958



...that Rome Cable received for its products

Rome Cable received	$40,615,000
These receipts were used	
To buy copper, steel, aluminum, rubber, plastics, textiles, etc.	23,465,000
To meet expenditures for employee compensation, pensions and insurance	9,452,000

Less allowances for depreciation and amortization	7,173,697	8,965,566
		$23,989,644

NOTES TO FINANCIAL STATEMENTS

NOTE A — Inventories are stated generally at cost, and include an amount of $6,321,765 (over 90%) which was computed by the last-in, first-out method. Total inventory valuation is well below aggregate market prices.

NOTE B — The promissory notes (4¼%) provide for additional payments, due each August 1st, limited to $100,000 for each year, contingent on earnings of the preceding fiscal year, to be applied to the latest maturities of the notes.

So long as the notes are outstanding, the Company is required, among other things, to maintain net working capital (excess of current assets over current liabilities) at stipulated amounts. At March 31, 1958, net working capital exceeded such requirement by more than $4,400,000.

The terms of issuance of the notes place certain restrictions upon the payment of dividends (except stock dividends) and the redemption, retirement or purchase by the Company of its capital shares. At March 31, 1958, the portion of earnings retained in the business not affected by these restrictions was approximately $2,293,000.

[fol. 4619]

LIABILITIES AS OF MARCH 31, 1958

CURRENT LIABILITIES:		
Portion of long-term debt payable within one year		$ 350,000

Accrued expenses		670,540
Federal taxes on income — estimated		817,754
TOTAL CURRENT LIABILITIES		$ 2,954,529
LONG-TERM DEBT — Note B:		
Promissory note (4¼ %), due in semi-annual installments of $125,000 to August 1, 1961 less $250,000 due and payable within one year and included above	$ 625,000	
Promissory notes (4¾ %), due in annual installments of $300,000 from August 1, 1962, balance due August 1, 1972, less $100,000 payable within one year and included above	3,900,000	4,525,000
RESERVE:		
For difference between cost and prices charged to customers for returnable reels, spools and cases		156,115
CAPITAL INVESTED:		
Capital Shares:		
Common Stock ($5 par value) — Note C:		
Authorized 1,200,000 shares; outstanding 557,802 shares; in treasury 34,000 shares; issued 591,802 shares	$ 2,959,010	
Additional capital paid in for stock, plus amounts transferred from earnings retained in the business	3,285,612	
	$ 6,244,622	
Earnings retained in the business — Notes B and D:		
Unappropriated	10,425,822	
Appropriated for contingencies	450,000	
	$17,120,444	
Less cost of Common Stock in treasury — 34,000 shares	766,444	16,354,000
		$23,989,644

NOTE C — At March 31, 1958, 37,800 shares of Common Stock were reserved under a Stock Option Plan for certain key employees. On June 20, 1956, options were granted to 31 officers and key employees to purchase an aggregate of 34,400 shares of Common Stock at a price equivalent to $25.57 per share (95% of fair market value at date of grant). The options, none of which had been exercised at March 31, 1958, are exercisable in cumulative annual installments and continue in force for ten years from date of grant. No options were granted during the year ended March 31, 1958.

NOTE D — Renegotiation proceedings for years up to the fiscal year ended March 31, 1953 have been concluded. It is believed that any renegotiation refunds which might be required for subsequent years would not materially affect the financial position of the Company at March 31, 1958, or earnings for the year then ended.

NOTE E — There is in effect a non-contributory pension plan for the benefit of all regular employees. The unfunded past service cost, at March 31, 1958, was approximately $2,160,000. During the year, the Company provided $348,517 under the plan, of which $130,116 was applicable to past service cost.

To The Board of Directors,
Rome Cable Corporation:

We have examined the financial statements of Rome Cable Corporation for the year ended March 31, 1958. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the accompanying statement of financial condition, operating statement and analysis of capital invested present fairly the financial position of Rome Cable Corporation at March 31, 1958, and the results of its operations for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

Ernst & Ernst

New York, New York

ROMB CABLE

[fol. 4625] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 23

Question 6

The names and locations of all companies, from whom stock or assets were acquired within the last ten years (i) by Rome and (ii) by Alcoa.

Rome

Acquisitions by Rome are:

T. J. Cope, Inc. (Assets) — Collegeville, Pa.

Andersen-Carlson Mfg. Company (Assets) — Torrance, Calif.

Note: Rome also owns some stock in American Synthetic Rubber Corporation, Louisville, Kentucky and some debentures in Mohawk Airlines, Inc., Utica, New York.

Alcoa

Acquisitions by Alcoa which relate to the business conducted by Rome are:

Aco, Socieded Anonima (Stock) (1) — Caracas, Venezuela

D.P.C. plant from War Assets Administration (Assets) (2) — Massena, N. Y.

---

(1) Alcoa, through a subsidiary, owns forty-five percent of the stock of Aco. Aco does no manufacturing. It is included here because it sells, among other products, Alcoa electrical conductor.

(2) This is a smelting plant which is now part of Alcoa's Massena Works. It is included because electrical conductor pig, which is made at this plant, is used in making conductor.

[fol. 4626] Question 11

For each product listed in your answer to question 9, give the ten principal manufacturers of similar products in the industry and their approximate share of the total sales in the various product categories. To give an accurate account, include not only Rome's and Alcoa's shares in the markets, but also those of foreign manufacturers if applicable.

It is not possible on the basis of available information to assign to individual companies approximate shares of total industry sales for the products listed in the answer to question 9, except for Alcoa and Rome; in many cases it is not even possible to indicate which of the companies manufacturing a given product are the "ten principal manufacturers." We, therefore, have prepared and enclose herewith a list for each product of all manufacturers of that product known to us and have indicated by asterisks the ones we believe are among the first ten. These lists have been compiled from information tabulated by BDSA, reinforced by our knowledge of the industry. In cases where an industry sales figure for a given product is available, we have given Alcoa's and Rome's share of that industry figure.

[fol. 4646] IN UNITED STATES DISTRICT COURT
PLAINTIFF'S EXHIBIT 27

Question 3. For each of the years 1953 through 1958 and for each quarterly period in 1959, state:

(a) The total quantity and dollar value of aluminum E.C. Redraw Rod manufactured by Rome.

Redraw Aluminum Rod Manufactured

	Total Production	Value*
1953	982,967 lbs.	$ 260,486
1954	1,818,226	485,466
1955	3,259,250	977,775
1956	4,778,372	1,570,651
1957	3,796,028	1,300,140
1958	3,360,216	1,114,584
1st Q. 1959	946,117	306,060
2nd Q. 1959	1,105,760	357,271

*Value shown is derived for 1953 and 1954 by multiplying production by annual average market price, because Rome sold no rods for these years, and for other years by multiplying production by annual average sales price.

(b) The total quantity and dollar volume of aluminum E.C. Redraw Rod purchased by Rome from other companies, giving a breakdown showing the name and address of, and the quantity and dollar volume purchased from each such other company.

	Purchased Rods	Seller
1953	100,423 lbs.	$ 26,310 Alcoa
1954	483,845	127,511 Alcoa
	3,982	1,102 Aluminium Ltd. Sales
1956	150,936	43,433 Kaiser Aluminum Co.
1957	442	161 Reynolds Metal Co.

(c) The quantity and dollar value of aluminum E.C. Redraw Rod used by Rome in the manufacture of wire and cable.

Rod Used by Rome Cable Corp. in Manufacture of Wire and Cable

		Value*
1953	1,083,390 lbs.	$ 287,098
1954	2,302,686	614,817
1955	3,254,470	976,341
1956	4,790,229	1,574,548
1957	3,378,150	1,157,016
1958	2,972,748	986,061
1st Q. 1959	843,245	272,790
2nd Q. 1959	957,805	309,467

*Value shown is derived for 1953 and 1954 by multiplying production by annual average market price, because Rome sold no rods for these years, and for other years by multiplying production by annual average sales price.

[fol. 4647] (d) The total quantity and dollar volume of aluminum E.C. Redraw Rod sold by Rome to other companies, giving a breakdown showing (i) the name and address of, and the quantity and dollar volume sold to each such other company and (ii) the quantity and dollar volume of shipments to each state and to Canada.

[fol. 4649] 13. (a) List the machinery and equipment for the manufacture of rod which can be used interchangeably in the manufacture of aluminum E.C. Redraw Rod and copper rod.

(b) To the extent that machinery or equipment for the manufacture of rod cannot be used interchangeably, please explain what steps would be necessary including the economic factors involved,

(i) to convert machinery or equipment for the making of aluminum E.C. Redraw Rod to machinery or equipment for the making of copper rod;

(ii) to convert machinery or equipment for the making of copper rod to machinery or equipment for the making of aluminum E.C. Redraw Rod; and

(iii) to convert machinery or equipment to make both aluminum E.C. Redraw and copper rod.

(a) None

(b) (i) Equipment cannot be converted

(ii) Copper rod rolling mill could be converted but only upon a basis which would be completely uneconomic. Under present known circumstances, no one would make the decision to do this. Moreover, any such conversion would mean the loss of all copper rod production capacity, since the equipment could not be used interchangeably.

(iii) For the reasons given in (b i) and (b ii) above this would be impossible, impractical or uneconomic.

[fol. 4650] 14. Describe Rome's machinery and equipment used at any time for the manufacture of copper rod which also has been used at any time since January 1, 1953 for the manufacture of aluminum rod.

None

[fol. 4651] 15. (a) List the machinery and equipment for the manufacture of wire and cable which can be used interchangeably in the manufacture of aluminum wire and cable and the manufacture of copper wire and cable.

(b) To the extent that machinery or equipment for the manufacture of wire or cable cannot be used interchangeably, please explain what steps would be necessary, including the economic factors involved.

(i) to convert machinery or equipment for the making of aluminum wire and cable to machinery or equipment for the making of copper wire and cable;

(ii) to convert machinery or equipment for the making of copper wire and cable to machinery or equipment for the making of aluminum wire and cable; and

(iii) to convert machinery or equipment to make both aluminum wire and cable and copper wire and cable.

(a) Bare Wire—

(4) Flat Rolling Machines
(10) Small Larmouth Type Strand-ers
(5) Large Larmouth Type Strand-ers
(1) Large Rigid Frame Strander
(11) New England Butt Bunch Stranders
(7) Haskell Dawes Bunch Strand-ers
(1) 61 Bobbin Watson Strander

Magnet Wire—

(12) Horizontal Cotton and Paper Covering Machines
(2) 10 Spindle Vertical Cotton Covering Machines
(1) Heavy Asbestos Covering Ma-chine
(7) Horizontal Glass Covering Ma-chines
(1) 8 Spindle Vertical Glass Cover-ing Machine
(1) Heavy 5 Wire Enamelling Unit
(1) Heavy 6 Wire Enamelling Unit

Weatherproof—	(4) Cable Braiders
	(12) Sinfra Knitters
	(3) Saturating Units
	(2) Large Finishing Units
	(1) Small Finishing Unit
Rubber Covered—	(3) 3¼" Rubber Type Insulating Machines
	(2) 3½" Rubber Type Insulating Machines
	(4) 4½" Rubber Type Insulating Machines
	(2) 6" Rubber Type Insulating Machines

[fol. 4652]

Plastic Dept.—	(4) 1½" Plastic Insulating Machines
	(1) 2½" Plastic Insulating Machines
	(2) 3¼" Plastic Insulating Machines
	(3) 4½" Plastic Insulating Machines
	(1) 6" Plastic Insulating Machines

In addition to the above we have secondary or supplemental equipment or machinery as follows:

Bare Wire—	(17) Electric Annealing Pots
	(4) Water-Seal Annealing Furnaces
Magnet Wire—	None
Weatherproof—	None
Rubber Covered—	(4) Small Wire Twisters
	(1) Large 37 Bay Cabler
	(1) 48 Bay Cabler
	(1) Large 7 Wire Cabler
	(2) 30" Cord Twisters
	(1) 44" Cable Twister
	(1) Reverse Lay Cabler
	(1) Service Entrance Cable Machine
	(2) Taping Machines
	(2) Lead Extruders

(2) Saturating Machines
(2) Finishing Machines
(4) Water Test Tanks
(4) Horizontal Vulcanizers
(2) Dome Vulcanizers
(1) 8 Spindle Lacquer Tower
(141) Small Braiders
(7) Cable Braiders
(2) Rubber Banburys

Plastic Dept.— (2) Non Metallic Sheath Cable Finishers
(24) Non Metallic Sheath Cable Braiders
(16) Non Metallic Sheath Cable Paper Wrap Machines
(8) Striping Machines
(1) Small Edmands Twister
(1) Large Edmands Twister
(3) Water Test Tanks
(1) Plastic Banbury

b (i) To convert (1) Heavy Intermediate Aluminum Rod Drawing machine and (1) Heavy Aluminum Rod Drawing machine would necessitate the following:

(1) A new motor on the Heavy Intermediate Machine—
(2) A new motor on the Heavy Rod Drawing Machine—
(3) Change the type of drawing lubricant.

[fol. 4653] Note: Due to the condition of these machines, speeds would have to be reduced to the point where they would be uneconomical to run.

b (ii) Would necessitate changing the type of drawing lubricant on all copper drawing machines:

(2) Heavy Intermediate Machines
(4) Light Intermediate Machines
(4) Heavy Rod Drawing Machines
(1) Bull Block
(29) Fine Wire Machines

b (iii) Would have to install a copper drawing lubricant system at the aluminum drawing machines (b (i) above) and would have to install an aluminum drawing lubricant system at the copper drawing machines (b (ii) above). Quality of both copper and aluminum products would be adversely affected.

[fol. 4654] 16. Describe Rome's machinery and equipment, used at any time for the manufacture of copper wire and cable which has also been used at any time since January 1, 1953 for the manufacture of aluminum wire and cable.

Bare Wire— 5 Large Larmouth Type Stranders
2 Small Larmouth Type Stranders
1 New England Butt Bunch Strander
1 Haskell Dawes Bunch Strander

Magnet Wire— Small experimental runs have been made on approximately 6 Horizontal Paper and Cotton Machines.

Weatherproof— (4) Cable Braiders
(12) Sinfra Knitters
(3) Saturating Units
(2) Large Finishing Units
(1) Small Finishing Unit

Rubber Covered—Detail records are not available but approximately one-half the number of the Rubber Type Insulating Machines have been used at various times.

Plastic Dept.— Detail records are not available but approximately one-half the number of the Plastic Insulating Machines were also used at various times.

Note: In addition to the above, the secondary or supplemental equipment listed in 15 (a) above has also been used at one time or another.

[fol. 4655] 17. Describe the changes, if any, in Rome's production facilities and marketing organization which have been made since March 31, 1959 and the changes which are contemplated.

Production Facilities

Changed since March 31, 1959:

(a) New 6 Spindle Heavy Wire Enamel Unit mentioned 15 (a) above.

Changes which are contemplated:

(b) (1) 37 Wire Cabler being transferred to Rome Plant from surplus equipment at the Vancouver, Washington Plant (formerly a stranding machine)
(2) New double spindle Haskell Dawes Bunch Stranders (replacement).
(5) New small Larmouth Type Stranders (one of these is a replacement).

Marketing Organization

Since March 31, 1959 five employees, previously associated with the Alcoa marketing organization, have been transferred to the Rome marketing organization. It is expected that, ultimately the Alcoa marketing organization for electrical conductors and conduit will be integrated with the Rome marketing organization and all marketing responsibility for electrical conductors and conduit will be lodged with Rome.

[fol. 4656] In United States District Court

Plaintiff's Exhibit 28

Memorandum

Re: Arrangement Between Rome Cable Corporation and Aluminum Company of America

1. Rome Cable Corporation (hereinafter referred to as Rome Cable) will cover bare aluminum wire furnished by Aluminum Company of America (hereinafter referred to as Alcoa) for the account of Alcoa.

2. Upon Alcoa's request, Rome Cable will, from time to time, quote its prices for processing various sizes of bare aluminum wire with various types of covering. Rome Cable may adjust its quoted prices downward at any time without notice or upward upon thirty five (35) days' notice to Alcoa.

3. Rome Cable is prepared to process 500,000 pounds of

bare aluminum wire with Neoprene and 400,000 pounds of bare aluminum wire with plastic during the balance of the calendar year 1952 and is prepared to process a minimum of 3,000,000 pounds of bare aluminum wire with either type of covering during the calendar year 1953, and a minimum of 1,000,000 pounds during the period January 1-March 31, 1954.

Rome Cable and Alcoa contemplate that Alcoa's requirements for covered wire may increase to such an extent that if Rome Cable is to meet those requirements it will need additional facilities. If Alcoa requests Rome Cable to acquire additional facilities involving a substantial capital investment, Rome Cable will, within thirty (30) days of such request, advise Alcoa as to its decision with regard to making such investment and in the event Rome Cable agrees to make such investment, the period of this arrangement will be extended.

4. The arrangement between Rome Cable and Alcoa shall continue until terminated by either party upon 9 month's notice to the other, provided, however, that the earliest [fol. 4657] termination date shall be April 1, 1954, and provided further that in the event Rome Cable at the request of Alcoa makes a substantial capital investment for the purpose of meeting Alcoa's increasing requirements for covered wire, the period of this arrangement will be extended.

5. Alcoa will designate a representative at its plant at Massena, New York, and a representative at its principal office in Pittsburgh, Pennsylvania. These representatives will have full power and authority to act on behalf of Alcoa in connection with the administration of the arrangement between Alcoa and Rome Cable and Rome Cable will be fully justified in relying wholly on the decisions of, and acting pursuant to the directions of, either of such representatives in any matters pertaining to the carrying out of such arrangement.

Rome Cable will designate a representative at its principal office in Rome, New York, who will have full power and authority to act on behalf of Rome Cable in connection with the administration of the arrangement between Alcoa and Rome Cable and Alcoa will be fully justified in relying wholly on the decisions of, and acting pursuant to the directions of, such representative in any matter pertaining to the carrying out of such arrangement.

PLAINTIFF'S EXHIBIT 30

Aluminum Company of America
Pittsburgh 19, Pa.

November 21, 1955.

Mr. Glenn Reston,
Rome Cable Corporation,
Rome, New York.

Dear Glenn:

Please refer to my letter to you dated November 4th, 1955. As a result of our subsequent discussions and in the light of the second paragraph of numbered paragraph 3 of the "Memorandum Re: Arrangement Between Rome Cable Corporation and Aluminum Company of America" initialed by Mr. R. V. Davies on March 7th, 1952, we hereby request that Rome Cable Corporation acquire additional facilities for increasing its production for the application of neoprene covering on aluminum wire and cable.

Alcoa has no immediate intention of acquiring similar facilities and hereby gives you assurance that it intends to rely upon Rome Cable Corporation to continue the covering of aluminum wire and cable, as outlined in numbered paragraph 1 of the memorandum, with neoprene for the period ending January 1st, 1957, after which date the period may be extended from time to time by mutual agreement, all provided, of course, that Rome Cable Corporation acquires and maintains ample facilities to handle the order load in accordance with Alcoa's present and future requirements.

Very truly yours, Aluminum Company of America,
Philip T. Coffin, Manager, Electrical Industry Sales.

PTC:ags

[fol. 4659] In United States District Court

Plaintiff's Exhibit 31

Rome Cable Corporation
Rome, N. Y.

A. D. R. Fraser, President

December 16, 1955.

Mr. Ralph V. Davies, Vice President,
Aluminum Company of America,
1501 Alcoa Building,
Pittsburgh 19, Pa.

Dear Ralph:

In accordance with the request, per Mr. P. T. Coffin's letter of November 21, 1955 to our Mr. G. E. Rolston, we are acquiring additional facilities for increasing our production for the application of neoprene covering on aluminum wire cable. We have already made available to you starting December 1, 1955 sufficient capacity to apply a neoprene covering to 5,700,000 Factor I feet per month and to twist 2,500,000 ft. per month, continuing for the duration of our agreement. With an additional capital investment we will acquire facilities enabling us to make available to you capacity for an additional 1,300,000 feet of neoprene covering starting in May, 1956. In view of the capital investment required, we feel that the agreement should be extended until May 1, 1957.

We suggest that about the year ended 1956, we should consider whether a further extension is mutually desired.

If this letter meets with your approval, we would appreciate it if you will sign and return the enclosed copy.

Sincerely, Ron Fraser, President.

ADRF/m

Approved: Aluminum Company of America, by R. V. Davies, December 26, 1955.

[fol. 4660] Question 20. (a) List the names of companies, other than Alcoa, for whom Rome performed, during the period from January 1, 1953 to date, insulation work on copper or aluminum conductor, whether pursuant to contract or otherwise.

(b) For each such company, give the amount received by Rome for such work during each of the years 1953 through 1958 and each quarterly period of 1959, and describe the arrangements under which such work was performed.

Westinghouse Electric Corporation

Year	Amount Received	
1953	$584,655	Charge generally computed by subtracting copper cost from regular price for finished material.
1954	435,533	
1955	382,220	
1956	477,658	
1957	555,749	
1958	195,657

Graphite
Gold
Platinum

Protected End (Cathodic or most noble)

(a) In general, when determining which of the two materials will be attacked by electrolytic corrosion, the material nearer the bottom of the list will not be corroded and the material nearer the top will be.

(b) Galvanic corrosion will usually take place only if the two materials are in intimate contact and in the presence of a conducting solution, which need be only a thin film of water.

(c) Galvanic action is an area effect, i.e. if a large steel sheet has a copper rivet in it, the steel will be corroded only in the area of the rivet, whereas if a large copper sheet has a steel rivet in it, the steel rivet would be attacked relatively quickly.

(d) Corrosion can occur by galvanic action if a metal is placed in a solution of a metallic salt which is lower in the galvanic series.

[fol. 4668]

IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 33

Question 1(a)

For each of the years 1953 through 1958 and for each quarterly period in 1959, state: (a) the total quantity and dollar value of aluminum E.C. redraw rod manufactured by Alcoa

	1953		1954		1955		1956		1957		1958		1st Quarter - 1959		2nd Quarter - 1959	
	Pounds (Thousands)	Dollars	Pounds (Thousands)	Dollars	Pounds (Thousands)	Dollars	Pounds (Thousands)	Dollars	Pounds (Thousands)	Dollars	Pounds (Thousands)	Dollars	Pounds (Thousands)	Dollars	Pounds (Thousands)	Dollars
E.C. Redraw Rod Manufactured on Toll Conversion Basis(1)	1,468	109	11,549	756	2,125	148	4,892	366	0	0	0	0	0	0	0	0
E.C. Redraw Rod Manufactured for Sale and for Own Use(2)	102,075	27,050	101,003	26,968	98,102	27,469	89,537	28,562	90,544	30,694	81,168	24,394	20,132	5,818	24,924	7,178
Total E.C. Redraw Rod Manufactured	103,543	27,159	112,552	27,724	100,227	27,617	94,429	28,928	90,544	30,694	81,168	24,394	20,132	5,818	24,924	7,178

Notes: (1) The value shown for toll conversion E.C. redraw rod represents the price paid for the toll conversion service.

(2) The value assigned to E.C. redraw rod manufactured for sale and own use is the annual average revenue from sales in the United States and Canada.

[fol. 4669] Question 1(b)

For each of the years 1953 through 1958 and for each quarterly period in 1959, state: the total quantity and dollar volume of aluminum R.C.-reducer rod sold by Alcoa (exclusive of sales by its subsidiary, Rome) to other companies, giving a breakdown showing the quantity and dollar volume of shipments to each state and to Canada

	1954		1955		1956		1957		1958		1st Quarter - 1959		2nd Quarter - 1959

Notes: (1) Total Aluminum Company of America sales to all companies for 1953 were 26,254,000# and $6,947,000. No records of 1953 sales by states and Canada are available.

(2) For 1954, records are slightly incomplete. 473,000# and $130,000 of the total sales cannot be identified by territory.

[fol. 4670]

Question 2

"Facts for Industry," Series M33-2-08, for release March 18, 1959, Table 2, gives for 1958 a total industry shipments figure of 174,847,000 pounds for "ACSR and aluminum cable, bare". The response to question 10 of our letter of February 2, 1959, gives a total industry sales figure of "Bare Aluminum Wire and Cable & ACSR" in the amount of 178,906,000 pounds.

(a) How may these two figures be reconciled?

(b) Is the answer to question 9 of our letter of February 2, 1959, with respect to "Bare Wire and Cable -- Aluminum & ACSR", limited to conductor wire and cable?

Answer:

(a) Total industry shipments of "Bare Aluminum Wire and Cable & ACSR" shown in the response to Question 10 of the Department of Justice letter of February 2, 1959, included bare E. C. wire. Industry shipments of E. C. wire were not included in the 1957 or 1958 Facts for Industry report of shipments of "ACSR and Aluminum Cable, Bare." As indicated in Note (3) to the response to Question 10, the volume of bare E. C. wire shipments was estimated. The estimate for 1958 was 4,059,000 pounds.

(b) The volumes reported as "Bare Wire and Cable -- Aluminum & ACSR" and "Bare Aluminum Wire and Cable and ACSR" in the response to Question 9 of the Department of Justice letter of February 2, 1959, are of products designated as Electrical Conductor. It should not be implied, however, that these products are always used for the purpose of conducting electricity. Some customers purchase E. C. grade wire for non-electrical applications, such as refrigerator shelves.

Question 3

For each of the years 1953 through 1958, and for each quarterly period in 1959, (A) state the total quantity and volume of sales by Alcoa (exclusive of sales by its subsidiary, Rome) of each of the following products, and (B) give a breakdown showing the quantity and dollar volume of shipments to each state and to Canada of each such product sold:

(a) Bare Aluminum Wire and Cable and ACSR

	1954		1955		1956		1957		1958		1st Quarter - 1959		2nd Quarter - 1959

Aluminum Company of America	0	0	0	0	0	0	0	0	1	1	0	0	0	0

Notes: (1) Total Aluminum Company of America sales to all companies for 1953 were 1,484,000# and $1,303,000. No records of 1953 sales by states and Canada are available.

(2) For 1954, records are slightly incomplete, and 103,000# and $85,000 of the total sales cannot be identified by territory.

(3) ( ) denotes credit. Credit figures result from cases where customers' returns and adjustments exceed shipments in a given territory and year.

Total	0	0	2	7	1	5	2	3	3	6	0	0	0	0

Notes: (1) Total Aluminum Company of America sales to all companies for 1953 were 1,932,000# and $4,276,000. No records of 1953 sales by states and Canada are available.

(2) For 1954, records are slightly incomplete, and $149,000 of the total sales cannot be identified by territory.

[fol. 4678] Questions 4 and 5.

List all products manufactured by Alcoa during the year 1954 (and 1958) showing, for each such product separately, the product code, unit of measure, quantity and value, as reported for the 1954 and 1958 Census of Manufactures, excluding those census code products manufactured by Alcoa which are not the same or similar to those manufactured by Rome and reported for the 1954 and 1958 Census of Manufactures

	Product Code	Unit of Measure	1954 Quantity (Short Tons)	1954 Dollars (Thousands)	1958 Quantity (Short Tons)	1958 Dollars (Thousands)
Aluminum Rod and Bar Rolled and Continuous Cast	33522-11-9	Short Tons	104,109(1)	65,165(1)	73,074(1)	58,422(1)
Bare Wire, Conductor	33922-11-1	Short Tons	241	162	137	137
Aluminum Cable Steel Reinforced (ACSR) and Other Bare Aluminum Cable	34892-61-1	Short Tons	35,561	26,594	28,418	23,883
Thermoplastic Covered	36312-35	(2)		63		
Polychloroprene (Neoprene) Covered	36312-37-5	(2)		88		488
Other (Include Thermoplastic Covered)	36312-39-1	(2)				980
Service Entrance Cable	36312-46-3	(2)		1,060(3)		3,033(4)
Unclassified	36312-98	(2)		728(5)		

Notes: (1) E.C. redrav rod is included in this code on Census of Manufactures report. However, a large part of the tonnage and value reported against this code is alloyed rod and bar, which is not manufactured by Rome.
(2) Census of Manufactures does not provide for reporting quantities on these items.
(3) Reported in error on Census of Manufactures report as Code 36312-46-3, service entrance cable. It is estimated that $790,000 should have been reported as rubber insulated, Code 36312-44-7, and $270,000 as thermoplastic insulated, Code 36312-45-0.
(4) Reported in error on Census of Manufactures report as Code 36312-46-3, service entrance cable. It is estimated that $1,185,000 should have been reported as rubber insulated, Code 36312-44-7, and $1,848,000 as thermoplastic insulated, Code 36312-45-0.
(5) Reported in error on Census of Manufactures report as Code 36312-98, unclassified. It is estimated that $276,000 should have been reported as thermoplastic covered, Code 36312-35, and $452,000 as polychloroprene (neoprene) covered, Code 36312-37-5.
(6) Shipments of aluminum conduit (Codes 36112-31 and 36112-32) were not reported separately on Census of Manufactures report due to insignificant tonnages involved.

[fol. 4679]

Question 6

With respect to each of the following categories, give for each of the years 1948, 1950, 1952, 1954, 1956 and 1958 (a) the quantity and dollar volume of (i) Alcoa's total sales and (ii) such sales broken down as to shipments to each state and to Canada

	(2) Open Wire (Covered for Distribution)						(3) Open Wire (Bare for Distribution) (4) Open Wire (Bare for Transmission)						(5) Service Drop Cable

Wyoming	0	0	0	0	2	1	199	85	141	72	63	30	18	18	13	13	24	17
Canada, by: Aluminum Company of America	0	0	0	0	1	1	0	0	15	7	1	1	0	0	0	0	0	0

Notes: (1) Item (1) aerial cable, and Item (6) service entrance cable, are not produced, or sold, by Alcoa.
(2) Item (3) open wire (bare for distribution), and Item (4) open wire (bare for transmission) are combined into one category, since sales of bare conductor cannot be divided accurately between distribution and transmission. A large percentage of bare conductor can be used for either purpose, and our records do not show the use to which such conductor is put by the customer.
(3) Prior to 1954, no records of sales by state and Canada are available. Aluminum Company of America's total sales for 1948, 1950 and 1952 are as follows:

	1948		1950		1952	
	Pounds (Thousands)	Dollars (Thousands)	Pounds (Thousands)	Dollars (Thousands)	Pounds (Thousands)	Dollars (Thousands)
(2) Open wire (covered for distribution)	0	0	0	0	202	175
((3) Open wire (bare for distribution))	63,450	20,882	65,018	23,504	81,690	31,914
((4) Open wire (bare for transmission))						
(5) Service drop cable	0	0	0	0	76	85

(4) For 1954, records are slightly incomplete, and 103,000# and $77,000 of the total sales for open wire (covered for distribution), and 1,639,000# and $1,506,000 of the total sales for open wire (bare for distribution and transmission) cannot be identified by territory.
(5) ( ) denotes credit resulting from cases where customers' returns and adjustments exceed shipments in a given territory and year.

[fol. 4681] Question 6 (continued)

With respect to each of the following categories, give for each of the years 1948, 1950, 1952, 1954, 1956 and 1958 * * * (b) estimates of Alcoa's percentage of the total industry sales as determined or compiled by company, industry, associations, or other private or public studies or surveys:

(1) Aerial Cable

(2) Open Wire (covered for distribution)

(3) Open Wire (bare for distribution)

(4) Open Wire (bare for transmission)

(5) Service Drop Cable

(6) Service Entrance Cable

Answer: Other than for the year 1954, data are not available for total industry sales classified under the above categories. Further, Alcoa does not produce and has not produced either Aerial Cable (1) or Service Entrance Cable (6). Percentages given for 1954 are based on the Census of Manufactures data for dollar sales, adjusted to reflect those errors of Alcoa and Rome in reporting to Census that are shown in Alcoa's answer to Questions 4 and 5 of its questionnaire of August 19, 1959, and Rome's answer to Questions 8 and 9 of its questionnaire of August 18, 1959.

Category Number	Category and Census Code Numbers Included	Alcoa's Percentage of Industry Sales for 1954 (dollar value)
(2)	Open Wire (covered for distribution) Census Code Numbers 36312-31, 36312-35 and 36312-37	1.37
(3) & (4)	Open Wire (bare for distribution) and Open Wire (bare for transmission) Census Code Numbers 33923-11, 33923-51, 33923-71, 33922-11 and 34892-61	11.87
(5)	Service Drop Cable Census Code Numbers 33612-44 and 33612-45	2.21

[fol. 4682] Question 7

Specify the extent to which each of the products listed in response to 4 and 5 above are included in each of the categories listed above in 6.

Products Listed in Questions 4 and 5	Relationship to Question 6
Aluminum Rod and Bar, Rolled and Continuous Cast—Code 33522-11-9	Not included
Bare Wire, Conductor—Code 33922-11-1	Not included
Aluminum Cable, Steel Reinforced and Other Bare Aluminum Cable—Code 34892-61-1	All Covered in Items (3) and (4)
Thermoplastic Covered—Code 36312-35 (1954 Census only)	All Covered in Item (2)
Polychloroprene Covered—Code 36312-37-5	All Covered in Item (2)
Other (including Thermoplastic Covered) Code 36312-39-1 (1958 Census only)	All Covered in Item (2)
Thermoplastic Insulated—Code 36312-45-0 and Rubber—Code 36312-44-7 (Reported in error as Service Entrance Cable—Code 36312-46-3)	All Covered in Item (5)
Thermoplastic Covered—Code 36312-35 and Polychloroprene Covered—Code 36312-37-5 (Reported in error as Unclassified—Code 36312-98)	All Covered in Item (2)

[fol. 4683] Question 8

(a) List the machinery and equipment for the manufacture of rod which can be used interchangeably in the manufacture of aluminum E. C. Redraw Rod and copper rod.

Answer: Alcoa has no such machinery or equipment.

(b) To the extent that machinery or equipment for the manufacture of rod cannot be used interchangeably, please explain what steps would be necessary, including the economic factors involved.

(1) to convert machinery or equipment for the making of aluminum E. C. Redraw Rod to machinery or equipment for the making of copper rod,

(2) to convert machinery or equipment for the making of copper rod to machinery or equipment for the making of aluminum E. C. Redraw Rod and

(3) to convert machinery or equipment to make both aluminum E. C. Redraw Rod and copper rod,

Answer: (b)(1) The following steps would be necessary to convert the continuous rod rolling mill at Massena to equipment for the making of copper rod:

Installation of four (4) preheat furnaces, including conveyors, and revisions of building to accommodate such furnaces

Installation of high pressure descaling and cooling sys-
[fol. 4684] tem, one (1) Dorr Thickener for recovery of copper scale fines, pickling system for descaling coils, water quench for cooling coils prior to pickling, and pickling solution reclamation system
Cleaning of existing soluble oil system
Replacing zinc-lined tubes and coiling pans

The steps that would be necessary to convert the rod mill at Vancouver to equipment for the making of copper rod would be the same except that three (3) rather than four (4) preheat furnaces would be required, a new set of rolls would be required, and replacement of zinc-lined tubes and coiling pans would not be necessary.

With respect to both such mills, the cost of such conversion would be substantial and would result in lower production. The cost and results obtained would be so disparate as to be uneconomic.

(b)(2) Alcoa has no equipment or machinery for the making of copper rod.

(b)(3) To convert the continuous rod rolling mill at Massena and the rod mill at Vancouver so as to make both aluminum E. C. Redraw Rod and copper rod would require, in addition to the steps described in the answer to subdivision (b)(1) of this question, a revision of the soluble oil system in each mill so as to permit it to be sealed off from the copper coolant system, and additional coil storage space at Vancouver. Not only would the conversion be uneconomic for the reasons stated in the answer to subdivision (b)(1) of this question, but in addition interchangeability of these mills between copper and aluminum would be completely impractical due to the difficulty of cleaning up the rolling mill and coolant system. Any copper oxide scale contamination of the soluble oil coolant used for aluminum rolling would lead to the production of poor quality aluminum rod and in turn aluminum flake contamination of the water coolant used for copper rolling would lead to poor quality copper rods.

[fol. 4685] Question 9

(a) List the machinery and equipment for the manufacture of wire and cable which can be used interchangeably

in the manufacture of aluminum wire and cable and the manufacture of copper and wire and cable.

Answer: The following stranding equipment:

20 tubular stranders
6 rigid frame stranders
5 planetary stranders
2 rewind and repair lines

The following insulating and cabling equipment:

1 rewind and repair line
1 electrical test tank
1 bunch strander
1 4½" plastic extruder
1 cable twister

(b) To the extent that machinery or equipment for the manufacture of wire or cable cannot be used interchangeably, please explain what steps would be necessary, including the economic factors involved,

(1) to convert machinery or equipment for the making of aluminum wire and cable to machinery or equipment for the making of copper wire and cable.

(2) to convert machinery or equipment for the making of copper wire and cable to machinery or equipment for the making of aluminum wire and cable, and

(3) to convert machinery or equipment to make both aluminum wire and cable and copper wire and cable.

[fol. 4686] Answer: (b)(1) The following steps would be necessary to convert wire-drawing equipment for the making of aluminum wire to equipment for the making of copper wire:

Revisions to 1 fine wire and 20 breakdown machines.
Replacement of 20 electric rod welders with welders having double capacity
Installation of 3 water-seal and 9 electric-bell annealing furnaces for bright copper anneal, including additional floor space for the furnaces
Clean-up machines and lubricant systems
Wire-drawing capacity, on a footage basis, would be lost since the speed of drawing copper on such equipment would be one-half that of drawing aluminum.

(b)(2) Alcoa has no machinery or equipment for the making of copper wire or cable except that which, as noted in the answer to subdivision (b)(1) of this question, may be used interchangeably in making aluminum and copper wire.

(b)(3) To convert wire-drawing equipment to make both aluminum wire and copper wire would require the steps described in the answer to subdivision (b)(1) of this question plus the supplying of separate lubricating systems and necessary valving at the wire-drawing machines, and there would be the same loss of wire-drawing capacity on a footage basis since the speed for copper would be only one-half of that for aluminum.

[fol. 4687] Question 10

Describe the changes, if any, in Alcoa's or Rome's production facilities and marketing organization which have been made since March 31, 1959, and the changes which are contemplated.

Answer: The changes are described in the answer of Rome Cable Corporation to Question 17 in the list of questions submitted to that corporation under date of August 18, 1959.

[fol. 4688] Question 11

List the names and addresses of customers common to both Rome and Alcoa in the sale of rod, wire or cable during each of the years 1957 and 1958, and the first three months of 1959, classifying the rod, wire and cable products sold to each such customer by Rome, Alcoa or both.

Answer: This information is correctly given in the answer of Rome Cable Corporation to Question 18 in the list of questions submitted to that corporation under date of August 18, 1959.

[fol. 4689] Question 12

Submit copies of all contracts or agreements between Rome and Alcoa providing for the manufacture by Rome of insulated conductor for Alcoa on conductor furnished by Alcoa.

Answer: These are submitted with the answer of Rome Cable Corporation to Question 19 in the list of questions

submitted to that corporation under date of August 18, 1959.

[fol. 4690] Question 13

(a) List the names of companies, other than Rome, which performed, during the period from January 1, 1953 to date, insulation work on aluminum conductor supplied by Alcoa, whether pursuant to contract or otherwise.

(b) For each such company, give the amount paid by Alcoa for such work during each of the years 1953 through 1958 and each quarterly period of 1959, and describe the arrangements under which such work was performed.

Answer: (a) and (b) The only such company was Rea Magnet Wire Company, Inc., which has performed such work pursuant to a letter agreement dated August 20, 1958, a copy of which is submitted herewith. Payments by Alcoa to Rea Magnet Wire Company, Inc. for such work were as follows:

1958	$ 2,994.19
First Quarter 1959	
Second Quarter 1959	16,170.86

[fol. 4690a] Question 14

Please submit

(a) All market, industry and company surveys, studies or reports made or considered in anticipation of, or in connection with, the acquisition of Rome or any other manufacturer of rod, wire or cable.

(b) All correspondence, memoranda, surveys, studies, reports and recommendations received from or sent to Ebasco Services Incorporated in connection with the proposed acquisition of Rome by Alcoa.

(c) All market, industry and company surveys or reports concerning competition, actual or potential, between aluminum and copper wire and cable.

Answer: (a) There were no such surveys, studies or reports.

(b) Reference is made to the letter dated January 2, 1959 from R. L. Schlesinger, Ebasco Services, Inc., to R. V. Davies, submitted in answer to Question 1 of the Depart-

ment of Justice letter of February 2, 1959, and there is submitted herewith a copy of a letter dated November 7, 1958 from R. L. Schlesinger to Ralph V. Davies.

(c) There is submitted herewith a copy of a report prepared by Alcoa's Commercial Research Division, dated July 25, 1957, entitled "Magnet Wire."

[fol. 4690b] Question 15

Question 6 of our letter of February 2, 1959, requested the names and locations of "all" companies from whom stock or assets were acquired within the last ten years by Alcoa and by Rome. Your response, however, gives only acquisitions by Alcoa "which relate to the business conducted by Rome." We would appreciate a list of all Alcoa acquisitions and mergers in the last ten years.

Answer: All Alcoa mergers or acquisitions in the last ten years of all or substantially all of the capital stock or assets are as follows:

All the capital stock of Columbia River Orchards, Inc., acquired in 1957. This company was engaged in the fruit-growing business at Wenatchee, Washington, in the vicinity of the company's Wenatchee Works.

All the capital stock of Rockdale, Sandow & Southern Railroad Company, acquired in 1951. This is a railroad company operating between Marjorie and Sandow, Texas, at the company's Rockdale Works.

Substantially all of the assets of Dillsboro and Sylva Electric Light Company, acquired in 1957. This company, which was capable of producing only 225 Kw and was in financial difficulty, was engaged in the distribution, as a public utility, of electric power in the vicinity of Dillsboro, North Carolina, near the company's Alcoa Works in Tennessee.

[fol. 4691] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 41

Internal Correspondence

January 18, 1960

From:
Leon E. Hickman,
Pittsburgh Office.

To: ——

Alcoa has this day purchased the assets of Rea Magnet Wire Company, Inc. The Rea Company has plants at Fort Wayne and Lafayette, Indiana. The company specializes in the manufaeture of smaller sizes of magnet wire, a product used in coil windings, transformers, motors and other electrical and electronic equipment. It is hoped that Rea, in affiliation with Alcoa, will bring aluminum wire into a number of these markets.

I attach a copy of a statement made to the Rea Company concerning Alcoa's proposed policies in the operation of the company.

Leon E. Hickman.

[fol. 4692] Aluminum Company of America

1501 Alcoa Building
Pittsburgh 19, Pa.

January 15, 1960.

Mr. Samuel A. Rea,
Chairman of the Board,
Rea Magnet Wire Company, Inc.,
Fort Wayne, Indiana.

Dear Sam:

If the stockholders of Rea Magnet Wire Company, Inc., approve the sale of your company to Alcoa, the most challenging opportunity confronting us both is how to utilize your people to the best advantage. Plants and technology are only significant in the hands of the right people. When we were last together, we spent more time on this subject than any other. We in Alcoa have continued to give it a top priority in our thinking because, above all else, we want to maintain the high esprit de corps of the Rea organization and to open to every man and woman in your company improved opportunities under the new program. You are free to tell your people that our thinking is running along the following lines:

(1) *All manufacturing and selling activities of Rea Magnet Wire Company, Inc., now conducted in Fort Wayne and Lafayette, Indiana, will be continued in those locations.* We already operate aluminum fabricating plants in Lafayette and Richmond and in July, 1960 will open the finest aluminum smelter in the world at Warrick, Indiana. Our experience in Indiana has been outstanding and, with your plants combined with ours, Indiana becomes a major manufacturing center for Alcoa.

(2) *A new corporation, likewise to be known as Rea Magnet Wire Company, Inc., will be formed to take over the properties of the present Rea Company.* Its Board of Directors will consist of a small number of Rea and Alcoa officers selected with an eye to a functional coordination of activities. You and the other officers of Rea will be expected to manage the new company, as you have the old, with only such changes in titles and functions as you have recommended to us or as time and changing circumstances ulti-

mately indicate to be in our common interest. Likewise, the rest of your organization will be carried over intact into the new company.

[fol. 4693] (3) *Wages and benefits.* We agree with you that you should continue your present policies with respect to salaries and wage rates of hourly employees and that you should continue your existing employee benefit plans, including profit sharing. However, should the new company ever be required to negotiate with a union on such matters, the new company can make no commitment as to the continuation of these benefits under those conditions.

(4) *We expect the new company to assume leadership in the development and utilization of aluminum magnet wire.* While we have no intention of minimizing your operations in copper magnet wire, we do anticipate that your experience in the magnet wire field and our know-how in the properties of aluminum can be combined through aggressive research into leadership in the development and utilization of aluminum magnet wire in those applications where aluminum is equal or superior to copper.

(5) *Research.* Both Rea and Alcoa are research-minded. We expect the new company to continue its research activities, indeed to expand them, but also to make full use of the research staff and facilities of Alcoa by coordinating programs.

(6) *We expect the new company to continue the present sales organization and policies of Rea, subject only to such modifications as experience may show to be in the common interest.* It is hoped that the Alcoa and Rea selling organizations can support each other and coordinate activities to their mutual benefit.

(7) *Purchasing.* We anticipate that the purchasing activities of the new company, particularly in copper, will be handled through its own organization, but in coordination with Alcoa purchases in the same or related fields.

(8) *The new company will operate functionally as a Division of Alcoa.* It will have full responsibility for the manufacture and sale of the products presently manufactured by the Rea Company and such others as may be appropriate to its activities. As a Division of Alcoa, Rea will draw upon Alcoa for such help as Rea may desire and [fol. 4694] Alcoa may have available, whether it be in the

field of research, manufacturing or engineering know-how, selling experience, customer contacts, or staff services of any of the numerous kinds made available in Alcoa. It is our intention to give the new Rea organization autonomy and authority commensurate with its responsibilities and to depend upon the good judgment of the Rea organization to make full use of the strength available through affiliation with Alcoa.

(9) *Modifications in the light of experience.* I am sure you realize that, while we speak in complete candor and good faith, these policies must always be subject to modification or change as experience may dictate. A rigid commitment on any of these points would be no more in your interest than in ours. For example, tax considerations may ultimately make it advisable to liquidate the new company into Alcoa and thereafter operate it simply as one of the Divisions of the parent company. Some of your people are quite likely to find additional opportunities for advancement in the Alcoa organization. No decision can be reached now as to where it would be advisable to manufacture new products or supplement the production of existing items.

There is an element of faith in this, as in all worthwhile matters. If we did not share that faith, we would not have offered your company this affiliation with Alcoa, nor would your Board have recommended its acceptance to your stockholders. We are counting on your people, strengthened by the support that Alcoa can give them, to develop the magnet wire business of Rea, both in copper and aluminum, well beyond its present potential. We can go far together if we maintain a mutual confidence and a willingness to adapt our program to changing circumstances. Subject only to those inevitable contingencies, this letter expresses our full thinking to date.

And I may say that we welcome you and every man and woman in the Rea organization into the Alcoa family with genuine enthusiasm and a confidence that we shall do well in partnership.

With cordial regards, I am

Sincerely, Leon E. Hickman, Executive Vice President.

Rea Magnet Wire Company, Inc.
East Pontiac Street
Fort Wayne, Indiana

January 19, 1960.

To Our Organization:

It is a pleasure to be able to inform you of another progressive step in the history of our company, which will benefit each of us and our customers in many ways. Rea Magnet Wire has become a subsidiary of Aluminum Company of America.

Alcoa plans to continue the fundamental policies of our management *and no major changes in personnel or operating procedures are anticipated.* We are convinced that the Alcoa management shares our basic attitude toward customers, the community, and company personnel. In short, we expect to operate in the future very much as we have in the past.

Alcoa is an integrated producer of aluminum and a fabricator of aluminum products. It has pioneered in the use of aluminum as an electrical conductor and has developed new aluminum products and processes for the electrical industry. Its principal electrical product in Aluminum Cable Steel Reinforced (ACSR) used in power transmission lines. Rome Cable Corporation, a subsidiary of Alcoa, produces copper rods and bar and insulated wires and cables. It sells primarily to utilities, the construction industry, large equipment manufacturers, mines and refineries. As you know, we sell principally to manufacturers of smaller electrical components such as coil windings, transformers, motors, meters and the like.

Alcoa maintains one of the country's foremost research organizations. With the help of their labs, we expect to intensify our efforts to develop new products and money saving machinery for our customers.

Enclosed is a copy of a letter from Mr. L. B. Hickman, Executive Vice President of Alcoa, which outlines the basic principles which we have agreed should guide our opera-

tions in cooperation with Alcoa. Additional letters from time to time will deal with other aspects of this new partnership. Meanwhile we can pitch in on our respective jobs with the assurance that our possibilities, both as a company and as individuals, have been much improved.

I would be happy to answer any questions you might have about this new development.

Sam Rea.

[fol. 4696] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 44

Question A

Rea's total volume of sales in 1958 and 1959

Answer

1958	$18,446,591
1959	24,906,249

[fol. 4697] Question B

List of products made by Rea and dollar volume of sales therefor in 1958 and 1959.

Answer

The products made by Rea in 1958 and 1959, together with the dollar volume of sales therefor, are as follows:

	1958	1959
1. Round magnet wire, film insulated	$18,404,053	$24,984,596
2. Hard bare wire	38,602	11,653
3. Aluminum alloy film coated wire supplied for developmental purposes as guide wire for Army missiles	3,936	—

[fol. 4698] Question C

Total value of shipments including interplant transfers of magnet wire in 1954 and 1958 broken down into product categories as reported to Census of Manufactures and corresponding data for 1959.

Answer

1954—Magnet Wire, Code 3631221	$14,311,322
1958—Magnet Wire, Code 38312 20 3	17,651,000
1959—	24,085,000

Note: The amount for 1954 should have read $14,311,222. Erroneously included in the above figures were cotton wrapped enameled magnet wire, hard bare wire and missile guidance wire (defined in answer to Question A).

[fol. 4699] Question D

Amount of aluminum compared to copper magnet wire products made and sold in 1954, 1958 and 1959.

Answer

	1954	1958	1959
Copper, pounds	22,366,683	26,568,524	32,619,352
Aluminum, pounds	none	929	6,592

Note: Aluminum magnet wire was produced and sold by Rea on a toll and agency arrangement with Alcoa.

PLAINTIFF'S EXHIBIT 47

Report to Stockholders of Rome Cable Corporation
as of March 31, 1937

[fol. 4701] Rome Cable Corporation
Rome, N. Y.

To the Stockholders:

Your Company was incorporated on January 20, 1936 and started to do business about April 1, 1936. Actual manufacturing operations began, in our bare wire and weatherproof departments, approximately July 1, 1936 and all of the departments were under way by the end of 1936. The accompanying income account thus presents the results of our operations for a twelve-month period dating approximately from the time the Company commenced doing business.

There is presented herewith financial statements of your Company as of March 31, 1937 and a certificate of our auditors, Ernst & Ernst. As shown therein, net profit from manufacturing operations amounted to $48,982.24 which, after absorbing pre-production expenses incurred prior to July 1, 1936 of $47,366.00, leaves a balance of $1,616.24 carried to earned surplus at March 31, 1937.

The quarterly operating results since July 1, 1936 to March 31, 1937 were as follows:

From July 1, 1936 to September 30, 1936	(Loss)	$14,910.38
From October 1, 1936 to December 31, 1936	(Profit)	11,191.49
From January 1, 1937 to March 31, 1937	(Profit)	52,701.13
Total net operating profit for period		$48,982.24

As stockholders were previously advised, in considering these figures it should be remembered that few departments were in complete operation during all of those periods and, further, that during this time the Company absorbed the burden and expense of beginning production and perfecting its organization.

In connection with the preparation of our financial statements, special consideration has been given to the basis of inventory valuation by reason of the wide fluctuations in basic commodity prices which have occurred during recent months. In order to avoid including unrealized inventory profits in our financial statements, the Company has adopted the conservative policy of inventory valuation which is fully described in the accompanying auditors' report.

We have made it a practice to immediately purchase all necessary raw materials to cover orders placed with us by customers. As of March 31st we had a small surplus of copper purchased over and above commitments to customers at an average price of less than the present market price.

Deliveries of certain items of equipment to complete various departments have been considerably delayed, but we anticipate our plant operations will approach the level projected some time during the April/June quarter.

We are comfortably booked with business for the next several weeks of operation and we are hopeful that the present price of copper will induce buying in the near future.

Recent remarks of several executives of large utility companies indicate that further expansion in their facilities cannot long be delayed, and it seems highly probable that the utilities and electrical manufacturers will place additional business in the near future unless further unwise legislation or unforeseen events seriously affect the rising tide of business generally.

We are keeping in step with the present trend of increasing rates of pay of all employees and while this has a natural tendency of increasing costs of production, yet this is being largely offset by the loyal co-operation of our entire organization in greater efficiency of operation.

By Order of the Board of Directors.
H. T. Dyett, *President.*

May 3, 1937.

Total Surplus March 31, 1937			$815,943.60

* The Company was organized on January 20, 1936, but did not commence business until about April 1, 1936. Manufacturing operations were commenced in certain departments about July 1, 1936.

Rome Cable Corporation,
Rome, N. Y.

We have made an examination of the balance sheet of Rome Cable Corporation, Rome, N. Y., as at March 31, 1937, and of the statement of income and surplus for the period from organization of the Company in 1936 to March 31, 1937. In connection therewith we examined or tested accounting records of the Company and other supporting evidence, and obtained information and explanations from officers and employees of the Company; we also made a general review of the accounting methods and of the operating and income accounts for the year, but we did not make a detailed audit of the transactions.

The inventories, which were taken and certified to us by the management, were test checked as to the accuracy of the computations and reviewed as to the method of pricing. Values used represent the lower of cost or market at March 31, 1937. In respect to basic materials cost is determined on the principle of "last-in first-out", i.e., by charging during each month the cost of purchases of basic material received and taken into inventories against the equivalent amount of such material contained in finished product shipped to customers during that month. The excess quantity, if any, of such shipments over receipts is charged with its pro-rata share of the book value of remaining receipts most recently added to inventories. The excess quantity, if any, of receipts over shipments is added to inventories at cost of such purchases.

At March 31, 1937, the Company had purchase commitments for additional plant equipment and for the major raw material requirements of its sales orders at prices not in excess of those prevailing at that date.

In our opinion, based upon the foregoing, the accompanying balance sheet and related statements of income and surplus fairly present the financial position of Rome Cable Corporation as at March 31, 1937, and the results of its our opinion that the statements have been prepared in accordance with accepted accounting principles.

Ernst & Ernst.

Alcoa Annual Report 1959

[fols. 4710-4712] To the Shareholders of ALCOA

Alcoa's sales and earnings turned upward in 1959, keeping pace with the general recovery from the 1958 recession.

During the first half of the year, Alcoa's volume of aluminum shipments increased rapidly and reached the proportions of a peacetime record for the month of July. In August and September, however, incoming orders and shipping releases dropped abruptly, partially because of high inventories accumulated by customers in anticipation of a strike in the aluminum industry, and partially because the manufacture of many products using both aluminum and steel was necessarily curtailed when the steel strike occurred. The upward trend in business was not resumed until late in the fourth quarter.

Despite the wide fluctuation in demand during the year, the consumption of aluminum, as measured by the aluminum industry's shipments, evidenced an increase of 20 per cent over the previous record peak of 1956. At the year's end, customer inventories of aluminum apparently remained unusually high, a fact which still reflected the "strike buying" of the first and second quarters. The present outlook is for continued expansion of aluminum markets this year.

Foreign and domestic competition again was intense, adversely affecting prices and earnings. By December 17, 1959, however, your company was able to restore the price of primary aluminum pig to 26 cents. The increase of 1.3 cents per pound on that date, together with a 0.7 cents per pound increase on August 1, 1958, simply brought the price of aluminum back to its level of August 1, 1957.

During 1959, Alcoa carried on a broad, vigorous program to foster and take advantage of both new and growing markets. Research and development again resulted in new products, and in new and improved methods of production. Availability of increased smelting capacity was assured with resumption of construction at the Warrick smelter, near Evansville, Ind., which is expected to begin production by July, 1960. Sales, advertising and publicity efforts stimulated new uses for aluminum and gave increased impetus to existing applications. Foreign market opportunities for Alcoa were widened by agreements establishing affiliated

fabricating companies in Great Britain, Japan, Venezuela and Mexico.

In the domestic market, Alcoa took steps to provide more complete service to the electrical and architectural industries by acquiring three new subsidiaries. The principal objective of these new affiliations is to stimulate increased use of aluminum in the electrical and architectural fields.

The acquisition of Rome Cable Corporation, discussed in the Annual Report for 1958, was approved by Rome's shareholders. On March 31, 1959, the assets of Rome were transferred to Alcoa in exchange for 355,226 shares of common stock of Alcoa and the assumption by Alcoa of the obligations of Rome.

On January 19, 1960, 180,480 shares of Alcoa common stock were issued to Rea Magnet Wire Company, Inc., for the assets of that company and the assumption by Alcoa of the obligations of Rea. Rea manufactures copper magnet wire for use in electrical and electronic equipment, employing 770 people at two manufacturing plants in Fort Wayne and Lafayette, Ind.

On January 23, 1960, 64,209 shares of Alcoa common stock were issued to the shareholders of Cupples Products Corporation in exchange for all outstanding shares of that company. Cupples fabricates, sells, erects and installs aluminum in architectural applications. It employs 880 people at plants in St. Louis, Mo.; Dallas, Tex.; and Dowagiac, Mich.

The directors and officers of Alcoa wish to express their sincere appreciation to the men and women of the company whose efforts have been responsible for the progress noted in 1959, and whose initiative and enterprise are so essential to Alcoa's future success.

I. W. Wilson, Chairman of the Board, Frank L. Magee, President.

1501 Alcoa Building, Pittsburgh 19, Pennsylvania, March 1, 1960.

Annual Meeting: The annual meeting of shareholders of Aluminum Company of America will be held on Thursday, April 21, 1960, at 10:00 a.m., E.S.T., in Ballroom Number One, The Pittsburgh Hilton Hotel, Pittsburgh, Pa.

• • • • • • •

[fol. 4713] Electrical

The electrical market for aluminum showed significant gains during 1959, with particular progress noted in aluminum bus bar and conductor for industrial buildings, conductor for utility service lines and utility substation structures. The use of aluminum conduit also increased as intensive sales efforts projected this product into a field long dominated by other materials.

With the acquisition of Rome Cable Corporation, Alcoa's position in the electrical wire and cable market was strengthened and diversified. Rome's bare and insulated conductor, [fols. 4714-4737] conduit, and cable supporting systems have been added to Alcoa's popular line of electrical products, thereby permitting the company to broaden its service to the electrical and other industries. Rome's facilities and techniques for the further commercial and technical development of insulated aluminum conductors should result in new and wider uses of aluminum in the utility, construction and missile industries. Distribution of these products is now handled primarily by Rome Cable Corporation, a wholly owned subsidiary of Alcoa.

ANNUAL REPORT 1960

To the Shareholders of Alcoa

Difficult market conditions throughout the metals industry during 1960 extended to aluminum and were reflected in the results of the year's operations for Alcoa. Gross revenues of the company were slightly higher than those recorded in 1959, but problems common to the aluminum industry generally caused earnings to be disappointingly low.

The most important single element contributing to the low earnings was the depressed price situation with respect to fabricated products. The general deterioration of prices throughout the industry resulted from many factors, including an excessive amount of unused aluminum fabricating capacity, and the continued importation of aluminum products to a market already amply supplied.

In addition to the unsatisfactory price levels, earnings were also unfavorably affected by the reduced pace of the nation's economy, accentuated in our industry because of the accumulation by consumers during 1959 of aluminum mill and end product inventories. This condition adversely affected the volume of shipments in 1960. Carrying charges on idle facilities, extending from refining through the smelting and fabricating operations, also contributed to the decline in earnings, as did higher labor costs of recent years which were only partly offset by price increases.

On the other hand, aggressive new market promotions by Alcoa and the pattern of sales in certain areas of aluminum consumption justify a feeling of optimism and an expectancy of the return of business to more profitable levels. There is evidence that inventories in many lines have been considerably reduced. With any improvement in general economic conditions, there is every reason to expect that per capita consumption of aluminum will resume its growth in the United States and continue its upward movement in foreign markets. The current decade should be a period of great progress.

As a part of the company's continuing effort to reduce costs, studies are being made of the company's activities and the contribution that each makes to Alcoa's profit and development and, where indicated, vigorous steps are being taken to increase the operating efficiencies in all departments.

In the field of capital expenditures, prudent planning dictates that Alcoa must be prepared to meet the anticipated changing pattern of demand. At the same time, current conditions require that your management exercise great care in evaluating each proposed new expenditure, initiating only those which promise the most immediate gain.

At its December meeting, the Board of Directors adopted a comprehensive, company-wide program to insure that officers and employees would be free of conflicting interests when dealing with third parties on behalf of the company.

For all the directors and officers we extend sincere thanks to the men and women of Alcoa for their loyalty and devoted efforts in meeting the difficult problems of 1960.

FRANK L. MAGEE, *Chairman of the Board*

Alcoa Aluminum "From Mine to Market" Operating Locations (Insert)
Wholly Owned Subsidiaries (Inside back cover)

ANNUAL MEETING: The annual meeting of the shareholders of Aluminum Company of America will be held on Thursday, April 20, 1961, at 10:00 a.m., E.S.T., in Ballroom Number One, The Pittsburgh Hilton Hotel, Pittsburgh, Pa.

[fol. 4742]

MARKETS

Although an excessive amount of unused fabricating capacity and keen competition kept prices and profits low, there were encouraging indications of progress in major markets, as described on the following pages.

The distribution of Alcoa aluminum products to industries was as follows: building and construction, 24%; transportation, 20%; electrical equipment, 10%; consumer durables, 13%; industrial machinery, 6%; containers and packaging, 8%; all others, including exports, 19%. These figures reflect estimated percentages for distributors and jobbers as well as shipments for further conversion.

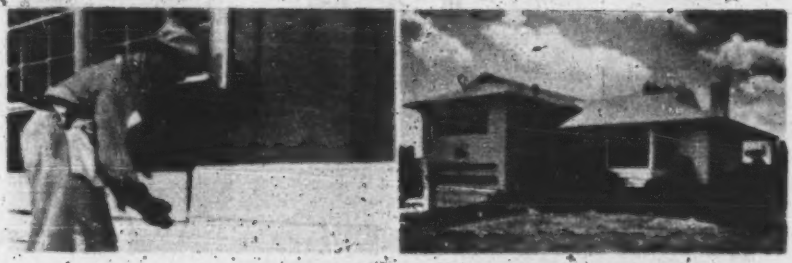
Building and Construction

The building and construction industry was the largest single market for aluminum in 1960. A number of new architectural products were announced and projects were undertaken which are expected to increase Alcoa's participation in this market.

For residential applications, an eight-inch, clapboard-type siding introduced by Alcoa in 1959 was supplemented during 1960 with vertical siding and a new clapboard-type siding of four-inch width. All three products have proved popular with both builders

These striking Colonnade Park Apartments in Newark, N. J., feature aluminum curtain walls fabricated and erected by Cupples Products Division of Alcoa.

[fol. 4743]



Alcoa Siding, available in three styles and ten colors, offers a high-quality building product which is ideal for refacing old homes as well as for new home construction.

and homeowners. Alcoa Siding with foamed polystyrene and aluminum foil insulation complies with the standards set forth by the Federal Housing Administration for home improvement and new construction.

In a further effort to promote the use of aluminum as a building material in locations and projects which will command attention, Alcoa has joined with Webb & Knapp, Inc., in purchasing the 260-acre studio tract of Twentieth Century Fox Film Corporation in the heart of West Los Angeles and in developing a self-contained community of high-rise apartment houses and office buildings on this property. The project, to be known as Century City, offers an unprecedented opportunity to use aluminum in a wide variety of architectural applications.

A similar joint venture has been undertaken with the same company on an entire city block immediately to the north of the United Nations' headquarters in New York City. It is planned to build on this property a high-rise aluminum and glass building which includes both office space and apartments of the luxury type. Here again, the modern architectural uses of aluminum will be dramatized in an effective setting.

Other Alcoa developments for the building and construction industry include the following products:

Alcoa Batten Roof—a walk-aluminum roof with a combined leakproof anchoring and gutter system for use on structures with large roof areas. This product is especially adapted for use on commercial and industrial buildings.

Alshade—a new die-cast aluminum grille for architectural purposes which can be used for both solar shading and decorative effects. Typical uses are for refacing old buildings, providing a design element for new construction and screening gardens and patios.

Architect's model of Century City, a self-contained, [illegible] Los Angeles, Calif., which will be [illegible] showcase for Alcoa aluminum [illegible] applications.

Automotive applications of aluminum continued to grow in 1960. This display [illegible] aluminum engine blocks, radiator grilles, transmission components and wheel assemblies.

Transportation

One of the most important developments in the transportation market in 1960 was the extended use of aluminum in producing engine blocks for 1961 model automobiles. Aluminum engines are now standard equipment on four 1961 model compact cars and optional on four other compact and standard sized domestic models. The use of aluminum engine components, transmission housings and brake drums continues to give automobile manufacturers flexibility of

design. It also makes possible the reduction of dead weight plus improved performance and economy.

Aluminum trim applications showed a sharp increase in 1960 aided by Alcoa's development of a new anodizing process for automotive and appliance parts. The process yields a brilliant finish for aluminum trim and bumper alloys. Aluminum trim utilization will average 10.78 pounds per 1961-model car, the highest poundage for such applications to date and an increase of more than 25 per cent over 1960 models.

Aluminum evaporators and condensers for automobile air-conditioning units are now widely accepted, and an all-aluminum radiator is standard equipment on one popular U. S.-produced sports car. Automotive engineers are evaluating aluminum bumpers for use on production model cars, and alloys developed by Alcoa are expected to hasten their acceptance.

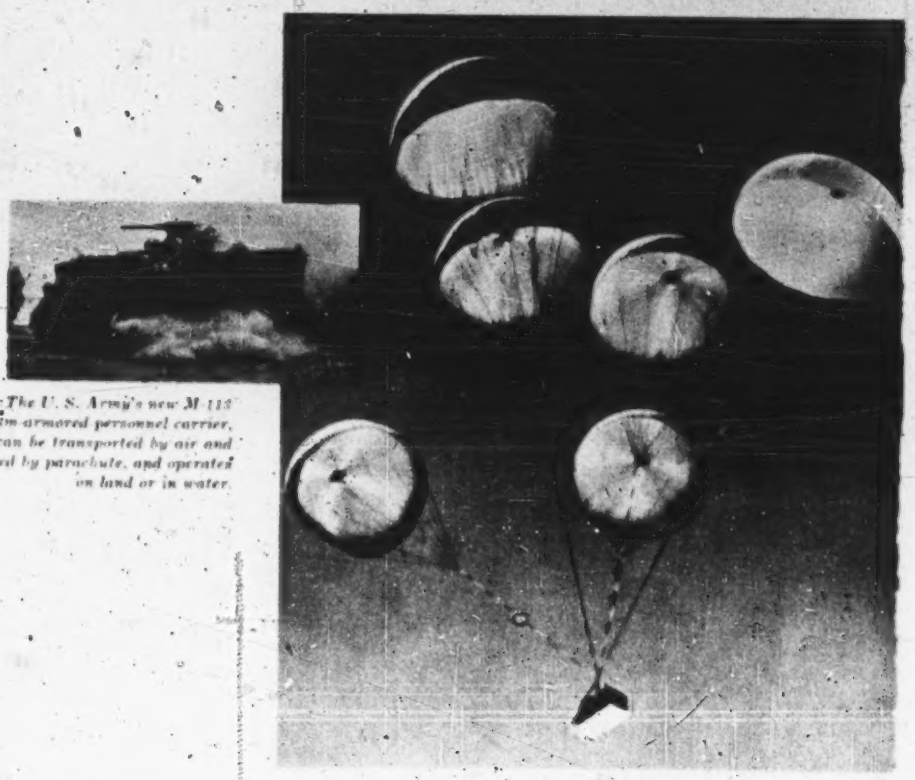
Use of aluminum in the average 1960-model automobile was 34.4 pounds, an increase of 7 per cent over the average of 30.6 pounds in 1959 models. As in past years, aluminum was also widely used in trucks, trailers and buses in such forms as sheet and structural shapes for body construction; extruded sections for flooring; forgings and castings for wheels and various fittings; and screw machine products for fastening.

In the aircraft, marine and railroad fields, aluminum also continued to find important applications. The expanding use of aluminum shipping containers and truck trailers in integrated freight service employing highway, rail and water movement, provides a significant extension to Alcoa's transportation market.

Defense

In cooperation with various government agencies and their contractors, Alcoa entered into a variety of projects in the defense industry. One of these projects was the application of high-strength weldable aluminum sheet as a structural material in the *Saturn* interplanetary space vehicle. In other projects, high-strength aluminum components were used in such applications as rocket motor cases and liquid fuel tanks.

The light weight of aluminum proved especially valuable in the design of military equipment, including armored tanks and airborne equipment that is capable of being dropped by parachute.



The U. S. Army's new M-113 aluminum armored personnel carrier, which can be transported by air and dropped by parachute, and operated on land or in water.

[fol. 4746]

Packaging and Containers

The use of aluminum in packaging and containers became more widespread during 1960 because of its popularity with American housewives. While shipments of foil to converters leveled off somewhat because of heavy inventory buying in 1959, foil was widely employed in flexible wrapping materials, closures and special composite forms called laminates where it was combined with paper, plastics and other materials.

Because of the growing demand for foil bonded or laminated to paper, paperboard and other materials for packaging uses, Alcoa has installed added equipment to produce these materials. Used especially for overwraps and sealed packaging applications, the foil laminates offer both functional and decorative advantages where product freshness and content protection are essential.

Substantial gains were scored during the year in the field of aluminum rigid containers. Alcoa is working closely with can manufacturers who are developing and producing aluminum containers for a variety of products, including motor oil and food products such as citrus concentrates and fish.

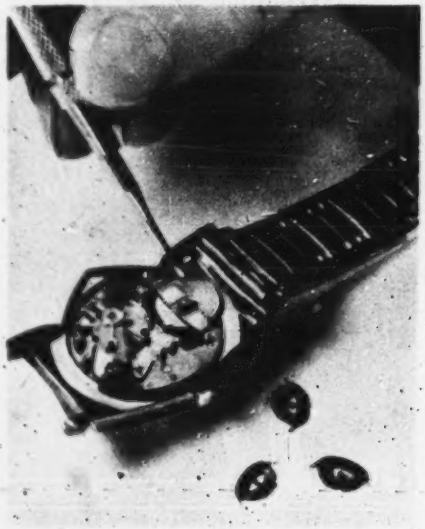
A revolutionary experimental development in this field is an easy-opening end for a new can having a low-cost foil and paperboard body. The container is called Safe-Pack. A test marketing program was successfully carried out during the year and work has begun on the development of a pilot production line.

During 1960, foil was especially popular in the bakery and frozen food fields. Packers and consumers alike have recognized aluminum foil as a superior packaging material for product protection and convenience in preparing and serving food.

Safe-Pack, a container development of 1960, has a foil-paper laminated body and aluminum ends with a quick-opening feature.

Electrical

An especially active field for aluminum in the electrical industry in 1960 was that of developing extra high voltage (EHV) networks employing large-diameter aluminum conductors. These conductors are suit



A coil of hair-thin magnet wire made by Rea Magnet Wire Division of Alcoa is essential to the precision performance of this new electric wrist watch.

[fol. 4747]

able for a power line with 10 times the load capacity of a typical 115,000-volt line. Power companies believe that the use of EHV will permit transmission of maximum flow over minimum rights of way.

Early in the year, Alcoa acquired Rea Magnet Wire Company, Inc., which, though operating independently, is now known as Rea Magnet Wire Division of Alcoa. This acquisition broadened Alcoa's service to the electrical industry and enabled the company to accelerate the use of aluminum sheet and foil strip conductors as well as aluminum magnet wire.

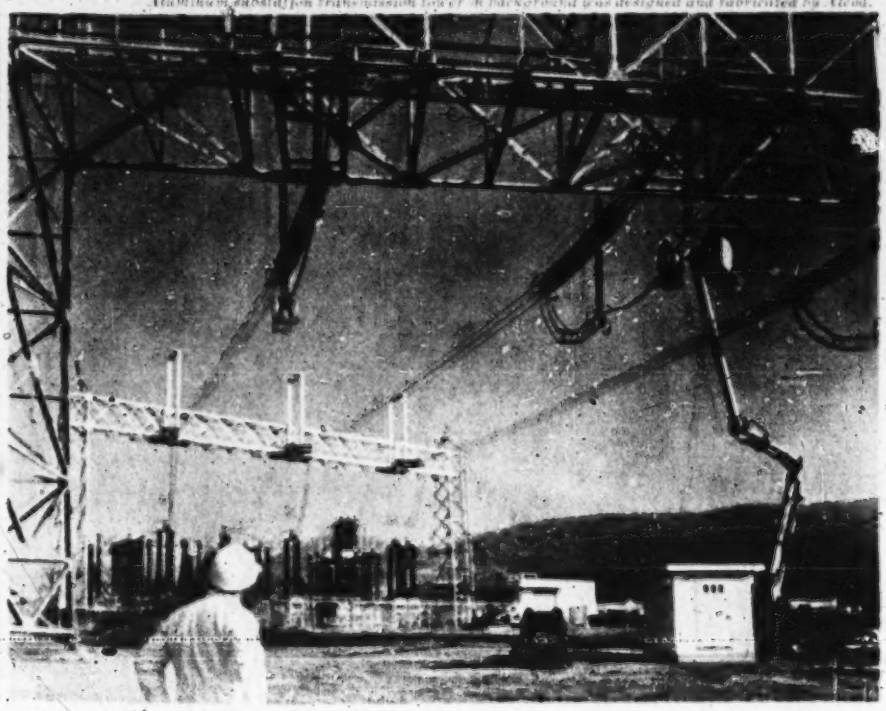
Rome Cable Division of Alcoa, which also operates as an independent subsidiary, now has a special products facility for the custom manufacture of cable products. Located in a new plant in Los Angeles, Calif., the new production unit is intended to serve the electronics market. Instrumentation cable supplied by the Rome Division is playing an important role in missile and rocket electrical systems, ground handling equipment and electronic data processing equipment in military and civilian applications.

Structural

Developments in the use of aluminum for electrical transmission towers are encouraging. Towers in sizes which utilize up to 34,000 pounds each have been designed, fabricated and shipped by Alcoa to utility companies. Several power lines using aluminum towers were completed and energized during 1960, and towers for additional lines are under construction or have been ordered. Aluminum towers have passed rigid tests that proved they fully met service requirements, while offering economy in erection and maintenance costs.

Alcoa's efforts to achieve widespread acceptance of aluminum substation structures in the electrical industry have now been extended to include specialized buildings associated with the chemical and process industries. Aluminum offers outstanding advantages for these applications because of its resistance to chemical corrosion. Alcoa's structural division has special facilities at the company's Cressona, Pa., works location to fabricate these and other structural assemblies.

Experimental EHV (extra high voltage) power line using Alcoa aluminum conductors. Aluminum substation transmission tower in background was designed and fabricated by Alcoa.



A noteworthy aspect of Alcoa's activities in 1957 was the company's continued effort to shorten the time between development of research findings and their profitable application. Through close cooperation between Research and other divisions of the company, working processes were improved and programs were initiated to stimulate new products.

Improved aluminum powders were developed for use as solid fuel propellants for the missile and rocket industry. New tarnishing aluminum pigments were produced that offer bright, attractive, durable coatings for automobile bodies. Methods were devised for preparing colored aluminum powder for use as a pigment in plastics, ink and paints.

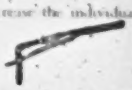
Production lithographic printing on foil, color and five-color presses to produce high quality pictorial designs was accomplished for the first time on aluminum foil because of a special transparent coating developed by Alcoa Research Laboratories. This coating permits the foil surface of a foil-paperboard laminate to be printed by the lithographic process with the same ease as ordinary coated papers.

During the second quarter, the company announced a packaging development laboratory at Morristown, Pa., as a division of the process development laboratories. The new laboratory will supplement the packaging development activities of Alcoa Research Laboratories and the sales development division. Work at the new location is directed toward expanding Alcoa's services to the packaging industry and increasing the use of aluminum flexible packaging, closures and rigid containers, including aluminum cans.

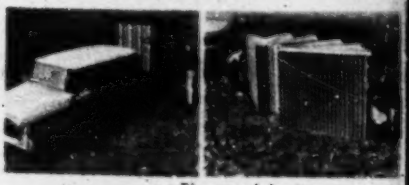
PUBLIC RELATIONS AND ADVERTISING HIGHLIGHTS

Through both advertising and publicity, the company sought to increase the demand for Alcoa products and to create an understanding of Alcoa by all segments of the public.

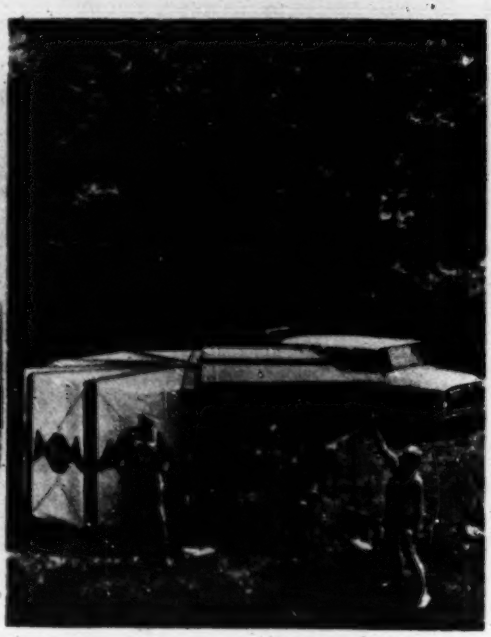
The public affairs program of Alcoa was broadened during the year. More than 2,300 salaried employees at plants and offices completed the Alcoa Course in Practical Politics designed to increase the individual's



Alcoa's mobile x-ray screening unit is a compact camping unit on wheels.



The expanded unit contains twenty sleeping quarters for six people.



employee's active participation in, and understanding of, our political system.

The company continued its aggressive advertising and promotional activities, with particular emphasis on automotive applications and on Alcoa Siding and related residential building products. Television, radio, newspapers, consumer magazines, trade and technical publications, direct mail, motion pictures, exhibits and store displays were used to stimulate demand for our own products and those of our manufacturing customers. The increased use of aluminum in rockets, missiles, lightweight military vehicles, ground handling equipment for missiles and other defense materials prompted a new advertising program designed to capitalize on Alcoa's wide range of experience and facilities in this important market.

FACILITIES

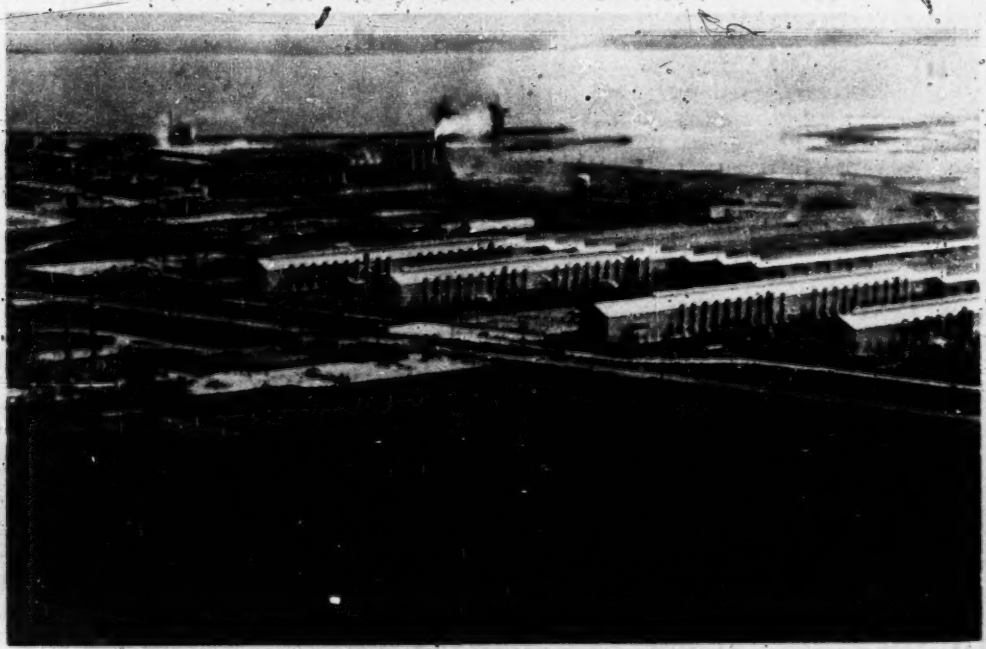
Alcoa's program of cost reduction and product improvement was intensified in 1960. One aspect of this program was the extensive application of computers and other electronic accounting equipment to improve the efficiency of the company's cost and budget control system. At all Alcoa operating locations, every effort was made to ensure that a high level of performance and product quality was maintained.

Raw Materials and Refining

Production of bauxite in the Dominican Republic increased steadily through the efforts of Alcoa Exploration Company. The new refining works at Point Comfort, Tex., includes special equipment for processing Dominican type bauxite.

Alcoa's fourth major source of bauxite was acquired

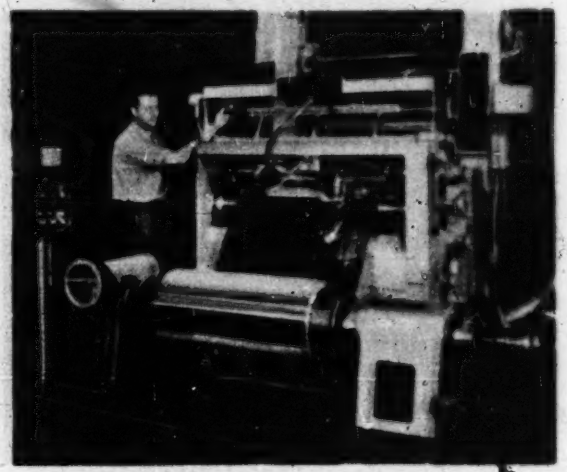
Aerial view of Alcoa's Point Comfort, Tex., operations, which involve both ore-refining and smelting of aluminum. Electric power for this large plant is generated by radial engines burning natural gas.



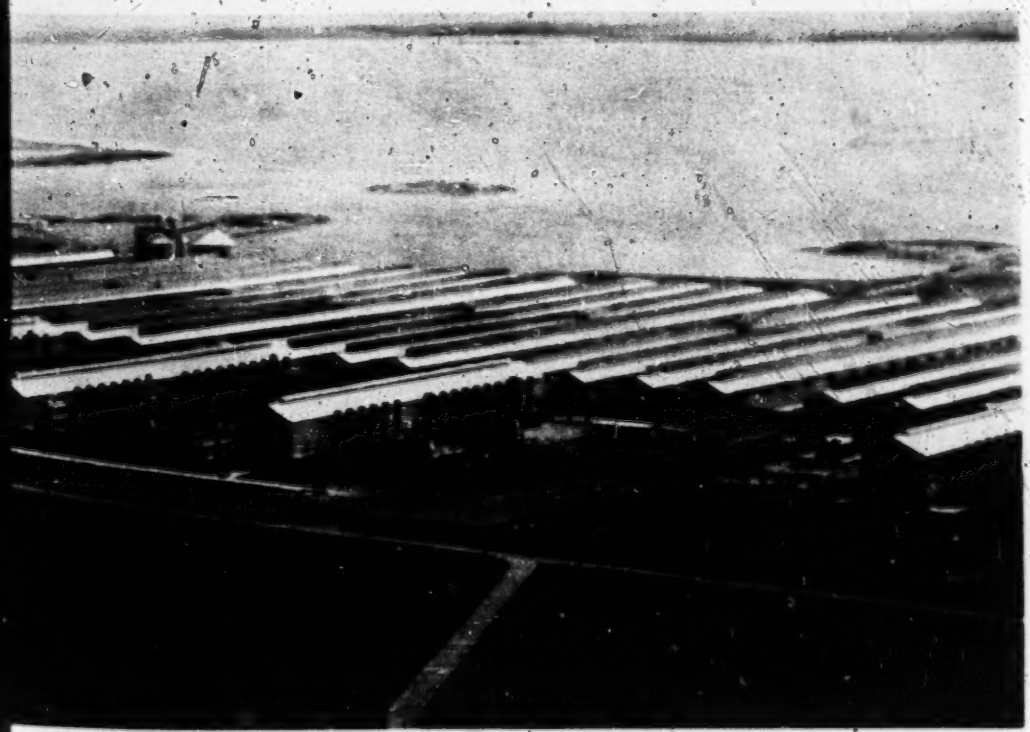
[fol. 4750]

on May 30 when the company exercised an option covering mining rights on more than 30,000 acres of bauxite-bearing lands in Jamaica. These deposits will be developed during the next three years by Alcoa Minerals of Jamaica, Inc. Alcoa's other major sources of bauxite are at Bauxite, Ark., and in Suriname, where operations are conducted by Suriname Aluminum Company.

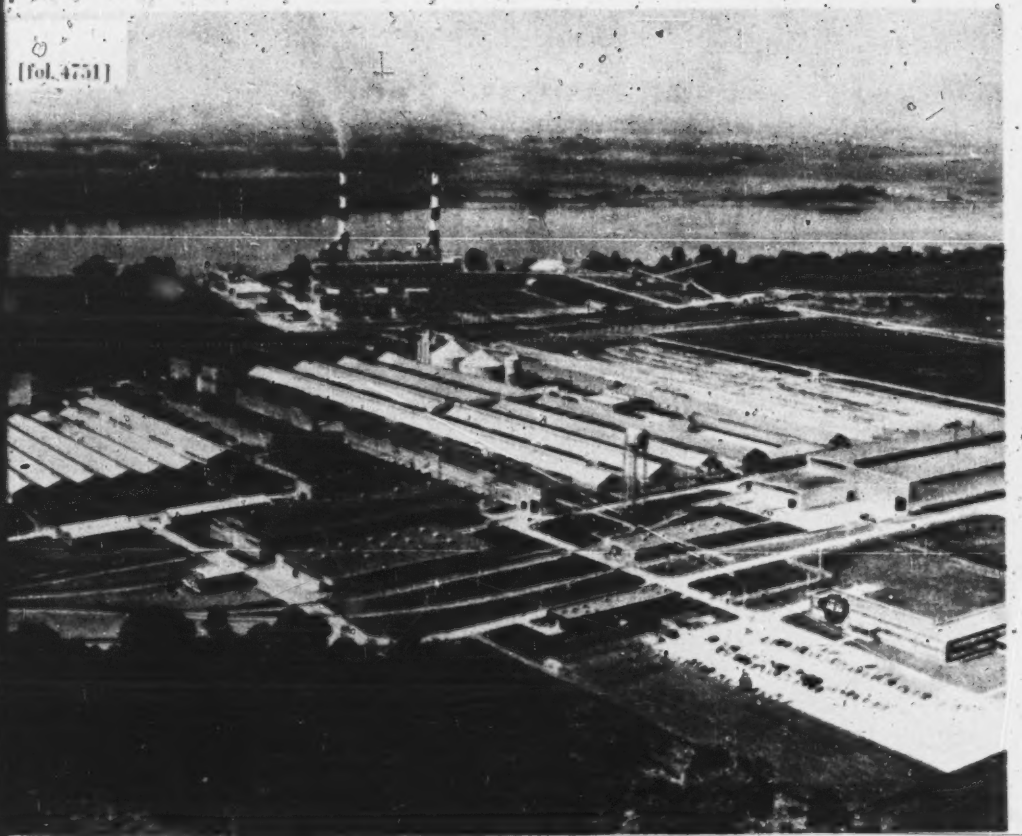
Remaining chemical operations at the East St. Louis, Ill., works have been scheduled to close early in 1962. New and more modern facilities at Bauxite, Ark., and Point Comfort, Tex., will replace the obsolete East St. Louis works for the production of aluminum fluoride, cryolite and alumina chemicals.



Alcoa's foil mills are now equipped to splice the ends of foil rolls by ultrasonic welding. The process permits converter customers to operate foil processing equipment at high speeds.



[fol. 4751]



Aerial view of Alcoa's newest smelter, Warrick works, which began operations in June, 1960, near Evansville, Ind., using electricity produced in a coal-fired, steam power plant.

Smelting

Production of primary aluminum by Alcoa totaled [illegible],000 tons in 1960 as compared with [illegible],000 tons in 1959. Although a number of idle potlines were restored to operation early in the year, one was closed in November and another was made inactive shortly after the end of the year.

The new Warrick, Ind., smelter began limited production in June. Completion of the plant will be de

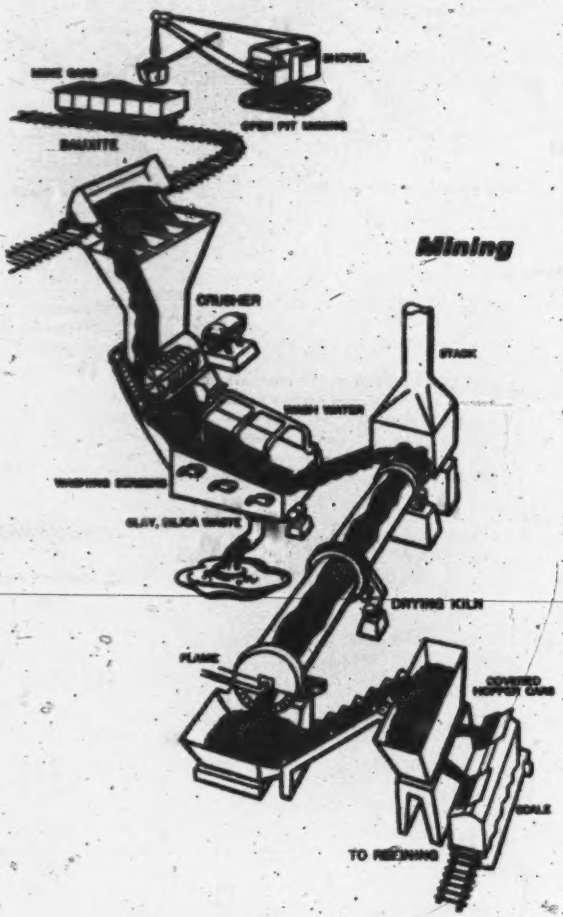
[fol. 4752]

ALCOA ▲ ALUMINUM

from mine to market

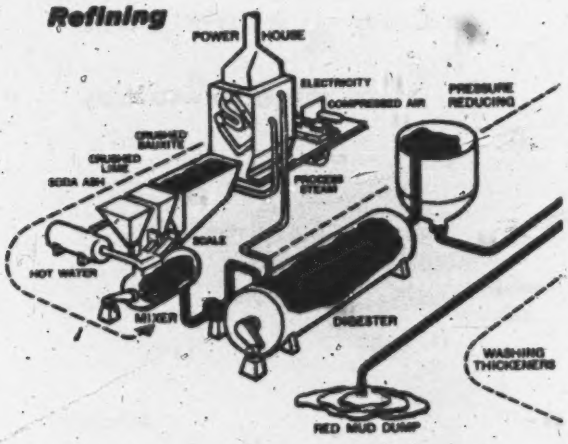


Bauxite, the ore most commonly used for the commercial production of aluminum, is found in large quantities in many parts of the world. Alcoa's major sources of bauxite are Suriname, the Dominican Republic, Jamaica (under development) and the State of Arkansas. Since bauxite usually occurs near the surface of the earth, it is mined with large power shovels. After being crushed and dried, it is shipped to refining plants for further processing.

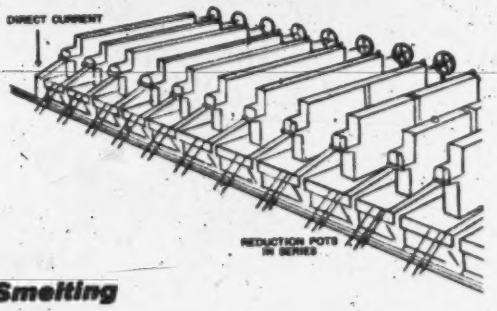
to Refining . . .

[fol. 4753]

Refining



In the refining process, bauxite is mixed with a solution of caustic soda. When the mixture is heated under pressure, only the hydrated alumina (aluminum hydroxide) contained in the bauxite dissolves, while the solids and other impurities which remain are filtered out. The filtered solution is then cooled to produce a precipitate of hydrated alumina. This alumina, after being filtered from the solution and washed, is heated in revolving kilns to 1800°F. The resulting white powder—pure alumina—is then shipped to smelting plants, usually in railroad hopper cars.



Smelting

Metallic aluminum is produced by an electrolytic process that separates alumina into its component parts—oxygen and aluminum. In this process, pure alumina is dissolved in a bath of molten cryolite (sodium aluminum fluoride) in large electrolytic furnaces called reduction pots. By means of a carbon anode suspended in the bath, electric current is passed through the mixture, causing metallic aluminum to be deposited on the cathode, the carbon lining of the pot, where it settles to the bottom of the cell. The heat generated by the passage of electric current keeps the bath molten so that alumina can be added as necessary to make the process continuous. At intervals, aluminum is siphoned from the pots and the molten metal is transferred to holding furnaces for removal of impurities or alloying with other ingredients. It is then cast into ingots of various sizes for further fabrication.

[fol. 4757]

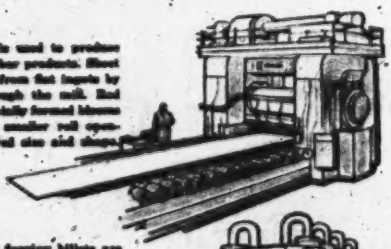
Fabricating

Aluminum has been called the world's most obliging metal, for it can be formed by every known metal-working process. The seven basic processes described here are simply the principal methods by which the majority of Alcoa's products are made. Alcoa uses many other fabricating processes.

Aluminum is readily joined by welding, brazing, riveting or soldering and is available in many different alloys suitable for a wide range of end uses. In addition, aluminum can be given an unusually wide variety of finishes. It can be painted, lacquered or colored permanently by an electrochemical process called anodizing. Because of its unique and valuable combination of advantages, aluminum has contributed greatly to man's progress and has become one of the most important metals of the 20th century.

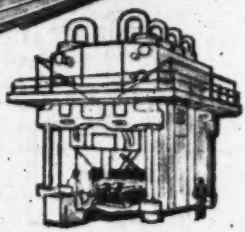
rolling

The rolling process is used to produce sheet, plate, rod and bar products. Sheet and plate are rolled from flat ingots by repeated passes through the mill. Rod and bar mills roll specially formed blooms through successively smaller roll openings to achieve desired size and shape.



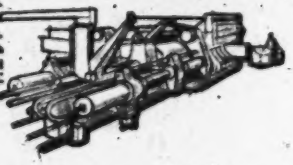
forging

Preheated aluminum forging billets are shaped either by forging hammers which pound the metal into prescribed shapes, or by forging presses which use pressures up to 50,000 tons.



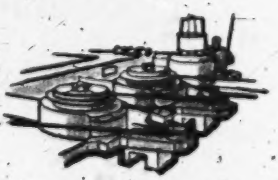
extruding

Because of its workability, aluminum is easily adapted to the extrusion process. Under pressure from a mechanical or hydraulic ram, ingot is forced through a die opening, taking the shape of the die. In impact extrusion, a cake-like slug of aluminum in a die is struck by a ram, causing the metal to flow back through the opening left between the die wall and the ram. The resulting hollow product assumes the shape of the opening.



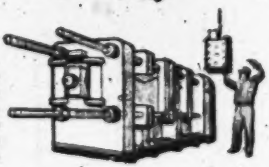
wire drawing

Because of its ductility, aluminum can readily be drawn into products ranging from bar to extremely fine wire. In this operation, aluminum stock is drawn through a series of metal dies which reduce the diameter and produce the desired shape.



casting

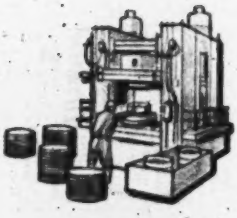
The casting process involves the solidification of molten metal in a mold having the shape of the finished product. In the sand, plaster and permanent-mold processes, aluminum is fed by gravity into the mold cavity. Aluminum die castings are made by forcing molten aluminum into a mold under pressure.



[fol. 4758]

deep drawing

Aluminum cooking utensils and many other types of containers are made by forcing a circular sheet of aluminum into a die under pressure from a hydraulic ram. Several preliminary draws may be made before the final shape and dimensions are achieved.



machining

One of the chief characteristics of aluminum and its alloys is the ease with which it can be machined. Castings, forgings, and many other products are regularly machined to their final shape and dimensions. This ease of workability makes possible high-speed production of screw machine products.

Basic Characteristics of Aluminum

Aluminum weighs only about one-third as much as copper or steel.

Aluminum is strong in alloy form.

Aluminum is highly resistant to corrosion.

Aluminum is an excellent conductor of electricity.

Aluminum transmits heat rapidly.

Aluminum reflects both light and radiant heat.

Aluminum can be safely used with foods and medicine.

Aluminum is nonmagnetic.

Aluminum can be given a wider variety of finishes than any other metal.

Aluminum does not readily absorb neutrons.

Aluminum can be formed by all known metal-working processes.

[fol. 4759]

ALCOA ALUMINUM

ALUMINUM COMPANY OF AMERICA
GENERAL OFFICES, 1501 ALCOA BUILDING
PITTSBURGH 19, PENNSYLVANIA

[fol. 4760]

ferred until market demand warrants the additional production.

Work progressed as scheduled on the Tuckertown Dam near Alcoa's Badin, N. C., smelter. The new dam, which will provide the fourth Alcoa hydroelectric installation on the Yadkin River, is expected to be completed by May, 1962. The Tuckertown Development is part of a general program to modernize and expand the smelting facility.

A program involving the addition of furnaces and casting facilities for production of various types of commercial ingot at smelting locations was carried out during the year, and the term "pig" was abandoned as a designation for primary aluminum products.

A new interlocking design was developed for the popular 50-pound ingot. This new design has a superior surface appearance and offers increased shipping stability and ease of handling for bundled ingot.

Brokopondo Project

The Brokopondo hydroelectric and smelting plant development of Suriname Aluminum Company in Suriname progressed on schedule during 1960. The new 45-mile road from the head of navigation of the Suriname River at Paranam to the dam site at Afobakka is open to traffic. The first bridge across the Suriname River, located just below the future dam, was also completed.

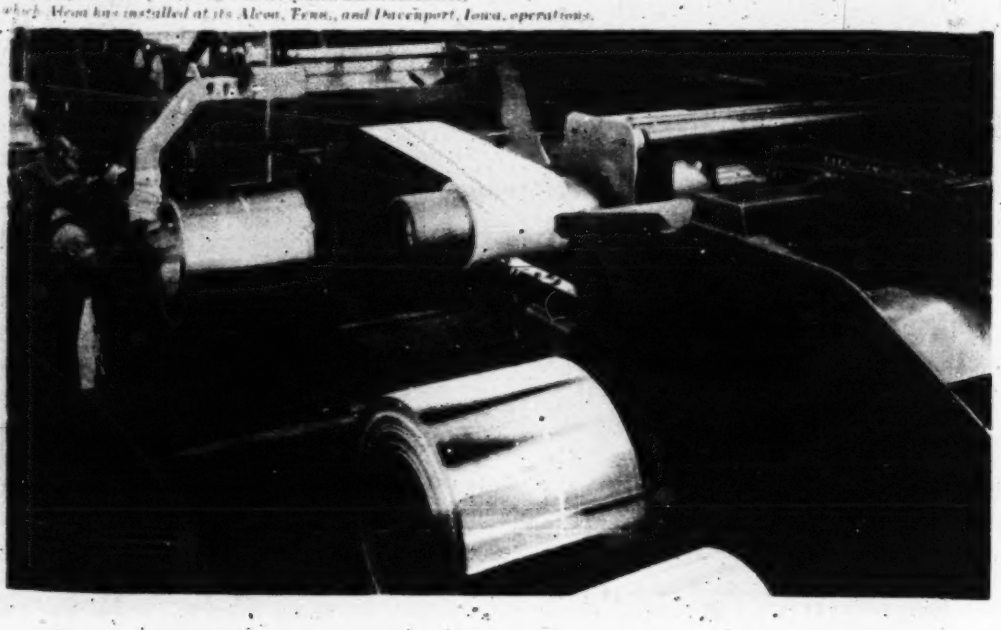
Construction of the dam itself started in August. The construction camp was enlarged to house 1,200 personnel, and permanent staff housing was built at Paranam, Jo and the dam site. A testing laboratory, office, shops and other essential service facilities near the dam were also completed during the year. Base warehouses and storage tanks were erected at the smelter site but construction of the smelter itself will be timed to match the completion of the hydroelectric development.

Fabricating

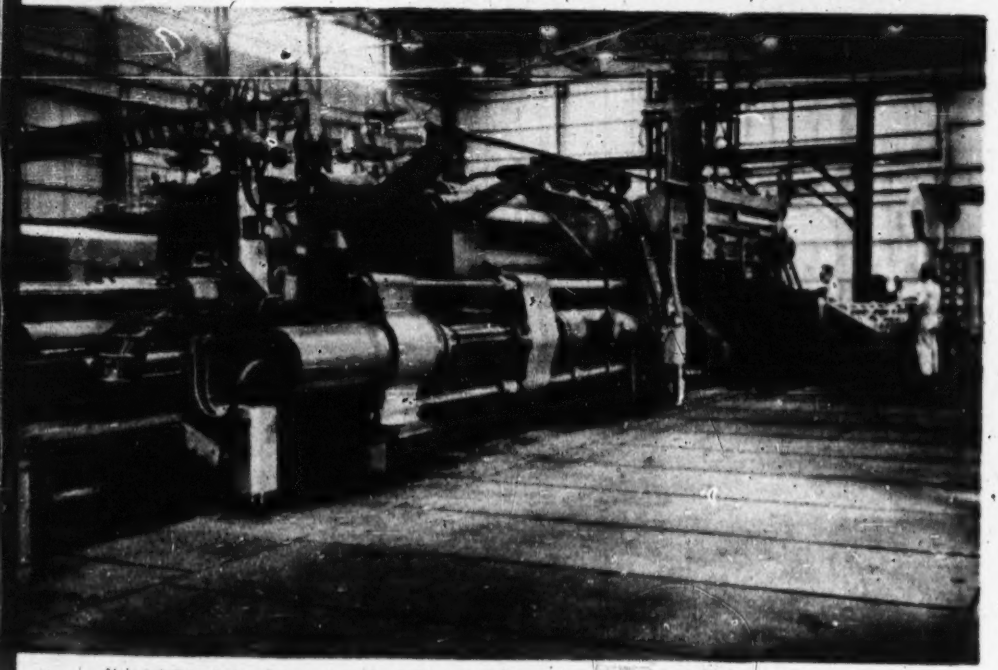
A continuing program of improvement and modernization in the fabricating plants resulted in several major changes in equipment, the decision to close two operating facilities and the start-up of one new facility.

The Bridgeport, Conn., foundry, primarily designed during World War II to produce a line of castings for the aircraft industry which are no longer needed in large quantities, will close by mid-1961. The balance of Bridgeport's casting business will be transferred to Alcoa's other foundries at Cleveland, Detroit and Los Angeles, and to the new Edison works near Metuchen.

New equipment for producing enamel-coated aluminum sheet, which Alcoa has installed at its Alcoa, Texas, and Davenport, Iowa, operations.



[ol. 4761].



New 5,000-ton extrusion press at Alcoa's Vernon, Calif., works. This press will fabricate large shapes for the architectural, aircraft and missile industries.

N. J., which began operations in the fourth quarter.

The Edison works replaces the Garwood, N. J., works, a smaller die casting plant that has been operated by Alcoa since 1928. Edison works, now equipped with die casting equipment of the latest design, offers greatly improved working conditions and provides space for expansion that was not available at Garwood. The new facility is located within commuting distance of the Garwood works and has allowed the company to retain the highly skilled personnel employed at the old location. Edison works will also be producing permanent-mold castings by mid 1961.

To meet the rising demand for enamel coated aluminum sheet, Alcoa began early in the year to increase its capacity to produce the new product. Construction was begun on two coating lines at the Davenport, Iowa, sheet and plate mill during the first quarter and both lines were placed in operation by the end of the year. The lines are equipped to coat sheet continuously in widths up to 48 inches.

In mid year, the company began a two year expansion and modernization of its two sheet mills at Davenport, Iowa, and Alcoa, Tenn., at a cost in excess of $18 million. Both mills have been expanded and updated regularly, but the new 1960-62 program is designed to make them even more efficient producers. Many of the additions and improvements will be aimed at improving the company's ability to roll light gages of sheet in large volume at high speeds. Demand for this product line has remained at record levels and an increasing potential is seen for it in building products, appliances, packaging and automotive applications.

[fol. 4762]

At the Richmond, Ind., works, a third major expansion in less than three years will provide additional capacity for the production of closures. The popularity of screw-on caps for baby food jars has had a significant part in this growth. Existing facilities at Richmond will also be modernized as part of this expansion.

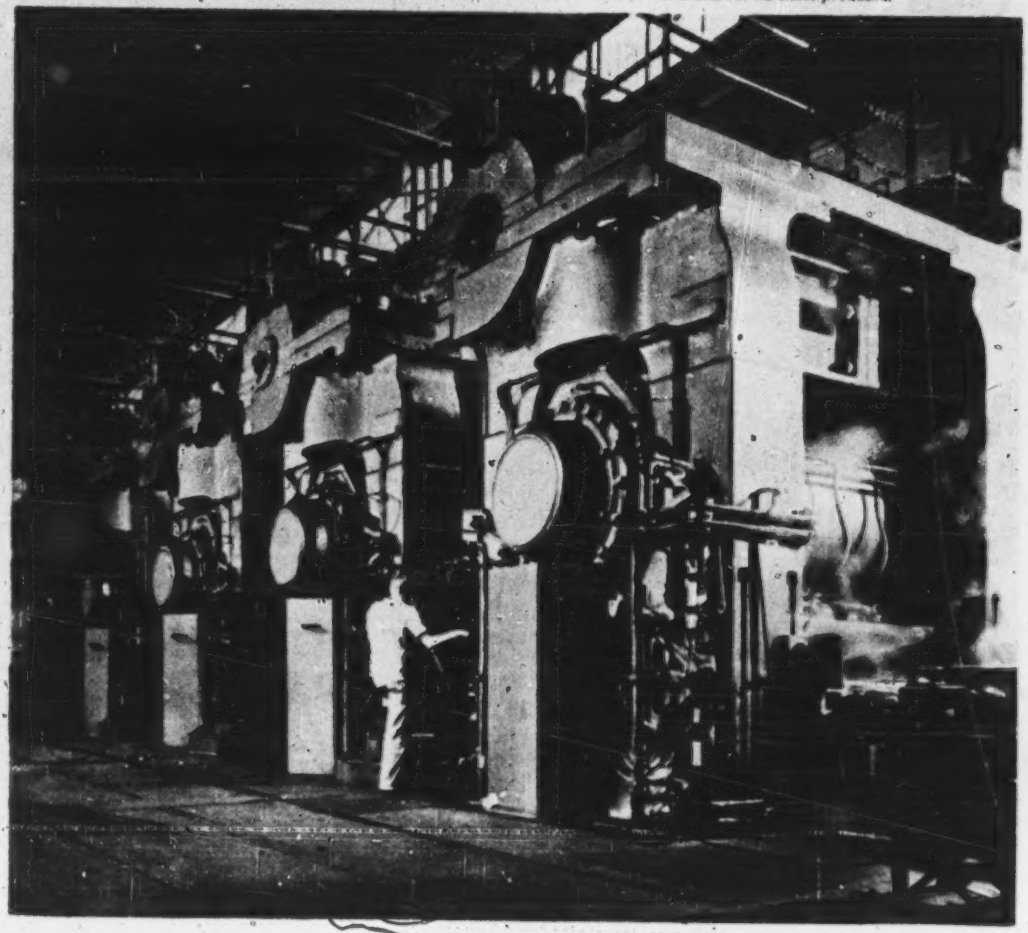
New equipment installations during the year included additional foil-paper and foil-wax laminators at Davenport, Iowa; a 44-inch, four stand tandem cold sheet mill at Alcoa, Tenn., and a 5,200-ton extrusion press at Vernon, Calif., works. Installation of a new 4,000-ton extrusion press is under way at Cressona, Pa.

Alcoa has equipped all foil mills with ultrasonic welding equipment. The ultrasonic weld fastens the ends of foil strips automatically, permitting a continuous coiling operation at considerable cost savings.

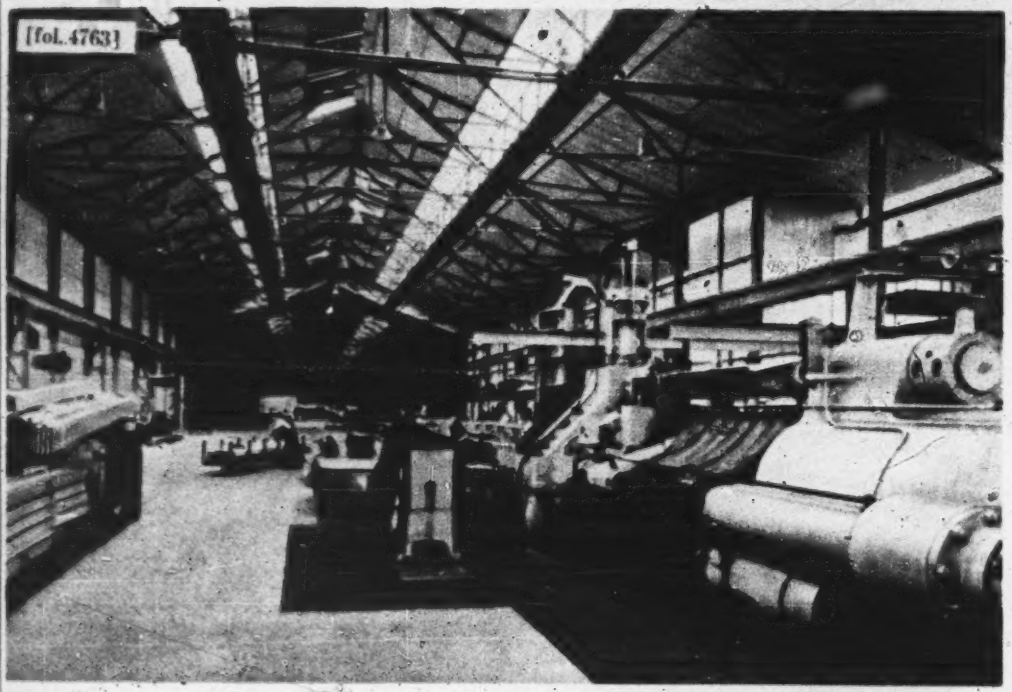
Alcoa Steamship Company, Inc.

In October, Alcoa Steamship Company, Inc., discontinued passenger service offered by the line's three passenger vessels because it was no longer economical. A limited passenger service will continue throughout the Caribbean area in freight ships and ore carriers.

Huge rolling mills, such as this one at Alcoa, Tenn., are undergoing improvement and modernization as demand increases for new and varied sheet products.



[fol. 4763]



Interior view of extrusion mill at Southern Forge Limited, one of the companies in England jointly acquired by Alcoa and Imperial Chemical Industries Limited during 1960.

FOREIGN ACTIVITIES

The company's foreign interests continued to grow during the year. Two acquisitions were made by Imperial Aluminium Company Limited, a British affiliate in which Alcoa owns a 49 per cent interest. Impalco, as that company is called, in February acquired Invicta Foil and Chewright & Nicholls Foil Limited, a small foil manufacturing and converting company which has been renamed Impalco Foils Limited. On April 1, Impalco also purchased the aluminum rigid foil container facilities of The Prestige Group, a British affiliate of Ekco Products Company.

On May 4, Alcoa and Imperial Chemical Industries Limited, known as ICI, each acquired a 50 per cent share of a group of United Kingdom companies known as the Associated Light Metal Industries, or Almin Limited. The key company in the group is International Alloys Limited, the largest secondary smelter in the United Kingdom. The group also includes several aluminum fabricating concerns.

The company's Japanese affiliate, Furukawa Aluminum Co., Ltd., is continuing expansion of its operations with the technical assistance of Alcoa, and is increasing its investment in other fabricating operations in Japan.

Sales of the company's products in overseas markets doubled during 1960 as compared to 1950. Vigorous programs are being formulated to define and achieve further penetration of these markets.

ORGANIZATION CHANGES

Robert B. McKee, formerly vice president in charge of direct selling and distribution, was elected vice president in charge of sales on February 1, 1960. On this same date, Frederick J. Close, formerly vice president in charge of sales development and industry sales, was elected to the newly established post of vice president and general sales manager.

On April 21, John S. Harrison, formerly general manager, personnel, was elected vice president in charge of personnel and industrial relations.

On September 15, 1960, three major changes were made in Alcoa's executive management. Frank L. Magee, Alcoa president since 1957, was elected chairman of the board and will continue as the company's

[fol. 4764]

chief executive officer. Lawrence Litchfield, Jr., executive vice president and member of the board of directors, was named president. I. W. Wilson, chairman of the board since 1957, was named chairman of the company's finance committee.

At a meeting of the board of directors held on December 15, the following management changes were made:

H. C. Erskine, formerly vice president in charge of production, was elected executive vice president.

John D. Harper, formerly assistant general production manager, was elected vice president in charge of smelting and fabricating.

George W. Streepey, formerly assistant general production manager, was elected vice president in charge of raw materials and refining.

Edward B. Wilber, formerly vice president and treasurer, resigned as treasurer and continues as vice president in charge of finance.

Matt. W. Stanley, formerly assistant treasurer, was elected treasurer.

Deceased

The directors and officers of Aluminum Company of America report with deep regret the deaths of two former directors.

Mr. George J. Stanley died on September 7, 1960. He had been a member of the board of directors since 1939. Mr. Stanley served as vice president of Alcoa from 1931 until his retirement from this post in 1947.

Mr. George C. Allen died on October 10, 1960. Mr. Allen was a member of the board of directors from 1926 to 1936.

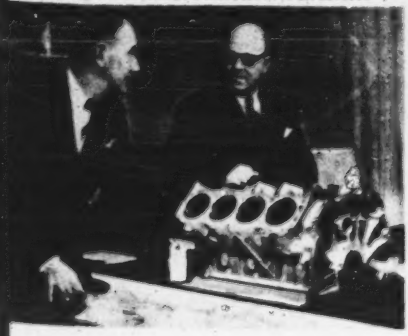
HONORS

Roy A. Hunt, chairman of the executive committee of Alcoa, received an honorary Doctor of Humane Letters degree from Grove City College on June 6, 1959. On April 5, 1960, Mr. Hunt received the Distinguished Alumni Award from Shadyside Academy in Pittsburgh, Pa. The Pennsylvania Society presented

(left to right) William K. Davenport, I. W. Wilson, Edward B. Wilber, Matt. W. Stanley

(left to right) H. C. Erskine, George W. Streepey, John D. Harper, John S. Harrison

(left to right) Frederick J. Close, Robert B. McKee



[fol. 4765]

Mr. Hunt its annual Gold Medal Award for Distinguished Achievement on December 10, 1960.

John D. Harper, vice president in charge of smelting and fabricating, was cited with an award by the Austin, Tex., Headliners Club on January 30, 1960 for helping to bring industry to Central Texas.

The Alcoa News, Alcoa's employee magazine, received a Freedoms Foundation Award in February, 1960, for articles furthering "a better understanding of the American Way of Life" during 1959.

O. C. McCreery, assistant to the president, was given the Annual Alumni Award for Outstanding Achievements by the University of Minnesota on May 7, 1960.

Leon E. Hickman, executive vice president of Alcoa, received a Doctor of Laws Degree from West Virginia Wesleyan College on May 24, 1960.

Jay M. Sharp, manager of general advertising, was elected chairman of the board of directors of the Association of Industrial Advertisers in June, 1960.

In September, Alcoa was named among the 20 companies rated "Best Managed" by 171 corporation presidents in a panel sponsored by *Dun's Review and Modern Industry* magazine.

M. M. Anderson, executive vice president of Alcoa, was re-elected president of The Aluminum Association, principal trade organization of the industry.

PERSONNEL AND INDUSTRIAL RELATIONS

Throughout 1960, the company continued its efforts to help its people make their fullest contribution to the enterprise and derive the maximum satisfaction from their positions.

Management Development and Employee Education

Pittsburgh conferences of the Management Development Program were continued during 1960, bringing small groups of key management personnel together to review the company's problems and progress and to improve their individual effectiveness as managers for present and future responsibilities. Two hundred seventy management people have participated in this program in the past several years.

All levels of supervision have cooperated to improve employee understanding of the company's competitive problems and of the need to do the best possible job. Supervisory training programs for these objectives were conducted at plant locations. Courses in creative thinking were given at works locations and in the headquarters offices.

Approximately 300 trade apprentices were in training at 18 works locations during 1960. Graduated apprentices during the year numbered 75 and 12 previous graduates advanced to supervisory positions. An additional 700 men received technical training.

In order to seek out the best of 1960's college graduates, Alcoa's college recruiting staff with assistance from other company representatives visited 144 college campuses. From approximately 5,000 applicants who were interviewed and screened on campus and at company locations, 350 outstanding young men were selected for presently needed sales, technical and operating requirements and to provide a continuing source of future managers.

Employee Benefits

The Employees' Group Insurance Plan provides sickness and accident benefits and hospital and surgical insurance for active employees of Alcoa and their dependents as well as life insurance for active and retired employees. Effective August 1, 1960, the plan was revised to provide hospital expense and surgical operation insurance to employees retired on pension under the Employees' Retirement Plan, and their wives.

The Voluntary Life Insurance Plan, for which the employees pay, and which became effective in 1949, provides additional amounts of life insurance and non-occupational accidental death and dismemberment insurance at favorable rates. The plan provides that life insurance in reduced amounts may be continued following retirement. As of December 31, 1960, approximately 35,000 employees were insured for nearly $400,000,000 of life insurance.

Industrial Relations

During 1960, additional wage and fringe benefit adjustments were made effective under the terms of the labor agreements negotiated in late 1959 and early 1960. These labor agreements expire on July 31, 1962. During the year there were no major strikes or work stoppages. Encouraging progress was made in the area of constructive employee and union relations with particular emphasis on assuring better understanding of the company's competitive situation and productivity requirements.

FINANCIAL REVIEW OF 1960

Net Income and Gross Revenues

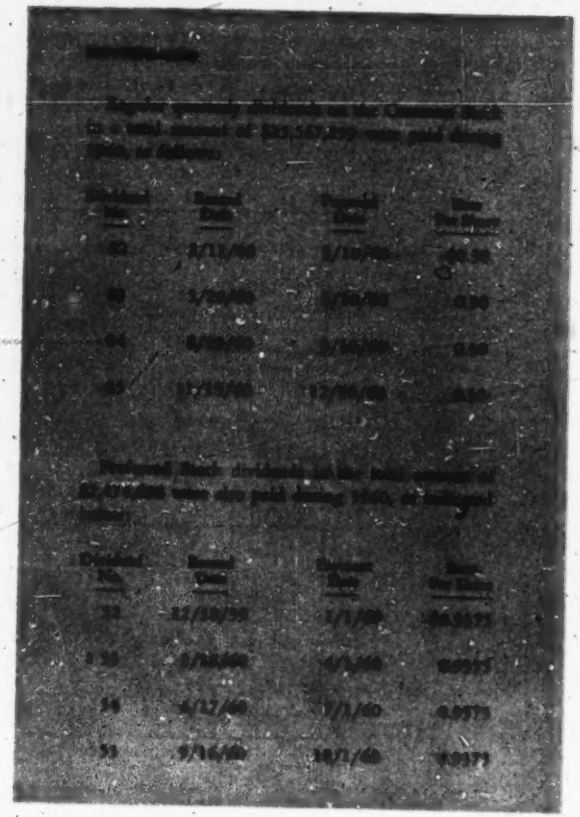
Although net sales, operating revenues and other income, aggregating $869,780,176 in 1960, exceeded the $864,967,722 of gross revenues in 1959, net income decreased from $55,570,854 to $40,044,103. The 1960 amounts include operations of Rea Magnet Wire Company, Inc. and Cupples Products Corporation, which were acquired in January 1960. Based on the number of shares of common stock outstanding at the end of each year, net income was $1.76 per share in 1960 as against $2.52 per share in 1959.

Income before taxes in 1960 was $47,144,105, or 5.4 per cent of gross revenues as compared with $90,570,854, which amounted to 10.5 per cent of gross revenues in 1959, indicating the effect of a continuing erosion of prices on fabricated and mill products that prevailed throughout the industry during 1960. Although Alcoa announced price increases effective August 1, 1960 on certain fabricated and mill products, the general price trend prevented the full realization of such increases, which, if obtainable, would have substantially mitigated the effect of contractual increases in labor costs that became effective on that date. An additional factor that adversely affected the amount of income before taxes was the payment of $9,477,520 to a selling subsidiary of a Canadian corporation in return for the cancellation of a substantial portion of Alcoa's obligation to purchase primary aluminum under a purchase contract consummated in 1953. This contract is more fully described in Note D to the Consolidated Financial Statement appearing in the company's 1959 Annual Report. The company's remaining maximum obligation to acquire metal under such purchase contract amounted to approximately $8,300,000 as of December 31, 1960.

Selling, general administrative and other expenses increased in 1960, partly as a result of the inclusion of the acquired subsidiaries, increased research and development and expanded sales activities.

The effective income tax rate in 1960 was substantially lower than the comparable rate in 1959, principally because of a substantial decline in the profits on domestic manufacturing operations, without a corresponding decline in profits on foreign mining and other operations that incur lower income tax rates. Other matters which affected the income tax rate were allowable percentage depletion; restoration to income of a reserve for molds and dies no longer required and income which was subject only to a capital gains tax. Also, Alcoa elected to file a consolidated Federal Income Tax return for 1960 whereas separate tax returns were filed by the company and each of its consolidated subsidiaries for a number of previous years.

The amount of the reserve for future taxes on income applicable to 1960 has been restored to income. This reserve, which had been provided in prior years, applied to taxes that were deferred principally because the company elected to amortize the cost of assets covered by certificates of necessity for tax purposes at accelerated rates while depreciating the same cost for book purposes at normal rates.



[fol. 4767]

Capital Expenditures

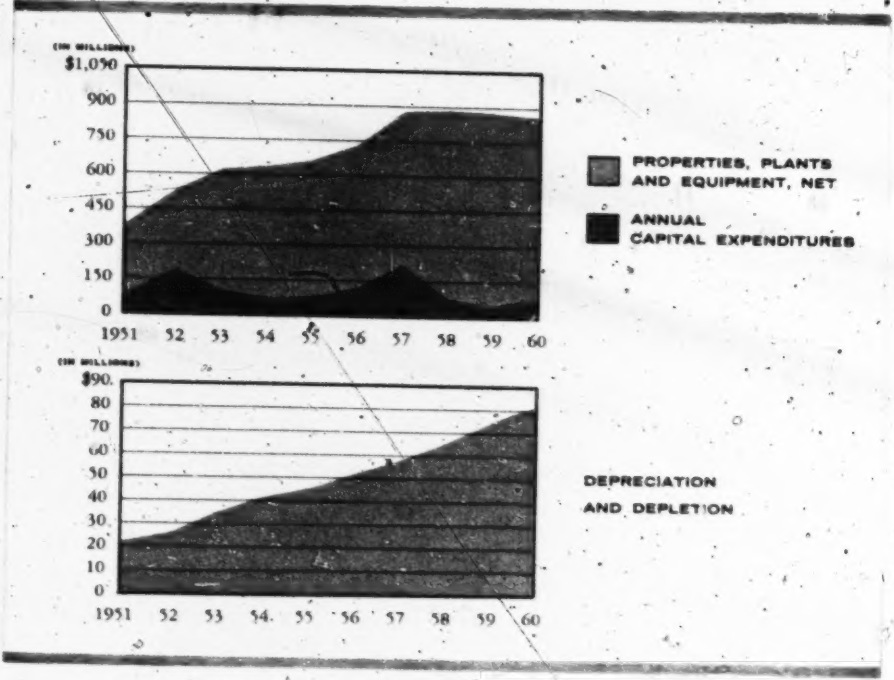
A total of $80,341,301 was invested in properties, plants and equipment during 1960. Major emphasis was placed on capital improvements directed toward reducing costs, improving quality, and acquiring facilities for the production of new products. Substantial sums were expended to continue the Brokopondo Project; complete the new die-casting plant at Edison, N. J.; finish the first potline at the Warrick, Ind., smelter; continue the hydroelectric project and smelter modernization at Tuckertown, N. C., and Badin, N. C., respectively; construct a new chemical plant at Bauxite, Ark.; and initiate the expansion of sheet-rolling facilities at Alcoa, Tenn., and Davenport, Iowa.

At December 31, 1960, unexpended balances of authorized projects amounted to $171,491,000. It is estimated that approximately $73,000,000 will be expended during 1961. Major items in the proposed program include development of the Jamaican bauxite ore deposits; construction of a fluoride plant at Point Comfort, Tex.; continuation of the expansion of sheet-rolling facilities, and continuation of the Tuckertown and Brokopondo projects.

Debt

During 1960, total debt of the company increased from $437,726,095 to $447,885,439, the latter amount equivalent to 59 per cent of the shareholders' equity in the company at the end of the year, a slight reduction from the previous year-end amount. Long-term debt decreased $24,715,656, but this decrease was offset by short-term borrowings. Short-term debt increased during 1960 in an amount of $34,875,000 for the purpose of continuing the capital expenditure program initiated in 1960 and continuing in 1961. It is expected that short-term debt will be increased moderately during 1961.

As a result of open market transactions, the company acquired, and submitted to the trustee for cancellation, sufficient securities of its four outstanding debenture issues to satisfy all the mandatory sinking fund requirements for 1961 and $1,231,000 applicable to sinking fund requirements for 1962. In addi-



[fol. 4768]

tion, the annual installment of $2,500,000 due January 1, 1961 on the 2.55 per cent note was paid December 31, 1960.

The following table details the mandatory debt retirement schedule of outstanding long-term debt at December 31, 1960:

(In Thousands of Dollars Per Year)

Due:	Debentures 3⅛% 1964	3% 1979	4¼% 1982	3¼% 1983	Notes 2.55% 1967	3% 1973	Annual Total

100% $869,780,176
Gross Revenues

**Although taxes are only 2.41% of money taken in, they represent 34.38% of earnings before taxes.*

Employees' Stock Option Plan

At the annual shareholders' meeting on April 17, 1952, the current equivalent of 1,956,292 shares of the common stock of the company were reserved for purposes of the Employees' Stock Option Plan by action of the shareholders. At December 31, 1960, 322,258 shares remained reserved for the granting of future options.

The following table details certain information with respect to shares covered by options during 1960:

Covered by unexercised options at beginning of year		515,874
Purchased during the year	30,875	
Covered by options cancelled during the year	925	
Covered by options expired during the year	1,450	33,250
Covered by unexercised options at end of year		482,624

All unexercised options are presently exercisable except the options covering 217,200 shares granted in 1959, which become exercisable two years from the date they were granted, or upon such earlier date when the optionee either attains age sixty-five or dies while in the employ of the company.

AUDITORS' REPORT

TO THE SHAREHOLDERS AND
BOARD OF DIRECTORS,
ALUMINUM COMPANY OF AMERICA:

We have examined the consolidated balance sheet of Aluminum Company of America and consolidated subsidiary companies as of December 31, 1960, and the related statements of consolidated income and retained earnings and additional capital for the year then ended. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the accompanying consolidated financial statements present fairly the financial position of Aluminum Company of America and consolidated subsidiary companies at December 31, 1960, and the results of their operations for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

Aluminum Company of America is incorporated in the Commonwealth of Pennsylvania.

COMMON STOCK of Aluminum Company of America is listed on the New York Stock Exchange.

PREFERRED STOCK of Aluminum Company of America is admitted to trading on the American Stock Exchange.

NOTES

to consolidated financial statements

NOTE A. On January 19, 1960, 180,480 shares of Alcoa common stock were issued to Res Magnet Wire Company, Inc. for the assets of that company and Alcoa assumed the obligations of Res. On January 23, 1960, 64,209 shares of Alcoa common stock were issued to the shareholders of Cupples Products Corporation in exchange for all of the outstanding shares of that company. These acquisitions were treated as poolings of interests for accounting purposes as was the acquisition of Rome Cable Corporation in 1959.

NOTE B. Inventories are carried at the lower of cost or market, with cost being determined for substantially all inventories under the last-in first-out method. The classification of the inventories follows:

	December 31	
	1960	1959
Finished goods	$ 71,232,430	$ 65,969,312
Work in process	138,260,447	108,541,898
Bauxite and alumina	23,342,917	22,485,614
Purchased raw materials	15,354,551	15,059,350
Operating supplies	11,786,737	11,969,337
	$259,997,082	$224,025,511

NOTE C. Long-term debt comprises:

	December 31	
	1960	1959
Sinking fund debentures:		
3½%, due February 1, 1964	$ 32,500,000	$ 40,223,000
5%, due June 1, 1979	75,898,000	78,722,000
4¼%, due January 1, 1982	109,371,000	115,142,000
3⅛%, due April 1, 1985	114,600,000	119,422,000
Notes payable:		
2.35%, due January 1, 1967	15,000,000	17,500,000
3%, due December 1, 1975	60,000,000	60,000,000
	405,369,000	431,009,000
Miscellaneous, principally debt of subsidiaries	7,641,439	6,717,095
Total long-term debt	413,010,439	437,726,095
Less, amount due within one year included in current liabilities	768,837	1,442,226
	$412,241,602	$436,283,869

NOTE D. Costs of retirement plans charged to income amounted to approximately $12.3 million for 1960 and $10.5 million for 1959. The actuarially estimated past service cost of the plans not funded at December 31, 1960, was $12.7 million.

NOTE E. During 1960, the United States Government brought suit against Alcoa claiming that the acquisition of Rome Cable Corporation in 1959 for a consideration of 355,226 shares of Alcoa common stock violated Section Seven of the Clayton Act. There is no monetary liability asserted in connection with this case, but if the Government is successful, the likely relief would be a requirement that Alcoa divest itself of Rome. Alcoa is vigorously defending against this action.

NOTE F. Reference is made to the section of this Annual Report titled "Financial Review of 1960" for information with respect to capital expenditures, commitments, long-term debt and employees' stock option plan.

Wholly Owned Subsidiaries

ALCOA BUILDING PRODUCTS, INC.
Sells aluminum residential building products.

ALCOA EXPLORATION COMPANY
Conducts bauxite mining operations in the Dominican Republic.

ALCOA GENERATING CORPORATION
Owns the power plant which furnishes power to the Warrick works near Evansville, Indiana.

ALCOA INTERNATIONAL, INC.
Sells aluminum products in foreign markets, holds stock of a partially owned company and wholly owned subsidiary company, and owns ships used for transporting bauxite from Suriname, Trinidad and the Dominican Republic to the United States.

ALCOA INTERNATIONAL (U.K.), LIMITED
Solicits orders in the United Kingdom and Europe for all those Alcoa products sold by Alcoa International, Inc.

ALCOA MINERALS INC.
Inactive.

ALCOA MINERALS OF JAMAICA, INC.
Holds and is developing bauxite reserves in Jamaica.

ALCOA OF COSTA RICA, INC.
Holds bauxite concessions in Costa Rica.

ALCOA PROPERTIES, INC.
Owns coal properties in Indiana and Kentucky, to supply fuel for power generation at the Warrick works, near Evansville, Indiana, and at a possible future smelter near Sturgis, Kentucky.

ALCOA SECURITIES CORPORATION
Holds stock of certain partially owned affiliated companies, and other securities.

ALCOA SERVICE CORPORATION
Renders building services, and owns certain sales office buildings and other real estate.

ALCOA STEAMSHIP COMPANY, INC.
Owns, charters and operates ships transporting bauxite from Suriname, Trinidad and the Dominican Republic to the United States, and offers commercial service between United States East Coast and Gulf Coast ports and the Caribbean.

ALTON AND SOUTHERN RAILROAD
Owns and operates a belt line and terminal railroad in the vicinity of the East St. Louis, Illinois, works.

ALUMINIO ALCOA (VENEZUELA) S.A.
Holds capital stock of partially owned affiliated companies in Venezuela.

BAUXITE & NORTHERN RAILWAY COMPANY
Owns and operates a railroad in the vicinity of the Bauxite, Arkansas, works.

CEDARS RAPIDS TRANSMISSION COMPANY, LIMITED
Owns and operates electric transmission lines in Canada, transmitting electric energy for use at the Massena, New York, works.

COLUMBIA RIVER ORCHARDS COMPANY
Operates fruit orchards owned by Alcoa in the vicinity of the Wenatchee, Washington, works.

COMPANIA MINERA NUEVO LEON, S.A.
Explores for fluorspar in Mexico.

CUPPLES PRODUCTS CORPORATION
Fabricates, sells, and installs aluminum architectural products.

LAVACA PIPE LINE COMPANY
Owns and operates gas pipe lines to transport natural gas to the Point Comfort, Texas, works.

LID-ORE STEAMSHIP COMPANY, INC.
Owns and operates ships transporting bauxite from Suriname, Trinidad and the Dominican Republic to the United States.

LONG SAULT, INC.
Owns and operates electric transmission lines and a water distribution system at the Massena, New York, works.

MASSENA TERMINAL RAILROAD COMPANY, THE
Owns and operates a railroad in the vicinity of the Massena, New York, works.

MANTAHALA POWER AND LIGHT COMPANY
Owns and operates hydroelectric power plants and an electric utility system in western North Carolina.

PLEASANT HILLS WATER COMPANY
Sells water in the town of Riverdale, Iowa, near the Davenport, Iowa, works.

POINT COMFORT & NORTHERN RAILWAY COMPANY
Owns and operates a railroad in the vicinity of the Point Comfort, Texas, works.

POINT COMFORT WATER COMPANY
Furnishes water for the Point Comfort, Texas, works.

POST-MART, INC.
Sells a variety of household products.

REA MAGNET WIRE COMPANY, INC.
Manufactures and sells the smaller sizes of magnet wire, a product which is used in coil windings, transformers, motors and other electrical and electronic equipment.

ROCKDALE, SANDOW & SOUTHERN RAILROAD COMPANY
Owns and operates a railroad in the vicinity of the Rockdale, Texas, works.

ROME CABLE CORPORATION
Manufactures and sells various aluminum and copper products for the electrical industry.

SURINAME ALUMINUM COMPANY
Mines bauxite on lands held under concession from the Suriname government; and is constructing hydroelectric power and smelting facilities in Suriname.

SURINAME TRANSPORT COMPANY, N.V.
Owns floating equipment used for mine dredging and ship towing in Suriname.

TAPOCO, INC.
Owns and operates the Tallassee Project, a federally licensed hydroelectric development consisting of four power plants in North Carolina and Tennessee, to furnish power to the Alcoa, Tennessee, works.

WEAR-EVER ALUMINUM, INC.
Sells Wear-Ever aluminum cooking utensils, Kensington giftware, Cutco cutlery, Westmoreland sterling and Alcoa Wrap.

WEAR-EVER INTERNATIONAL, INC.
Sells Wear-Ever aluminum cooking utensils and Cutco cutlery in Latin America.

YADKIN, INC.
Owns and operates the Yadkin Project, a federally licensed hydroelectric development consisting of four power plants (three in operation and one under construction) in North Carolina, to furnish power to the Badin, North Carolina, works.

Re: Aluminum Report, Job No. 5-567
Aluminum Company of America,
New Kensington, Pennsylvania.

Attention: Messrs. Harry L. Smith, Jr., Vice President and Robert R. Cope, Head, Electrical Section, Development Division

Gentlemen:

In accordance with our letter of proposal of August 30, 1955, and your subsequent authority, dated October 17, 1955, we have prepared the accompanying report entitled "The Electrical Applications of Aluminum in the Building Industry."

The scope of the content of this Report is considerably broader and more general than originally anticipated. This development came about as a natural growth as we proceeded with our investigations.

Instead of being able to confine ourselves to a comparative study of several electrical aspects in a single office building, we found that a long chain of inter-related material had to be explored and hence it will be found the report covers the application of aluminum to virtually all areas of electrical use throughout the building industry as a whole.

Our electrical contractor survey on the use of aluminum (Section 12 of this report) was not originally anticipated, nevertheless we felt that such an addition to our survey and studies would endow the report with a valuable practicality and an important analyses of the extent of current interest in the application of aluminum. The exceptional response to this survey indicates and verifies a deep interest in aluminum electrical applications among contractors. Evidence of a more universal interest is the desire of a leading architectural magazine to publish an article based on this survey.

Although we have made no mention of it in this report,

we have developed preliminary proposals for an Aluminum [fol. 4780] Educational and Training program for Electrical Contractors and Electricians and have succeeded in interesting Local #3 of the International Brotherhood of Electrical Workers. If the Aluminum Company of America, either alone or with other aluminum producers, can decide on the extent to which they wish to back such a program, the Union has indicated that they will make their facilities available for such instruction. We feel that this is an opportunity that should be strongly exploited, since we have found that a good deal of the resistance to the electrical use of aluminum is due, in a large degree, to misinformation or lack of information among Contractors and Engineers and the inadequacy in skill among electricians and journeymen in the application of aluminum for electrical installations.

Very truly yours, The Firm of Edward E. Ashley, Consulting Engineers, Edward E. Ashley.

EEA:hk

[fol. 4781] Introduction

This report is a general review of the principal electrical uses of aluminum in the building industry. Each of the twelve sections composing this report is an integral article dealing with a particular area. It is believed that these articles can be read with interest and profit by electrical contractors and consulting engineers.

In general, an attempt has been made to indicate the present status of the use aluminum in each area, to review the best recommended techniques for its utilization, and to evaluate the relative economic factors. A small amount of historical material, descriptions of existing installations, and a few hazarded forecasts help round out and coalesce the various sections.

Section No. 1 is both a general introduction to the aluminum field and a summary of the information and conclusions developed in the report. Sections 2 through 11 deal with the use of aluminum in the various electrical areas. The largest sections have been devoted to wire and cable, busways, and conduit, since these are the principal electrical items in most commercial and industrial structures. Other sections deal with switchgear, armored cables, sheet metal enclosures,

lighting fixtures, cast fittings and enclosures, and reactors, transformers and machines. The material in these sections has been derived from an extensive perusal of the consider- [fol. 4782] able literature in this field, from the catalogs and publications of the aluminum and electrical equipment companies, from commercial and governmental statistical publications, and from interviews with engineers, contractors and manufacturers.

To round out the report with a determination of the actual practical status of aluminum in electrical building construction, questionnaires were submitted to 400 leading electrical contractors. The response to this survey was unusually good and indicates a tremendous interest in the electrical application of aluminum. The data obtained have been tabulated and analyzed in Section No. 12.

This report confirms that aluminum can successfully be used in most of the areas hitherto dominated by copper and in many of the applications previously reserved for ferrous and other metals. For some important products, such as large busways, aluminum is now the more economical material. In others, such as transformers, the use of aluminum is practical, but not yet economical.

For many years, the electrical industry has been largely dominated by a single metal—copper. Production of copper over the years has been uneven; and in times of crisis, the metal would be in short supply or even disappear completely from the commercial market. Price fluctuations, when not controlled by the government, are violent and have an unsettling influence on the planning of future costruction.

Now, the electrical industry appears to be rapidly settling [fol. 4783] itself on a bi-metallic standard. It seems logical to suppose that the emergence of aluminum in a powerful competitive position will have a stabilizing influence on the price and quantity of copper, now that this metal no longer enjoys a monopolistic advantage. In the rapidly and continuously expanding industrial and commercial areas, an assured supply of conductor metal is a most welcome situation. For the security of the nation, this development is no less valuable.

The electrical manufacturing companies have to a large degree met the challenge and responsibility thrust upon them by the rise of aluminum in the electrical field. Many prob-

lems have been successfully and brilliantly solved by far-seeing programs of research and development. Aluminum designs have been developed for many products, some of them as yet uneconomical, but ready for production when future price changes or copper shortages alter the relative price picture.

It appears doubtful whether the consulting engineers and the electrical contractors are as cognizant of the present and future possibilities of aluminum in the electrical field. Yet their adequate knowledge of the uses and relative merits of aluminum electrical application and products is essential, if aluminum is to attain the wide utilization for which it is presently suitable, both from a practical and an economical viewpoint. It is hoped that this report will enlarge the electrical horizons of these engineers and contractors by providing a convenient compilation of pertinent information and comparative data on the electrical applications of aluminum in the building industry.

[fol. 4785] Section No. 1

General

The course of human history has been marked by a number of distinctive epochs which are identified by the characteristic material of the time, which man utilized to enlarge his capacities and which raised him above the level of his previous existence. Thus, we have the stone age, the bronze age, the iron age and the steel age. Now, in the latter half of the twentieth century, it appears we may be on the verge of a new and final era—the aluminum age.

There is good reason for this thesis. First of all, aluminum is undoubtedly the most versatile of all metals, being capable of functioning, thanks to its myriad of allied forms, in an almost unlimited number of applications which require such varied properties as electrical conductivity, lightness, strength, corrosion resistance, non-toxicity, heat conductivity, reflectivity, low emissivity, machinability, workability, weldability, ductility and other properties, either alone or in combination. Secondly, and probably of major future importance, is the fact that aluminum is the most common metallic element[1] in the earth's crust, being present to an extent of almost 8 per cent, about twice that of iron.[2]

[fol. 4786] 1. *Refining and Reduction of Aluminum Ore*

In its natural ore, bauxite, aluminum occurs in extremely intimate union with oxygen in the form of a hydrated oxide. The raw ore is first refined, usually at or near its place of origin. Refining is largely a chemical solution and precipitation process whose end result is relatively pure aluminum oxide (alumina) powder.

Because of the powerful chemical bonds uniting the aluminum metal with oxygen, an electrolytic reduction process is required to reduce the alumina to the pure aluminum metal. The basic process, invented in 1886, utilizes a reduction cell consisting of a carbon lined pot, a molten cryolite solution within which the alumina is dissolved and a carbon anode.

Extremely heavy, low-voltage electrical currents passing through the solution precipitate the aluminum metal to the

bottom of the pot and liberate oxygen at the anode. The oxygen consumes the carbon anode by uniting with it and escaping in the form of carbon dioxide.

2. *Electrical Energy Requirements*

The quantities of electrical energy required for aluminum production in modern pot-lines are relatively enormous and often require the entire output of conventionally sized power plants. The cost of this electrical energy is a very substantial portion of the total mill price of the aluminum ingots.[4]

[fol. 4787] Consequently, availability and cost of electrical energy largely govern the location of aluminum reduction plants. Thus, the major plants are usually located where huge water-power resources can be harnessed to supply vast amounts of energy at virtually unity load factor, since the reduction process is a continuous operation.

So important is this factor that it is feasible to transport alumina thousands of miles to refining plants utilizing plentiful and cheap electrical energy. A prime example is the vast, new Kitimat Works of the Aluminum Company of Canada. To this great industrial complex located in the wild frozen reaches of Northwest Canada, refined bauxite ore from such far-distant mining regions as Jamaica in the West Indies is shipped in freighters thousands of miles to be reduced, and then, in metallic form, shipped back thousands of additional miles to the major markets of Eastern Canada and the United States.

3. *Growth of Aluminum Use*

The growth of aluminum use is largely determined by the extent to which it can replace copper and iron. These two metals and aluminum are the great triumvirate of strategic industrial metals. Two principal groups of factors are involved, technological and economic.

In a technological sense, great progress is evident. Suitable electrical alloys have been developed to crowd copper out of a large portion of the bus conductor field and press with increasing potential on the rich building wire and cable industry. High strength, corrosion-resistant alloys give [fol. 4788] great promise as structural members and find

increasing application as building materials. In addition a large number of new and expanded uses are continuously developing. These range from the relatively recent and spectacular transformation of aluminum foil into a household staple to the development of a new all-automatic and vastly cheaper repeating rifle to replace the relatively heavy and expensive weapon hitherto the armed forces standard.

4. *Relative Price Behavior*

Economically, aluminum has in the period between the end of World War II and today improved its relative position to a greater extent than any of the other common metals. Fig. #1 indicates that from the government-fixed prices of World War II to the end of 1956 aluminum rose about 75 per cent, pig iron 150 per cent, and copper 200 per cent. A perusal of charts and figures prepared by "American Metal Market" indicates that aluminum enjoys similar advantages with respect to tin, lead and zinc.

Going back even farther, it is interesting to note that today's basic aluminum ingot price of about 26¢ per pound is approximately the same as it was in 1926, when the dollar was worth about two or three times as much as today. Thus, during that period, it can be said that the basic cost of aluminum has decreased in the same ratio.

On the other hand, the prices of iron and the other nonferrous metals have risen to levels more than twice as high as they were at that time. Moreover, while the price of

USC

SEE 1

[fol. 4790] aluminum has maintained a rather steady rate of change, the price of other metals have been characterized by sudden changes of considerable magnitude, as can be noted on Fig. 1 and by studying the price history of the various metals in the statistics of the Bureau of Mines and "American Metal Market".

5. *Recent Increase in Aluminum Production*

These technological and economic factors have combined to generate a spectacular recent growth rate in aluminum production, a rate which promises to continue, if anything, at an even more accelerated pace.

A glance at Fig. 2 reveals the truly remarkable and continuing increase in production. Since the post-war dip of 1946, aluminum production has quadrupled, while copper, arch-rival of aluminum in the electrical field, has yet to re-attain its peak World War II production. Also notable is the fact that in 1954, aluminum production exceeded copper for the first time and appears likely to do so henceforth by ever greater margins.

6. *Comparison with Iron Production*

With respect to iron the story is, of course, different, since ferrous metals are still the basis of our economy, despite the promise and progress of aluminum. This is heavily underscored by the production figures tabulated below:

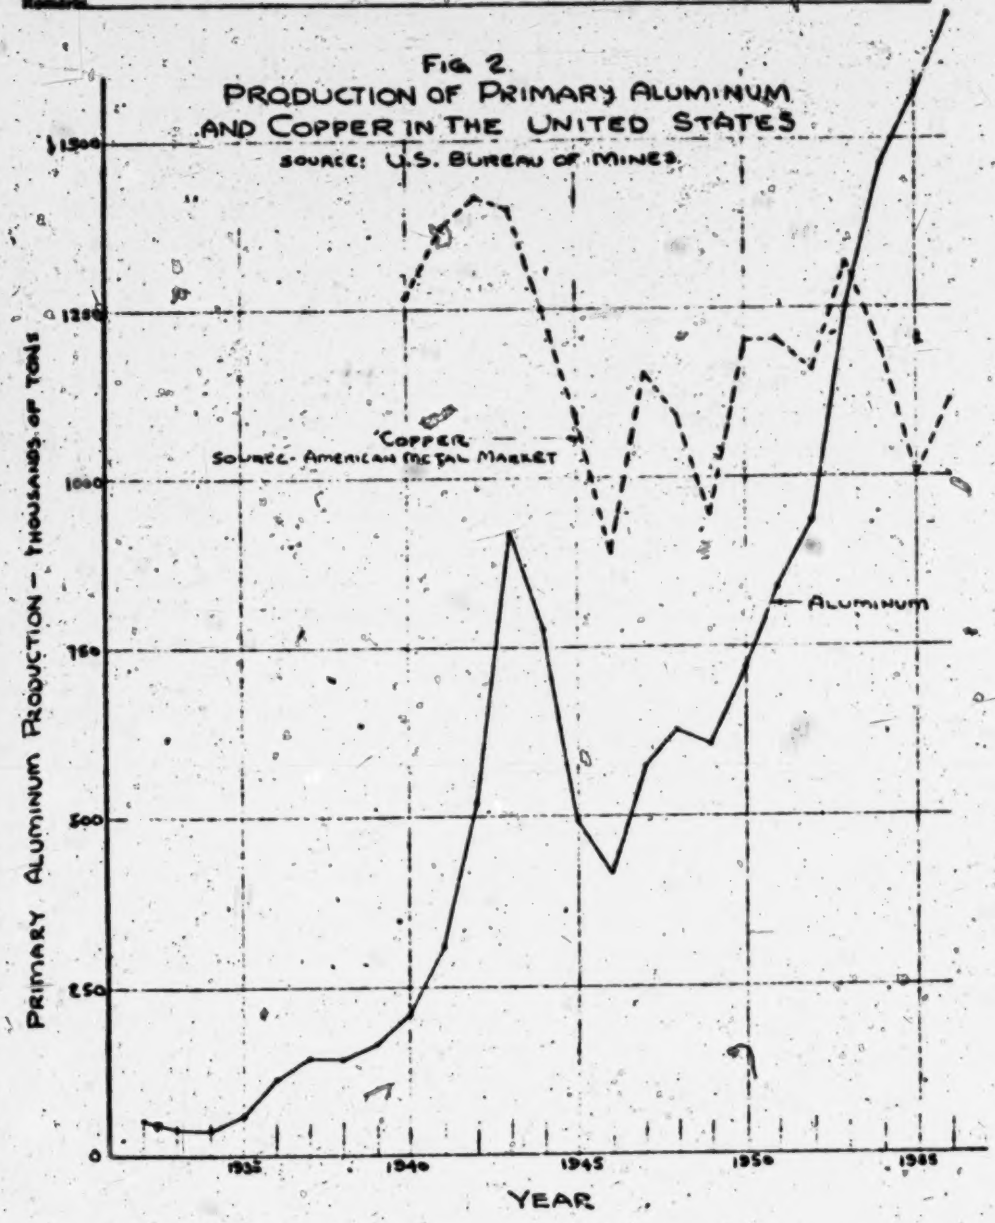
FIG 2

PRODUCTION OF PRIMARY ALUMINUM AND COPPER IN THE UNITED STATES

SOURCE: U.S. BUREAU OF MINES



[fol. 4792] Production—Millions of Tons of Primary Metal

	1946	1955
Aluminum	0.4 (100%)	1.6 (400%)
Pig Iron	45.6 (100%)	77.8 (170%)

Source: Annual Statistical Report, 1955. "American Metal Market."

Iron production has more or less kept pace with the general growth of the economy while aluminum has raced far ahead. There are indications that this pace may continue since progress is being made in the increased utilization of aluminum in automotive and railroad bodies, ship hulls and superstructures, containers and enclosures, household utensils and appliances and structural applications, all vast fields still dominated by the ferrous metals.

7. *Aluminum Production Capacity and Producers*

At any rate, the plans of the primary aluminum producers are definitely optimistic. Annual production capacity in the United States at the end of 1956 was somewhat more than 1¾ million tons. Installed capacity for the end of 1958 is expected to exceed 2½ million tons, an increase of about 40 per cent in two years.[5]

Moreover, while at one time, the Aluminum Company of America was the sole producer, there are now three more giants in the field—Kaiser Aluminum, Reynolds Aluminum and the Aluminum Company of Canada. In addition, several smaller companies in the United States and Canada are either producing or planning to produce primary aluminum.[6]

[fols. 4793-4794] 8. *Allocation of Aluminum Production*

Although aluminum production now considerably exceeds that of copper, a considerably smaller proportion of aluminum is devoted to electrical use. Over the past two years, semi-annual figures released by the Aluminum Association indicate that the major categories of wrought aluminum products have maintained relatively constant percentages, approximately as follows:

Building Materials	20%
Consumer Durable Goods	12%

Transportation	17%
Electrical	8%

The major portion of the 8 per cent devoted to electrical use undoubtedly is used in the manufacture of high voltage transmission cable, mostly for ACSR, which for many years has been the industry standard in this field. An increasing amount is lately finding its way into the fabrication of busbars for use in high amperage bus-ways and in switchboards and switchgear. The major manufacturers of busway recently have been quoting aluminum conductor busway at 20 per cent less than the equivalent copper conductor busway.

8. *Recent Price Behavior—Copper and Aluminum*

Since shortly after World War II, the relative cost of aluminum has been extremely favorable with respect to copper (see Fig. 1). At that time the price per pound of copper abruptly exceeded that of aluminum for the first time since the depression and has maintained the same rela- [fol. 4795] tive position ever since. Indeed, the price difference continued to increase rapidly until in 1956, copper reached an unheard of high of 46 cents per pound while aluminum was selling for 26 cents per pound.

However, since June, 1956, the price of copper was affected by an equally spectacular fall until today, March, 1957, it is selling at a base price of 32-34 cents per pound. Meanwhile, aluminum has continued at 26 cents per pound. This behavior is reflected by the curves in Fig. 3.

9. *Effect of Favorable Price Situation*

Needless to say, the suddenly magnified favorable price situation made aluminum immediately competitive with copper and extremely attractive to potential users, despite lack of experience in its use and certain technical difficulties, such as connections, which have since been largely solved. This favorable situation was and remains particularly true where relatively large amounts of conductors are required, as for example, bus bar and in the large circular mil cable sizes. It has also given added stimulus to

research and development efforts directed toward the replacement of copper in such products as motors, transformers, connectors, reactors, lamps, telephone frames, magnet wire and switchgear.

10. *Short Supply of Copper*

In addition to the impetus of existing price differentials, another

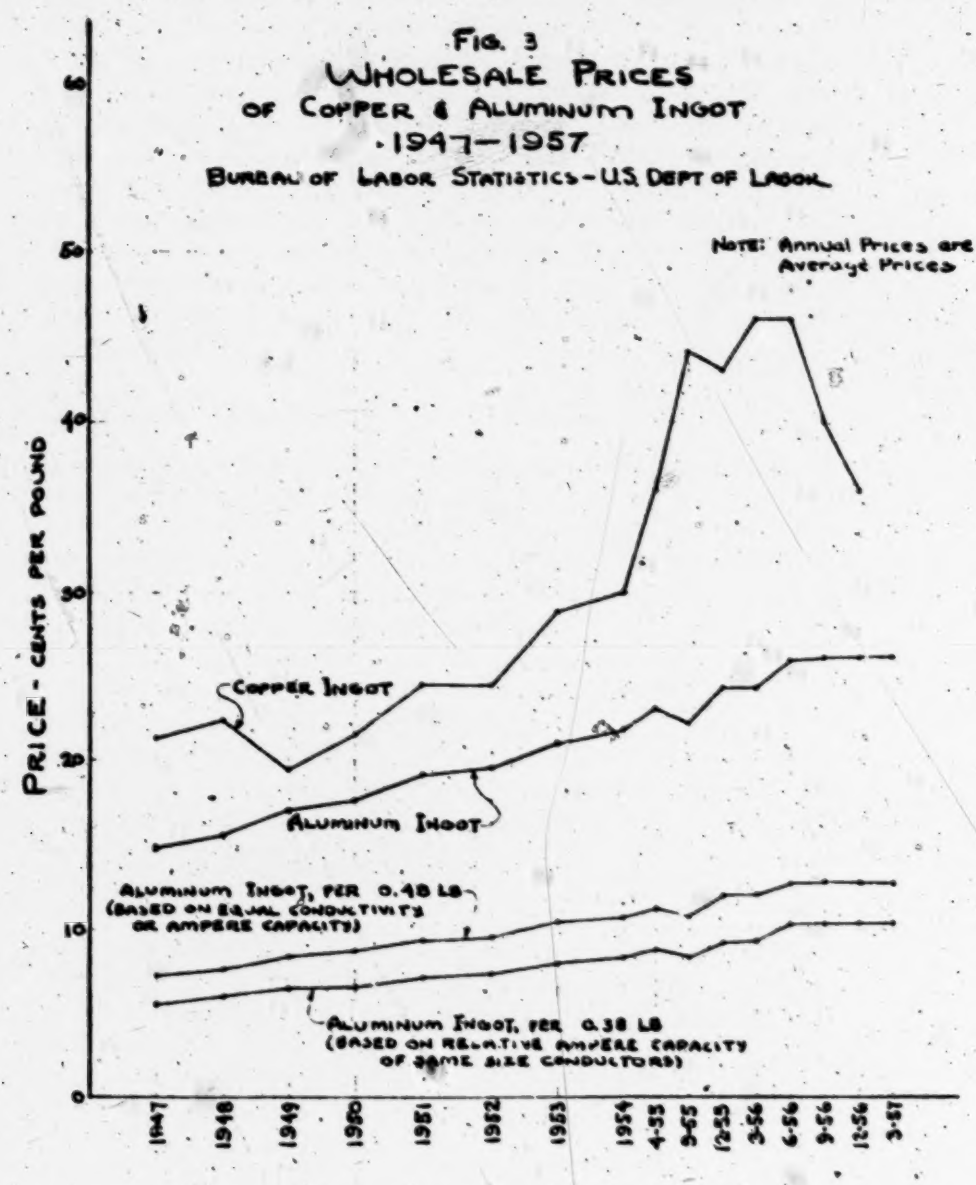
OF COPPER & ALUMINUM INGOT
1947–1957
BUREAU OF LABOR STATISTICS – U.S. DEPT OF LABOR

NOTE: Annual Prices are Averaged Prices



[fol. 4797] powerful factor in pushing aluminum into every phase of the electrical industry has been the potential shortage of copper. This potential has been realized all too completely in periods of emergency, when the government has found it necessary to seize and control all supplies of copper, making it largely or completely unavailable to many segments of the electrical industry.

As far back as the 1930's and before, forward-looking manufacturers were aware that copper was approaching a chronic condition of short supply, while aluminum, one of the most plentiful elements in the earth's crust was potentially capable of maintaining a practically unlimited rate of rising production. Consequently, considerable developmental work was done on a wide range of products, so that when the inevitable conditions of scarcity or competitive price arrived, these products were immediately or shortly available in the market.

11. *Present Aluminum Electrical Applications*

Thus, aluminum building cable is presently available in practically all sizes and insulations. Aluminum busway is outselling copper busway. Aluminum conductor reactors are available at lower prices than copper-reactors. Transformers, generators, and motors have been developed with aluminum windings. Incandescent lamp bases, after years of difficult development[6], are now standard in aluminum. Aluminum conduit is becoming increasingly competitive and finding increased use. A tremendous range of conduit fittings is available in aluminum at competitive prices. Switch-[fol. 4798] gears and switchboards employ aluminum bus bars and sometimes aluminum enclosures as well. Aluminum cable trays are replacing steel trays as standard equipment. Aluminum is being used in a host of additional applications and products such as appliances, connectors, armored cable, electronic tube chassis, induction motor rotors, high-voltage switches, high-voltage switchyard bus and structure, turbine-generator windings and cooling fans, and high-capacity bus enclosures.

12. *Aluminum Cost as Function of Current Capacity*

Aluminum is less expensive than copper on a weight or volume basis. It has a lower volume conductivity, 61 per cent as compared to 99 per cent for copper; but because of its low specific gravity (2.70 as compared to 8.89) for copper, it is more than twice as conductive as copper on a mass-conductivity basis. The lowest curve of Fig. 3 indicates the relative cost of aluminum as compared to copper on an equal-size basis. The curve is based on the fact that aluminum cables of medium range sizes (#4/0 to 500 MCM) have an ampere capacity about 80 per cent as great as a copper cable of the same size. On this basis, it can be seen that as of Dec. 1956 copper cost was 3½ times as much as aluminum.

The second curve from the bottom of Fig. 3 is a measure of relative metal cost for equal ampere capacities. As explained in Section 2 (Wire and Cable) of this report, cable [fol. 4799] capacity is more a function of diameter rather than area. Consequently, an increase of capacity from 80 per cent to 100 per cent requires a cable with an area not 125 per cent as great, but roughly 156 per cent (125 squared) as great. However, relative metal price of aluminum is still only about ⅓ to ⅔ that of copper.

Of course, this is far from the relative economics of purchased cable, since manufacturing costs will tend to equalize cable costs, the more so as insulations and coverings become thicker and more complex.

Other factors which tend to equalize aluminum and copper costs are connector costs, generally greater for aluminum, and increased feeder conduit sizes required for many aluminum cables of carrying capacities equal to those of copper cables.

13. *Relative Aluminum and Ferrous Metal Prices*

When compared with iron and steel, the picture is different. Aluminum is considerably more expensive on either a mass or volume basis. However, its much lighter weight (about 35 per cent of steel) enables aluminum to overcome some of this price differential, although its smaller strength generally requires greater thickness for sheet metal work.

As shown on Fig. 4, aluminum sheet costs about five times as much as sheet steel, pound for pound, but there is only a 2 to 1 price difference for the actual material used for a given application. A similar or better relation exists in the structural field, where aluminum switchgear structures have been built with the same size structural members.

[fol. 4801] 14. *Specific Strengths*

As a matter of fact, pound for pound, aluminum is not only the most conductive, but also the strongest of the common metals. Hard drawn aluminum of electrical conductivity grade is as strong as cold rolled steel, while the toughest of the wrought alloys of aluminum have specific tensile strengths (tensile ultimate strength divided by specific gravity) which exceed that of hard stainless steel. Below are typical values of specific tensile strengths for some metals and alloys:

Aluminum, 7075-T6	28.1
Aluminum, 2024-T4	24.6
Hard Stainless Steel, 302	22.7
Magnesium, Hard	21.3
Aluminum, Electrical Conductivity grade, Hard Drawn, EC-H19	10.0
Cold Rolled Steel, 1020	9.55
Copper, Hard Drawn	6.5
Aluminum, Electrical Conductivity grade, ¾ Hard, EC-H26	6.3
Aluminum, Electrical Conductivity grade, Annealed, EC-0	4.4
Copper, Annealed	3.6

15. *Aluminum Metallurgy*

It should be realized that when the term aluminum is used herein it is meant to apply broadly to the entire vast area of aluminum metals, particularly those in the electrical [fol. 4802] field. Pure aluminum metal by itself is of extremely little use. It is aluminum's versatile ability to combine with hundreds of combinations of different metals and produce hundreds of alloys of different properties tailored to specific uses that is its most valuable property. Aluminum is actually a system of metallurgy.

In its purest refined form aluminum has a conductivity of about 65 per cent, but is extremely weak and, of course, quite expensive to produce. The purest commercial form is electrical grade (EC) aluminum which has a minimum purity of 99.45 per cent and minimum conductivity of 61 per cent. EC aluminum is relatively weak in the annealed

state but can be heat-treated and cold-worked, as can most aluminum alloys, to attain required tensile strengths.

Aluminum is combined with many different alloying elements, but the principal ones are copper, manganese, silicon, magnesium, zinc and nickel. The properties of the various alloys derived therefrom are discussed in greater detail in the various sections of this report. In general, all the alloying elements add strength, but zinc alloys are the strongest, while nickel permits strength to be retained at high temperatures. Copper contributes good machinability, but lowers corrosion resistance. Silicon and magnesium are excellent for corrosion-resistance.

16. *Aluminum Properties*

In addition to the primary electrical property of excellent volume and weight conductivity and the important struc- [fol. 4803] tural property of high strength to weight ratio, aluminum and its alloys has other important characteristics which either reinforce or detract the suitability of aluminum for various electrical applications.

17. *Corrosion Resistance*

Resistance to atmospheric corrosion makes aluminum eminently suitable for outdoor applications such as fixtures, for conduit installations in areas where maintenance is infrequent, difficult or dangerous and for use as conduit and armored cable in plants, such as paper mills, with atmospheres highly corrosive to ferrous products.

However, the strong oxide formation which is responsible for aluminum's admirable immunity to atmospheric attack makes for connection difficulties which, although easily overcome, have been and still are the most potent deterrent to the general use of aluminum conductors.

18. *Galvanic Activity*

Aluminum's anodic position in the electrochemical or galvanic metal series makes its susceptible to destructive galvanic corrosion in the presence of strongly cathodic metals, such as copper. This tendency requires intelligent consideration and precautionary techniques when copper-alumi-

num joints are made in environments wherein such corrosion can take place.

[fol. 4804] 19. *Low Melting Temperature*

Relatively low melting temperature makes aluminum, particularly when alloyed with silicon, excellent for die-casting, a mass-production operation which enables aluminum fittings, condulets and connectors, as well as countless non-electrical items, to be produced competitively with ferrous equivalents which must be cast in sand or permanent molds.

20. *High Heat Conductivity and Emissivity*

High heat conductivity makes aluminum very suitable for enclosures. High reflectivity, an excellent property for aluminum insulating foil, is not good for electrical enclosures from which heat must generally escape. However, a dull coat of aluminum paint cures this trouble. However, high reflectivity (combined with good workability) makes aluminum ideal for lighting and heating reflectors.

21. *Non-Magnetic Property*

Energy losses within aluminum enclosures are further reduced by aluminum's non-magnetic property. This makes aluminum particularly applicable as enclosures for high current density members, especially for single phase enclosures.

22. *Non-Sparking Property*

The fact aluminum is non-sparking makes it a particularly valuable metal for use in hazardous locations. This property, combined with its light weight and castability, renders aluminum most suitable for explosion-proof fittings [fol. 4805] and enclosures, especially those of massive size.

23. *Good Workability*

Many cast and wrought alloys of aluminum have good formability and workability which reduces labor costs and makes aluminum useful for machined members.

24. *High Ductility*

Good ductility and relatively low strength in the annealed state permit aluminum to be easily drawn into wires and rods, to be extruded into myriads of cross-sectional shapes, to be deep drawn into cylindrical containers and to be spun to mathematical curvatures.

25. *Non-Toxicity*

Non-toxicity is hardly an electrical quality, but combined with aluminum's good heat-conductivity and workability it makes aluminum an excellent material for household utensils and electrically heated food containers.

26. *Appearance*

Good appearance is a highly subjective characteristic, but the silvery natural appearance of aluminum is attractive to many people and a not inconsiderable factor in its use and choice. In addition, aluminum is capable of taking on many unusual and colorful sheens and finishes by anodizing and dyeing processes.

[fol. 4806] 27. *Lightness*

Undoubtedly the popular characteristic quality of aluminum is its relative lightness—only 2.7 times the density of water, or roughly one-tenth pound per cubic inch. It would be difficult to select an application, outside of ballast material, wherein this property does not contribute favorably in such ways as decreased labor costs, lower shipping and handling costs, increased safety, and contingent economies realized in other materials (such as structural supports).

28. *Early Electrical Uses*

Aluminum has been used in electrical applications for over sixty years. The first application was bus bars in 1895.[3,8]—All-aluminum cable was used as far back as 1902. Steel-reinforced, aluminum transmission cable (ACSR) was first used in 1909.[7] Insulated aluminum cables were being manufactured in the 1920's.[9]

29. *Electrical Applications Today*

Before the end of World War II, electrical applications of aluminum were vitually unknown in the building industry, except for the use of aluminum bus bars for massive industrial installations, particularly in aluminum reduction plants. Today, the use of aluminum is extensive in all bus applications and gives promise of imminent breakthrough on various fronts in the cable field. This report is primarily concerned with reviewing the various factors in this trend and the present status of aluminum in the various areas of use. On the basis of the information in this report, study [fol. 4807] of the literature, conversations and conferences with manufacturers, engineers and contractors, and a poll of several hundred leading electrical contractors, the relative applicability of aluminum to various electrical products ranges from dominant to nil. The following list is an estimated appraisal of the relative favorable applications of aluminum, most favorable items are at the top of the list:

(1) High capacity low voltage buses.
(2) Transmission cable.
    (a) Long distance—(ACSR)
    (b) Urban use.
(3) Single Phase Enclosures (high capacity).
(4) Low Impedance Bus Risers—600 Amperes and over.
(5) Plug-in bus—600 amperes and over.
(6) Reactors
(7) Underground feeders in non-metalic duct (non-utility).
(8) High voltage switchyard bus structure.
(9) Outdoor Lighting Standards.
(10) Outdoor lighting fixtures.
(11) Switchgear and Switchboard bus.
(12) Armored power cable (larger sizes).
(13) Switch Enclosures (2,000 amperes and over)
(14) Large cables in conduit (over 200 amperes capacity)
(15) Cast Fittings (die cast)
[fol. 4808] (16) Cable Trays

(17) Medium size cables in conduit (#6 to #4/0)
(18) Conduit.
(19) Cast boxes (sand castings)
(20) Branch circuit Wiring.
(21) Interior lighting fixtures.
(22) General sheet metal enclosures.
(23) Power transformers.
(24) Distribution transformers.
(25) Signal wiring.
(26) Junction, outlet and pull boxes.

30. *Factors in Appraising Relative Favorable Use*

The above list should be considered only as a general guide. Economic application of aluminum depends on many factors other than material cost alone. Direct labor cost is the next most prominent consideration. However, true costs will also be affected by maintenance requirements, power losses and safety requirements. The extent to which these apply will, of course, vary for a particular installations. Thus, aluminum conduit, which at this time, is considerably costlier than steel, has been used in a recent feeder installation on the outer wall of a tall building because of maintenance and installation savings. Large switch enclosures are cheaper to purchase in steel, but magnetic power losses in the steel will more than offset the cost difference. On the other hand, cables of all kinds [fol. 4809] are cheaper in aluminum, but present new splicing problems, and for equal capacities often require larger conduit sizes.

In general, the first sixteen items will offer economic savings in aluminum, mostly on an initial cost basis, but also to varying degrees in labor, maintenance and other contingent costs. Among items (17) to (25), medium size cables in conduit can prove economical with the use of skillful labor. Likewise aluminum conduit for difficult installations. Branch circuit wiring (mostly #12 AWG wire size) has definite possibilities too little recognized at present. The remainder either await further technological development or at this time are too costly.

31. *Working with Aluminum*

A common disadvantage quoted by many experimenters and fabricators is the increased cost of working with aluminum. At the same time others will come forward with statements that labor costs are no greater and sometimes even less, or if they are greater, that reductions are expected as more experience is gained.

In general, it is our impression that the more optimistic views are held by those with greatest experience with aluminum, and that the greatest enthusiasm is manifested by those with the longest and most extensive records of working with aluminum.

It must be remembered that many aluminum joining and fabricating techniques are of relatively recent development and that most workers have little or no experience [fol. 4810] with these techniques. It is logical to expect continuing improvement and simplification in these methods on the one hand, and reductions in time and labor costs on the other in the face of increasing use and application.

Experience has shown that electricians easily learn how to splice and join aluminum by the various available methods from bolted to welded connections. The patent bugaboo of aluminum electrical connections has no longer a solid basis in reality. Likewise, with the proper tools and techniques, aluminum can be easily worked and fabricated in myriads of differing applications.

32. *Need for Educating Users and Workers*

Frequent conversations with various contractors and manufacturers reveal that many of them have what amounts to an ingrained reluctance to work with aluminum, although they have had little or no experience with aluminum. This stems from a natural conservative reaction to change in many cases, and in other cases to unfavorable experience resulting from using aluminum without sufficient knowledge of proper fabricating methods.

The passage of time will inevitably rectify this situation. However, considerable helpful impetus can result from properly directed and concentrated educational activity. On the one hand, this effort should be directed to teaching electricians and other skilled workers how to join,

fabricate, weld and work aluminum metals, so that labor inadequacy is no bar to economical utilization. On the [fol. 4811] other hand, the purchasers and users must be made more aware of the economic and other advantages of aluminum.

In particular, electrical contractors and consulting engineers should be made the targets of such educational and informative activities. Many contractors, because of ignorance or unfamiliarity, will unjustifiably increase cost estimates when aluminum conductors are specified. Consulting engineers, a most conservative breed, block the extension of aluminum use, often denying considerable savings to their clients, because of lack of information or because of the ingrained tendency to leave alone ancient specifications which have sufficed for countless previous jobs.

33. *Versatility of Aluminum*

Basically, aluminum is the most flexible of all metals and can be adapted to a tremendous variety of products and manufacturing processes. It can be drawn, bent, machined, forged, formed, spun and extruded. It can be riveted, brazed, flame-welded, arc-welded, flash-welded, resistance-welded and cold-welded. It can be painted, plated, specularized, brushed and anodized. It can be produced in a wide range of hardness, corrosion-resistance, machinability, ductility and strength.

However, this extreme versatility exacts a cost, and this cost is the need to be well-versed in the characteristics of the various aluminum alloys and in the techniques for their proper fabrication. The methods used with iron and steel [fol. 4812] or copper cannot be recklessly transferred to aluminum work. Aluminum is different, but it is not more difficult.

34. *Aluminum and the Future*

Aluminum is still in its vigorous, fast-growing youth, as indicated by the large annual increases which have occurred since World War II. New methods, new applications, improvements in existing techniques are being developed continuously. With the imminent exhaustion of long-mined copper and high grade iron resources in this country, alumi-

num looms as the metal of the future. To the entrepreneurs and manufacturers with the vision and initiative to accept and master the myriad applications of aluminum will go the rewards of the future.

Wire and Cable

The relative position of aluminum in the electrical sector of the economy will be determined in large measure by the extent to which aluminum is utilized as the conductor material in electrical wires and cables, still the dominant and characteristic electric material.

1. *Basic Advantages of Aluminum*

There are two basic significant factors today which are impelling aluminum to an ever larger portion of the electrical wire and cable market. Simply stated, these are as follows:

(a) Pound for pound, aluminum is more than twice as conductive as copper.

(b) The basic price per pound of aluminum during 1956 has been 55% to 65% that of copper. Now (March, 1957) after a precipitous drop in the price of copper, aluminum is at 80% of the copper price.

2. *Basic Advantages of Copper*

Opposed to these two great favorable factors are the two following disadvantages:

(a) The entrenched position of copper conductors.

[fol. 4815] (b) On a volumetric basis, the conductivity of copper is more than 1½ times as great as aluminum.

It is the interaction of these four general factors which explain the position of aluminum wires and cables today and which will determine that position tomorrow.

If choice were always made on the objective basis of a pure price comparison, it is safe to say that today aluminum conductors would be selected for most electrical installations, even though aluminum's lower volume conductivity, in many cases, requires larger conduit sizes and therefore higher conduit costs.

3. *Unfavorable Influences*

However it is the complex of influences arising from the long, practically exclusive use of copper for electrical wires and cables which in many cases offsets and brings to nought the apparent economic advantage of aluminum. These influences are exerted in many ways, both direct and indirect. A partial tabulation includes the following:

(a) Unwillingness on the part of many engineers, designers and contractors to take a chance on a new product (aluminum) as long as an old one (copper) performs satisfactorily.

(b) Resistance of electricians to learning the different handling and splicing techniques required for aluminum wires and cables.

(c) Inadvisability of introducing aluminum wires and cables in revisions of existing all-copper electrical installations.

[fol. 4816] (d) The fact that aluminum wires and cables are not yet such standard stock items as copper wires and cables.

(e) Unwillingness of suppliers to enlarge their inventory by duplicating their copper stock with additional stocks of aluminum wires and cables.

In general, the innate conservatism of engineers and designers will cause them to lose the economic benefits obtainable in many installations by using aluminum instead of copper. In many instances, such decisions are dictated by well-founded doubts concerning the ability of the electricians to make proper aluminum splices.

4. *Conductivity and Weight Comparison*

The fact that on a weight basis aluminum is greatly superior to copper as an electrical conductor comes as a surprise to many people who are automatically accustomed to regard copper as the standard of electrical conductivity and think of conductance only on an area basis.

Fig. 1 is a graphic illustration of the superior characteristics of aluminum on a weight basis. Although No. 4/0 aluminum conductor weighs about the same as No. 2 copper conductor, it is about 25% stronger (in the fully hard-drawn tempers), twice as conductive, has 1½ times the rated current capacity (type RH insulation) and will carry its rated current with less than 90% of the voltage drop of the copper conductor.

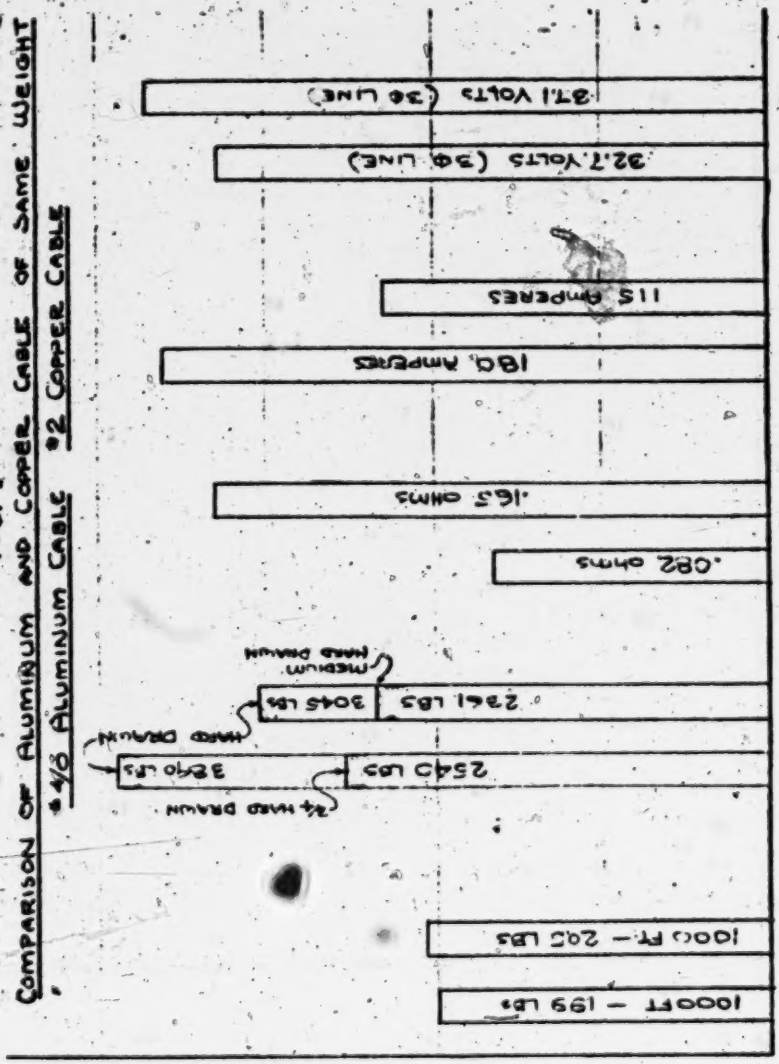
Remarks_____

FIG. 1

COMPARISON OF ALUMINUM AND COPPER CABLE OF SAME WEIGHT

#4/0 ALUMINUM CABLE #2 COPPER CABLE



[fol. 4818] 5. *Weight-Size Rule*

A similar graph can be derived for other corresponding sizes of copper and aluminum wires. As a matter of fact, a curious empirical relationship is observed if one compares the American Wire Gage number sizes with the approximate per unit length weights of bare aluminum and copper cables. This is, that an aluminum cable weighs about the same (always somewhat less) as a copper wire five number sizes smaller, as shown in the following tabulation:

Table 1

Aluminum and Copper Conductor Sizes of Equivalent Weight

Copper		Aluminum	
Wire Size A.W.G.	Weight—lbs per 1,000 ft.	Wire Size A.W.G.	Weight—lbs per 1,000 ft.
2	202.9	4/0	198.6
3	162.5	3/0	157.5
4	128.9	2/0	124.9
5	102.2	1/0	98.1
6	81.0	1	78.5
7	64.3	2	62.3
8	50.1	3	49.4
9	40.4	4	39.2
11	24.9	6	24.6
13	15.7	8	15.2
15	9.8	10	9.5

[fol. 4819] This relationship arises because of the method of derivation of American wire Gage sizes whereby there is the same geometric ratio between the areas of any two adjacent wire sizes. This ratio works out to 1.261, which raised to the fifth power is 3.20 or very nearly the ratio of the densities of copper and electrical grade aluminum which is 3.32.

6. Conductivity-Size Rule

This geometric relationship of the American Standard Wire Gage sizes gives rise to another convenient rule relating the corresponding conductivities and current capacities of aluminum and copper wires. The area relationship of wires two gage numbers apart is 1.261 squared or 1.59. Now this value is practically the same as the conductivity ratio of copper to aluminum based on the International Conductivity Standard, which is 99% to 62% or 1.60. Consequently, the rule is that aluminum wire has the same

conductivity as copper wire two sizes smaller. Since voltage drop for the smaller size cables in conduit is principally due to resistance (for No. 4/0 wire, resistance is .0534 ohms per 1,000 ft. and the resistance becomes comparatively greater as the wires become smaller), a practical rule is that an aluminum cable has the same voltage drop as a copper cable two wire sizes smaller. See table 8 for a tabulation of actual voltage-drop values.

7. *Current Capacity—Size Rule*

There is finally another approximate empirical rule, this one relating to rated current capacities. This rule is similar [fol. 4820] to the voltage drop rule. It states that an aluminum wire has a rated current capacity approximately the same as a copper wire two wire gage sizes smaller. This rule arises from the method of deriving wire sizes and the ability of wires to carry a given electric current.

Current carrying ability is limited by temperature rise rather than voltage drop. The temperature rise of the wire depends on the ability of the wire to dissipate the energy or heat loss caused by the flow of current within the wire. And this ability is practically a direct function of the peripheral area of the conductor and therefore of the diameter of the conductor. In Fig. 2 it can be seen that the allowable current carrying capacities recommended by the National Electric Code are nearly a linear function of the conductor diameter.

For an insulated aluminum and copper wire of the same diameter, the temperature rise and therefore the energy dissipation of their respective rated currents will be the same.

$$P_{Al} R_{Al} = P_{cu} R_{cu}$$

If the conductivities of these wires are taken as 61% and 99% respectively, then

$$P_{Al} = \frac{61}{99} P_{cu}$$

$$I_{Al} = \frac{I_{cu}}{1.27} = .79 I_{cu}$$

[fol. 4821]

Remarks

FIG. 2 RELATIONSHIP OF AREA AND DIAMETER TO RATED CURRENTS

FOR CLASS B STRANDED CONDUCTORS

BASED ON NATIONAL ELECTRIC CODE VALUES FOR 600V. INSULATED ALUMINUM CABLE IN RACEWAY

[fol. 4822] Thus, from a consideration of conductivities and heat energy generation alone, we note that an aluminum conductor has about 79% the current carrying capacity of a copper conductor of the same size. Actually, this value of 79% is a minimum value for use in 60 cycle power circuits and is true for the smaller sizes of insulated cable. It is found that for the larger cables skin effect is more pronounced for copper because of its greater conductivity. E. E. McIlveen has determined experimental values of A.C./D.C. ratios of 1.13 for aluminum and 1.23 for copper in tests on 1,500,000 CM cables in iron conduit.[3] However, the difference is considerably less for the smaller sizes of cables and practically negligible for those in the American Wire Gage range. Actually, the National Electric Code allowable current-carrying capacities tend to be above 79% for the larger cables (250 MCM and above) and below this value for the smaller sizes in type RH insulated conductors. These ratios are shown on Fig. 3.

Now, the American Wire Gage sizes are so devised that any wire diameter is 89% the diameter of the next larger one. Therefore, a wire two sizes smaller will have a diameter about 79% of the larger wire diameter. Since the current carrying ability of aluminum wires is about 79% that of copper, then an aluminum wire should have the same current carrying capacity as a copper wire two A.W.G. sizes smaller. This relationship is closely reflected by the allowable current carrying capacities of aluminum and copper conductors of the latest edition (1956) of the [fol. 4823] National Electric Code.

These are compared below for conductors with type RH insulation:

Table 2

Copper		Aluminum	
A.W.G. Size	Rated Capacity	A.W.G. Size	Rated Capacity
14	15	12	15
12	20	10	25
10	30	8	40
8	45	6	50
6	65	4	65
4	85	2	90
		1	100
2	115	1/0	120
1	130	2/0	135
1/0	150	3/0	155
2/0	175	4/0	180
3/0	200	250 MCM	205
4/0	230	300 MCM	230
250 MCM	255	350 MCM	250
350 MCM	310	500 MCM	310
500 MCM	380	750 MCM	385

[fol. 4824] Comparative ampere load ranges are shown graphically contrasted in Fig. 3.

Consequently we may postulate as a general design rule that an aluminum conductor will in all cases provide equivalent or better current carrying capacity and voltage drop than a copper wire two A.W.G. sizes smaller. However, it would be wrong to design an installation on this basis, that is, with the idea of replacing a pre-chosen copper conductor. Aluminum should not be treated merely as a substitute for copper conductors, but rather as a valuable electrical component on whose properties electrical design should be based directly.

Thus, for a 35 ampere load, we would select a No. 8 copper wire or a No. 8 aluminum wire, *not* a #6 aluminum wire which the previous table indicates to be the approximate equivalent of No. 8 copper wire.

8. *Load-Price Comparison*

All the foregoing discussion of copper and aluminum conductor equivalents are of considerable academic interest and serve to vividly illustrate comparative electrical and physical properties. However, for the practical design engineer, presented with two alternatives of equivalent technical merit, the question is simply one of economics. How much does each installation cost? Or, in the case of

electrical conductors, what are the costs to carry a given load by copper conductors on the other?

[fol. 4825] Fig. 4 presents an answer to this question in the form of a direct list price (June, 1956) comparison of copper and aluminum conductors with type RH insulation to carry a given electrical load. Voltage drop has not been considered. In general, it will be the same for either copper or aluminum conductors, as previously explained and as shown in Table 3. No other costs have been considered. Handling costs should be about the same or favor aluminum because of its lighter weight. Splicing costs will be higher for aluminum. Installation (pulling) costs will tend to be equal, since the lighter weight of aluminum will tend to cancel out the effect of its larger size. To a considerable extent, the cost of splicing, which is discussed later in this article, will depend on the skill and familiarity of labor with proper aluminum splicing procedures. All in all, lumped labor and overhead costs should not vary greatly and, consequently, their difference will not be an important factor in an economic comparison. For all practical purposes, the comparative list price cost of the cables will be the prime determining economic factor.

9. *Types of Cable Installations*

Since the cost of conductors alone is being considered, it is obvious that the conclusions drawn from Fig 4 will apply only to feeder installations which do not use metallic conduit. Such installations will include the following:

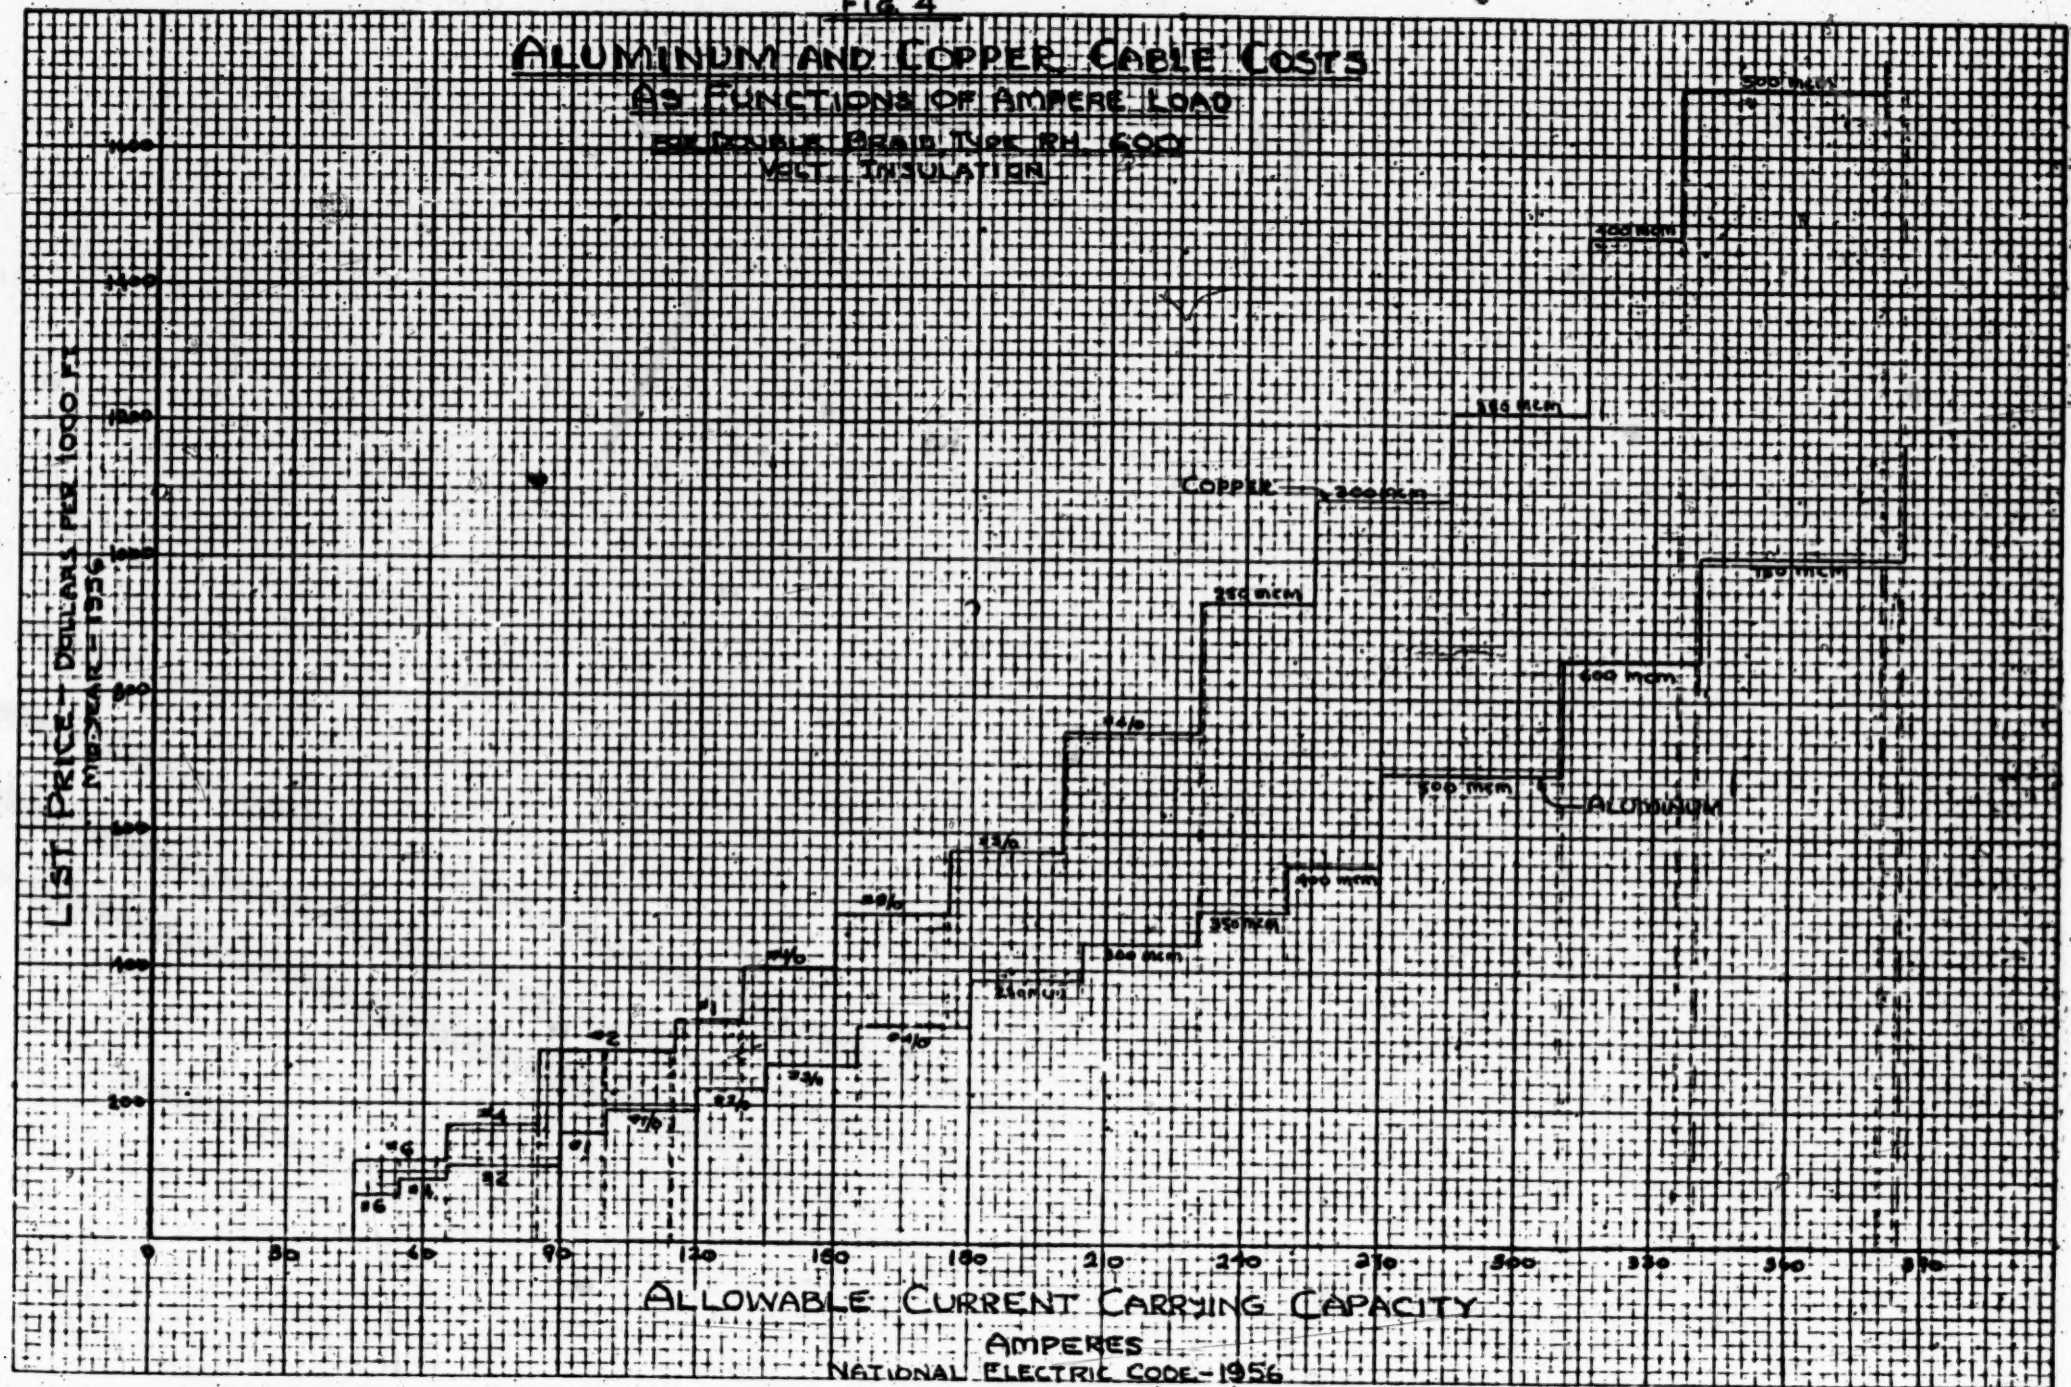
FIG. 4

ALUMINUM AND COPPER CABLE COSTS
AS FUNCTIONS OF AMPERE LOAD
FOR DOUBLE BRAID TYPE RH 600 VOLT INSULATION



(a) Open wiring. This would apply to wiring on insu-
[fol. 4828] lators, cleats, pole lines and racks. The cost of larger holding and clamp devices required will tend to be canceled out by the lighter weight of aluminum which requires fewer or less rugged supports.

(b) Wiring in fiber conduit. Such conduit is relatively inexpensive and is generally used in large standard sizes, usually 4-inch, for a large range of cable sizes. In general, costs for a fiber duct installation (less the cables) particularly if concrete-encased, would be about the same for either copper or aluminum cables.

10. *Cost Rates—Copper to Aluminum Cables*

The Copper to Aluminum cable cost ratios as a function of a range of given loads is shown tabulated below and plotted in Fig. 5.

[fol. 4832] From these data it can be seen that on a per ampere basis copper cable ranges generally from about 50% to 100% more expensive than aluminum cable. The irregularities in the curve are, of course, due to the necessary discontinuities in a range of wire sizes. However, a general trend can be noted. The economic advantage of aluminum appears to be a maximum in the range around 250 amperes and is less for smaller and larger loads, although larger loads in general appear to have higher cost ratios.

As might be expected, the price ratio curve is to a considerable extent a reflection of the weight ratio curve, which is shown plotted in Fig. 6. The favorable peak is not so marked for weight as for price, but it occurs at about the same range—in the area of 250 amperes. In general, copper cables with type RH insulation weigh about 40 to 80 per cent more than do aluminum cables of the same carrying capacities, the more favorable ratios being in the range of larger cables.

For a lighter insulation, such as type T (plastic) the ratio curve will approach more closely to the equal conductivity line. For heavier insulation, the reverse will occur.

These price and weight tendencies are readily explained.

In the smallest sizes the favorable basic cost and weight of aluminum conductors are relatively small portions of the total cost and weight of the wires. In the largest sizes, there is a relatively greater circular mil per-ampere increase for aluminum than for copper, because the current

[fol. 4834] capacity tends to increase directly as the cable diameter rather than the area and because of the greater increase of skin-effect in larger cables.

Figures 5 and 6 are for cables with 600-volt RH insulation and reflect a more favorable comparison than for cables with thicker insulations and more expensive protective coatings. However, significant savings will be realized with practically all types of cables (see section of this report on interlocked armor cable, for example) although the percentage savings will be lower for cables in which the cost of the basic conductor metal is a smaller part of the total cable cost.

11. *Overhead Distribution*

The economic advantage of aluminum as a cable conductor has only lately begun to affect the vast building construction field, but has been recognized for many years in overhead distribution lines where the use of aluminum cable is practically standard.

There are records of the use—aluminum conductors for transmission lines as long ago as the turn of the century on both East and West Coasts.[6] In the 1920's the use of steel reinforced aluminum cable for long span transmission lines began to be quite general and is now practically universal despite the fairly complicated double splices required by this cable.

[fol. 4835] The extended use of all-aluminum transmission cables, particularly in short span urban distribution, has become fairly standard with many utility companies during the past 10 years under the twin impacts of the copper shortage and the increasingly favorable economics of aluminum installations. Connector troubles have been largely solved, and connectors and connecting techniques continue to improve. A large proportion of the all-aluminum cables in this area are used for services.[8]

The economic advantage of bare all-aluminum cable over bare all-copper cable will, of course, be more marked than for insulated cable, wherein the larger aluminum cable is penalized by the cost of more insulation. In the distribution field comparative costs will tend to approach more closely equal carrying capacity costs. Another large savings at-

tributable to the lighter weight of aluminum conductors results from the need of fewer or less sturdy supporting towers and pole structures.

12. *Conduit Requirements*

In office and industrial buildings the usual cable installation is in conduit. Since for equivalent loads, aluminum cables will in most cases require conduit one size larger than a copper cable installation, the combined cost of cables and conduits must be considered in any comparative economic analysis.

Fig. 7 is a comparative chart showing conduit sizes required for copper and aluminum cables with type RH insulation for three and four conductors per conduit for loads from zero to values in the 300 and 400

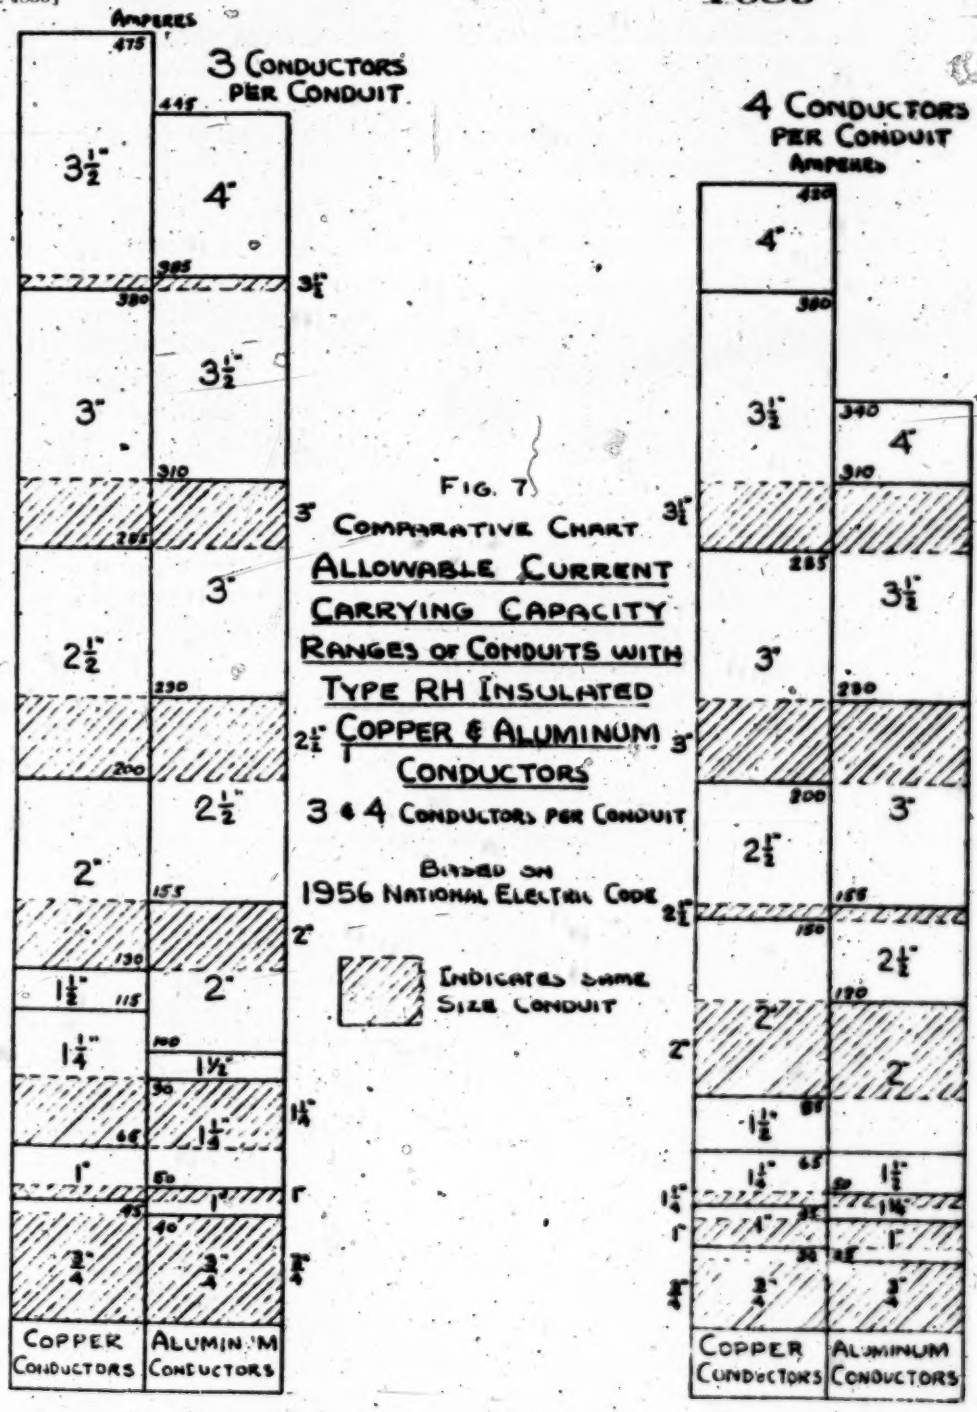

FIG. 7

COMPARATIVE CHART

ALLOWABLE CURRENT CARRYING CAPACITY RANGES OF CONDUITS WITH TYPE RH INSULATED COPPER & ALUMINUM CONDUCTORS

3 & 4 CONDUCTORS PER CONDUIT

BASED ON 1956 NATIONAL ELECTRIC CODE

INDICATES SAME SIZE CONDUIT

[fol. 4837] ampere range. The cross-hatched areas mark those load ranges within which no change of conduit size is required when using either aluminum or copper conductors. From an inspection and analysis of the two graphs the following pertinent facts and relationships emerge:

(a) In the greater portion of the load range, the use of aluminum conduit will require the next larger conduit size.

(b) However, in certain load ranges, the same conduits may be used for either aluminum or copper conductors. In the range from zero to 380 amperes (allowable carrying capacity for 500 MCM copper cable) these ranges are a considerable fraction of the total.

(b-1) 3 conductors per conduit: 140 amperes or 37%
(b-2) 4 conductors per conduit: 135 amperes or 36%

(c) In the shaded areas the use of aluminum wires and cables should be most advantageous, since they are not penalized by the additional costs of larger conduits.

(d) The favorable areas appear to be more concentrated in the lower portion of the total load range. In the zero to 50 ampere ranges, the following load percentages will be able to use the same size conduits with either aluminum or copper wires:

(d-1) 3 conductors per conduit: 90%
(d-2) 4 conductors per conduit: 80%

13. *Combined Cable and Conduit Costs*

Since the combined costs of cable and conduit must be compared when considering aluminum cables for the usual [fol. 4838] building installation, these costs have been determined for three type RH insulated conductors in conduit over the normal load range. The results for this type of feeder should be quite typical of the results which would be obtained for 4-conductor feeders and for other insulations, such as plastic and varnished cambric.

Table 5 on the following page compares material costs for power feeders over the 40-380 ampere range for aluminum and copper conductors based on January, 1957, prices. It should be noted that at this time (March, 1957) a 5 per cent decrease has occurred in the price of copper cables and a 3 per cent increase in the price of steel conduit. The

effect of these price changes will be to reduce the material cost ratio in favor of copper conductors by about 5 percentage points in the larger feeder sizes and progressively less for the others to about 2 or 3 percentage points for the smallest sizes. All in all, these changes will not alter appreciably the general trend, which is more clearly indicated by the plotted material cost curves of Fig. 8.

The tabulated and plotted data indicates that feeder costs show no consistently advantageous trend for either metal for loads of 200 amperes or less, although, even in this range, aluminum conductor feeders in most cases will cost less than the equivalent feeders with copper conductors. However, above the 200 ampere mark, aluminum conductor feeders in all cases are distinctly more economical by amounts ranging from 18

[fol. 4841] to 39 per cent.

14. *Aluminum Cables in Aluminum Conduits*

The same treatment was applied to aluminum cables in aluminum conduits in a comparative analysis with copper cables and steel conduit. The resulting data and ratios are shown tabulated in table 6. Here again a similar but less favorable trend is noted. Here also, the recent price changes will lower the material cost ratios in favor of copper conductors in steel conduit, but not as much, since the price of aluminum conduit has not changed. The material cost ratios for aluminum cables in aluminum conduits have been plotted on Fig. 8 in the favorable range for loads above 200 amperes. These ratios indicate total material costs 11 to 29 percent (7 to 25 per cent as adjusted) greater for copper cables in steel conduits.

15. *Evaluating Labor Costs*

This favorable area has been isolated and expanded on Fig 9, and an attempt has been made to evaluate labor costs as well, so that the total cost picture may be obtained and a true evaluation of the total comparative economic picture determined. Only on the basis of total combined labor and material costs can an economic choice be made. Consequently such an evaluation has considerable practical value for the consulting engineer and electrical contractor.

16. *Conduit Installation Cost*

The problem of evaluating labor costs is a difficult one and

TYPE RH INSULATION

LOADS BASED ON
1956 NATIONAL ELECTRIC CODE
3 CONDUCTORS PER CONDUIT

FIG. 9 - ALLOWABLE CURRENT CAPACITY.

[fol. 4844] highly subjective, although it is the crux of a successful contractor's operations. In Section No. 1 of this report on "Conduit" the matter of comparative conduit costs has been discussed and the labor costs quoted by a reputable and experienced electrical contractor have been used to obtain total comparative costs of aluminum and steel conduit costs. The same labor costs have been utilized in this analysis as well.

17. *Cable Installation Costs*

Cable installation costs are even more involved and subjective than conduit costs, since, along with varying working conditions, there are additional variables such as different cable-pulling lengths and varying numbers of cables per pull. To attempt to obtain an average for the almost infinite number and variety of pulling situations would hardly be possible or worthwhile. Various sources and authorities [9,10] have developed labor cost data and curves on this subject. These, however, must be applied with great care to any particular set of circumstances. Estimates on a cost per foot basis obtained from a number of contractors show considerable variation among themselves and with published data. Yet, such is the diversity of conditions that all of them could be right.

Consequently, it was decided that the most sensible course was to obtain comparative costs for the installation of aluminum and copper cables under identical conditions from a single experienced and reliable contractor. These conditions were simply a straight pull of 3 conductors into [fol. 4845] 100 feet of conduit. Connection costs were not evaluated, since with modern connectors and techniques these costs should not be too different and would, in any event, have small effect on the overall costs.

For pulling aluminum and copper cables of the same size, quoted labor costs were 6 to 15 per cent greater for copper cables ranging from No. 4 to 750 MCM sizes with the larger savings in the larger sizes. It is believed that this is a conservative estimate. Other contractors with aluminum cable experience have indicated greater relative savings. Further investigation is required in this area to obtain more reliable and accurate comparative labor cost data.

With relatively small labor cost differentials for the same sizes, cable pulling costs per ampere turn out to be generally higher for aluminum for some sizes and lower for others. The following is a partial tabulation of relative pulling costs for equivalent capacity cables:

Cable Size		Pulling Cost	
Copper	Aluminum	Copper	Aluminum
250 MCM	350 MCM	1.00	0.95
300 MCM	400 MCM	1.00	0.94
350 MCM	500 MCM	1.00	0.925
400 MCM	600 MCM	1.00	1.02
500 MCM	750 MCM	1.00	1.13

[fol. 4846] This particular contractor considers it 13 per cent more expensive to install 750 MCM aluminum cable as compared to 500 MCM copper cable. Another contractor who was queried indicated that the cost would be about the same in view of the considerably lighter weight of the aluminum conductors. On Fig. 6 it can be seen that the copper cables weight 71 percent more.

18. *Overall Material and Labor Costs*

At any rate, considering it better to err on the conservative side, these labor cost figures were added to the material cost prices and the total cost indices were obtained for copper cables in steel conduit, aluminum cables in steel conduit, and aluminum cables in aluminum conduit. These values are tabulated in table 7 under the respective column headings CS, AS and AA. The total costs for each of these three alternatives have been plotted on the upper portion of Fig. 9

These curves indicate that the inclusion of labor costs will in most cases cut the economic margin favoring an aluminum cable installation, except for those load ranges where larger conduit is not required to house the aluminum cables. Within these ranges the total overall savings for aluminum will increase, although the overall savings percentage will decrease.

19. *Aluminum Conduit Economies*

Another interesting observation is that the use of aluminum conduit adds little or nothing to the overall cost. As a matter of fact for the

[fol. 4848] contractors who have indicated greater labor savings than those used in this analysis, the use of aluminum conduit in this favorable range should actually lower overall costs.

The savings realized by the use of aluminum conduit is not only in the direct labor required to handle and work on the conduit, but also in the labor and material savings resulting from the reduced support requirements. The latter economy would be especially significant for large horizontally or vertically supported conduit banks. The overall weight savings of an all-aluminum installation over a copper cable-steel conduit installation, or even an aluminum cable-steel conduit installation, is generally better than two to one as can be seen by the data in table 5. In table 4, it will be noted that no particular weight advantage is gained by using aluminum cables in steel conduit. The basic reason is that the weight of the conduit is the major portion of a cable-conduit installation, ranging from about 55 to 80 per cent of the total weight of the installation, even for copper cables.

A more graphic picture of the comparative weight relationship is provided by Fig. 10, wherein overall weight for a 3-cable feeder is plotted as a function of load for all-aluminum and copper-steel cable and conduit installations. A similar curve for aluminum cables and steel conduit would generally follow the copper-steel curve.

For a more thorough discussion of estimated labor savings by the use of aluminum conduit, see Section No. 2 and 12 of this report.

[fol. 4850] Relative material, labor and overall costs have been tabulated on table 6 for copper cables in steel conduits and aluminum cables in both steel and aluminum conduits, with all costs for the copper cable installation reduced to the reference index of 1.00. Again, it should be kept in mind that the recent copper price change will tend to raise the aluminum cable indices 2 to 4 points, but that there is strong reason to believe that greater labor cost economies are possible for both aluminum cables and aluminum conduits.

20. *Branch Circuit Wiring*

Electrical contractors and consulting engineers appear to believe almost dogmatically that aluminum is out of the question for the small size wires used for branch lighting and appliance circuits. This oddly fixed belief, amounting almost to unanimity, seems strange in view of the hard facts revealed in Figures 7 and 11.

In Fig. 7 we note that larger conduits are not required for 3-phase, 4-wire circuits using aluminum wires for loads up to 25 amperes. In Fig. 11 we see that at current prices, aluminum wires, size for size, in the common type RH and type TW insulations cost from about 60 to 80 per cent of their copper equivalents. Since for small loads under 15 amperes (the usual range for branch circuit wiring) an aluminum wire installation will not be penalized by larger wire or conduit requirements, this full price savings can be immediately applied to such an installation.

FIG. 11 - RELATIVE PRICES OF ALUMINUM AND COPPER BRANCH CIRCUIT WIRES MARCH 1957

[fol. 4852] Consequently, a copper wire installation must justify itself by factors other than purchase cost. These factors are as follows:

(a) Lower voltage drop.
(b) Greater current capacity.
(c) Easier splicing, resulting in lower labor coats and better connections.

21. *Branch Circuit Voltage Drop.*

Voltage-drop tables [111] indicate the following voltage drops per 1,000 amp-ft. for solid aluminum and copper wires, sizes 12 and 10 A.W.G. the size commonly employed in branch circuit wiring:

Wire Size	Copper	Aluminum
#12 A.W.G.	1.85	2.69
#10 A.W.G.	1.16	1.83

These are line-to-ground voltage drops and are for the multi-wire branch circuits consisting, in general, of 3 circuit wires with common neutral. If voltage drop be limited to a total of 1½ per cent from panel to fixture, the following table indicates the maximum lengths of multi-wire branch circuits for a 12-ampere load:

Table 8

Maximum Lengths of Multi-wire Branch Circuits to Limit Voltage Drop to 1½ per cent of Line Voltage

	Aluminum Wires		Copper Wires	
	120-V. Circuits	277-V. Circuit	120-V. Circuit	277-v. Ckt
#12 A.W.G. Wires	50′	115′	80′	185′
#10 A.W.G. Wires	80′	185′	130′	300′

[fol. 4853] Since probably over 90 per cent of branch circuit wires are size 12 A.W.G., the comparative properties of aluminum and copper wires in this size are of most importance. From table 7 we note that No. 12 aluminum wires are limited to 50 ft. by the load and voltage drop requirements as compared to 80 ft. for copper wire for 120 volt circuits. However, the permissible circuit length changes to 115 ft. for 277 volt circuits.

Ordinarily, branch circuits will not exceed the latter distance from their panel. Consequently, it is not expected that voltage drop will prove to be a limitation to the use of

aluminum # 12 A.W.G. wire for these higher voltage circuits, which are achieving ever wider use throughout this country, particularly in office and industrial buildings. Nowadays, practically all office buildings of any size utilize 277/480 volt distribution and lighting systems, as do most large industrial buildings. For these structures, aluminum branch circuit wiring should prove particularly applicable and economical.

22. *Current Capacity*

The 1956 National Electric Code sets the allowable current carrying capacity of aluminum wires with the common building types of insulation (code rubber, heat-resistant rubber and thermoplastic insulations) at 15 amperes. Previously, this allowable load was greater, and undoubtedly aluminum wire at its allowable 15 amperes will run cooler than will copper at its allowable 20 amperes, since the fully [fol. 4854] loaded aluminum wire will generate less heat energy.

To what extent is this load limitation detrimental? For some appliance branch circuits where a full 20-ampere capacity is desirable, the application of No. 12 A.W.G. aluminum wires will be definitely limited.

However, a properly designed appliance branch circuits should in practically all cases be able to use aluminum wires. Fifteen ampere circuits for appliances may be permitted twice the maximum voltage drop of lighting circuits without appreciably impairing their effectiveness. For larger loads, #10 A.W.G. aluminum wire with 25-ampere circuit breakers or fuses can be used. It should be noted that an important municipal code, such as the Electrical Code of the City of New York, limits appliance branch circuit protective devices to 25 amperes,[12] thus utilizing the full allowable current-carrying capacity of No. 10 A.W.G. aluminum wires for this application.

High-voltage (277-V.) lighting circuits, particularly in office buildings, will generally carry fewer amperes than 120-volt circuits. Actual loads are in practice limited by control requirements and code limitations on the maximum number of fluorescent lamp auxiliaries.[12] Consequently, fifteen ampere circuits are eminently suitable for this ap-

plication and #12 A.W.G. aluminum wires will generally operate well within their recommended voltage-drop and current-carrying limitations.

[fol. 4855] 23. *Branch Circuit Splicing*

Branch circuit splicing is the great "bete noire" of aluminum wire application in this field. Countless contractors and consulting engineers shudder at the very thought. Even the connector manufacturers, who have, most laudably, pioneered and developed connectors and lugs for the larger wire and cable sizes, appear for the most part to have kept away from a thorough investigation in this area. Actually, the present reality at this time is far different from the horrendous picture imagined by most contractors and engineers.

The original source of these fearful ideas lay in the admitted inadequacies of aluminum building wire in the early years of its development. In 1947 when aluminum branch wiring was installed in ALCOA's great rolling mill in Davenport, Iowa, there were considerable complaints from the electricians because of the brittleness of the hard drawn wire and its tendency to break off at the ends. When aluminum branch circuit wires were installed in the ALCOA building in Pittsburgh five years later, these complaints had largely vanished.

The reasons were two-fold—(1) The mechanical properties of the wires had been greatly improved so that greater flexibility was combined with adequate strength. (2) Greater pains and efforts were expended to teach the electricians the proper handling and splicing methods for small, as well as large, aluminum wires.

[fol. 4856] 24. *Bendability of Aluminum Wire*

Even today, considerable trouble will be encountered if one attempts to treat aluminum wire as if it were copper wire. Aluminum wire in the common commercial tempers is adequately flexible for end connections. It can be bent back and forth many times before breaking, as any one can ascertain. However, it will break long before standard annealed copper wire. This breakage appears to be aggravated by the tendency of aluminum to bend in a smaller

radius than copper. The sharper bending increases the stress concentration and leads to more rapid rupture.

25. *"Notch Sensitivity"*

Breaking will also be greatly hastened by notches or nicks on the stressed area. This so-called "notch effect" or "notch sensitivity" is a complex function of the mechanical properties of a material. It appears to derive from the combination of relative compressive, tensile and yield strengths. In general, rupture during bending is more likely to occur in materials with yield strengths close to their ultimate tensile strengths. In this respect standard annealed copper is supreme since it has no well-defined yield point, but yields gradually from about 6,000 psi to its ultimate strength of 32-34,000 psi attaining a total elongation before rupture of 40-60 per cent.[13]

Aluminum in the fully annealed state yields a total elon- [fol. 4857] gation of 23 per cent.[14] However, the elongation is considerably reduced as the hardness of the temper is increased until a minimum of 1.5-2.0 per cent is reached in the fully hard-drawn condition, where notch sensitivity is greatest.

In the three-quarter hard and intermediate tempers, which are commonly used for building wires, an effective compromise appears to have been reached between strength and end-breakage tendency.[1] However, the tendency is still here and the intelligent contractor and workman will exercise simple and effective handling and installation methods to minimize it. Experience and common sense recommendations are as follows:[15,16]

(a) Heavy or sharp objects should never be thrown or piled on aluminum wire coils.

(b) Insulation should be stripped off the ends by "paring-off" instead of "ringing" the wire. The latter method is much more liable to nick the conductor.

(c) Wire ends should be twisted and bent as little and as few times as possible while making the splice.

(d) Use round-nose pliers whenever bending the end of the bare wire into a loop or hook.

These simple precautions have eliminated the problem of end-breakage in recent aluminum wire installations.

[fol. 4858] 26. *Splicing Methods for Aluminum Branch Circuit Wires*

All the above precautions and operations are preliminary to the actual splicing of the wires. This has been and can be accomplished in a number of ways which include the following general methods:

(a) *Soldering.*[12] This can be readily done with modern solders and fluxes which eliminate the troublesome oxide film. However, the flux residue is corrosive and must be wiped away carefully. Also, the quality of the connection will depend to a great degree on the skill and conscientiousness of the electrician. As a result, this method is not generally used.

(b) *Welding.* This method has provided excellent pigtail connections. A battery-operated portable welder fuses the twisted wire ends into a solid connection within a carbon electrode cup.[15] An excellent electrical joint results, but this method, which was used in the early portion of the branch circuit wiring installation in the ALCOA building is somewhat inconvenient because of the heavy portable equipment, and the additional preparation required by the pigtails.

(c) *Compression Sleeves.* A close fitting sleeve, usually of aluminum is placed around the 2, 3 or 4 ends of the wires to be spliced together. Then a compression tool applies either an indent or circumferential squeeze which brings the wires together into a close, almost cold-welded union.

[fol. 4859] (d) *Bolted Connections.* This is generally a split-bolt connector of tin-plated copper alloy material. A spacer is often employed on tap-offs or two-wire splices.[17] It is the simplest and easiest to apply and is achieving wider use for both aluminum to aluminum and aluminum to copper splices.

For all the above splicing methods, indeed for all splicing, whether copper or aluminum is involved, the joined surfaces should first be thoroughly cleaned, generally by abrasive rubbing or scratch-brushing. In the case of the compression and bolted connections the persistent oxide

coating of the aluminum conductor must be scratch-removed through a coating of compound which will prevent oxide reformation on the abraded aluminum surface. This is most important, particularly for split-bolt connectors, and will usually spell the difference between a good and bad splice.

27. ALCOA Building Branch Circuit Wiring Installation

The most notable example of an aluminum branch-circuit wiring installation in recent years is the ALCOA building in Pittsburgh, home office of the Aluminum Company of America. After initial use of the carbon-electric welding method, all small wire splices in junction and outlet boxes were made with common split-bolt connectors. This method has been fully justified by four years of service and is at present the splicing method used when system or maintenance changes are required.

[fol. 4860] The actual technique used by the electricians consists of paring-off the end insulation as described above, cleaning the wire ends with abrasive cloth dipped in ALCOA No. 2 joint compound, and then inserting the ends into the split bolt connector and tightening it. Practically, the only additional labor is the extra motion to dip the abrasive cloth into the joint compound.

Some additional observations are illuminating and will tend to dispel the almost mystic and fearful haze surrounding this subject. Although all branch circuit wiring is No. 12 A.W.G. aluminum, the fixture leads are copper, usually No. 16 A.W.G. These, however, are treated the same as the aluminum wires. The most common joint consists of 2 or 3 No. 12 aluminum wires and a copper fixture wire held together by a split bolt connector. No separators or spacers are used. Even more surprising, it was noted that the split bolt connectors were the bare copper alloy type recommended only for copper wire connections, rather than the tin-coated connector with spacer recommended for aluminum or mixed wire joints by the manufacturer.

When queried, the chief maintenance engineer indicated that this type of connection had proved itself in use and, consequently, he saw no sense in going to more expensive and cumbersome connections.

Why this is so may be readily deduced from a considera-

tion of the properties and behavior of aluminum wire in this particular environment. In the first place, the branch circuit wiring is generally lightly loaded and the entire [fol. 4861] building is air-conditioned, consequently, there are no large heat-cycling extremes to progressively destroy copper to aluminum connections. The splices are able to "breathe" readily within their elastic limits without causing plastic deformation of the aluminum wires. Secondly, corrosion between the two metals does not exist because the two necessary elements—moisture and electrolyte—are not present.

28. *Another Pigtail Splice*

Another way of making pigtail splices, used in the great Canadian Kitimat installation, is to apply individual indented symmetrical and asymmetrical aluminum terminal lugs to the ends of each wire and then bolt the group together.[19] A very compact joint is obtained, but the labor cost is considerably higher.

29. *Screw Terminal Connections*

A few words should be added about the connection of aluminum No. 12 and 14 A.W.G. wires to screw terminals. This can readily be done either by indenting an aluminum terminal lug to the end of the wire or by forming the end of the wire into a neat closed circular loop with the aid of round-nosed pliers.[19] In the both cases, scratch brushing under compound of the end connections precedes the actual screw-tightening of the wire end to the copper terminal, which is also scratch-brushed under compound.

[fol. 4862] 30. *Cold-Pressure Butt Welding of Wires*

A very interesting method, recently developed, for joining solid electrical wires is by means of cold-pressure butt welding.[36,37,38,39] This technique is extremely versatile since it can be applied with equal facility not only to aluminum wires, but also to copper wires and to the joining of either metal to the other.

The union of the wires is effected by buttwelding the two ends by the application of great pressure under carefully

controlled conditions. This operation is accomplished in less than half a minute in a specially designed tool which accurately cuts and squares the ends of the wires and then butts them together to effect a weld of the same cross-section as the wires being joined.

The resulting union is a true weld in the sense that a homogeneous crystalline structure results with physical qualities unimpaired. Indeed, an aluminum joint because of the cold work is stronger than the unaffected members on each side. Furthermore, so perfectly are the wires joined that the weld is scarcely visible once the easily removable weld flash is cut away. The joined section of wire may be flexed and twisted to a considerable degree without failure.

Presently available are light portable hand tools which are capable of welding aluminum wires in a wide range of sizes. Commercial A.W.G. sizes Nos. 18 to 8 may all be welded with a single tool equipped with cutter and interchangeable dies. Because of its early development and [fol. 4863] because the nature of the operation requires carefully machined dies and precise operation, this tool is still relatively expensive. However, the manufacturers expect to reduce the cost with further development and quantity production.

The possibility exists of developing relatively simple plyer-like tools for use on only a single size of wire of the more popular sizes. The most obvious would be No. 12 A.W.G. size, which in large commercial buildings will constitute about 95% of the total wire footage.

A deterrent to present use of this technique in general building wiring is that butt-welding can necessarily be applied to only two wires. For uniting three or more wires at a common joint a lap-weld must be used and this type of cold-pressure weld is not as satisfactory as butt-welding, because of the labor of scratch-brushing the individual wires and the danger of surface contamination which will produce a defective weld. Until an effective and inexpensive way is developed for making multiple wire joints, it is improbable that cold-pressure joining will make much headway in the electrical construction trade, even with aluminum wiring.

31. *Branch Circuit Wiring—Conclusions*

Thus, it is seen that the splicing of aluminum branch circuit wiring by a variety of techniques is readily learned and applied, and has been proved by many years' use in existing installations. It is doubtful if the use of aluminum branch [fol. 4864] circuit wiring should result in appreciably increased labor costs, if properly trained electricians are employed. Moreover, any small increase would tend to be reduced by the easier handling inherent in the lighter aluminum wire.

Consequently, there is reason to believe that appreciable savings, equal to the material cost difference of aluminum and copper No. 12 A.W.G. wires, can result from a properly executed aluminum branch circuit wiring installation.

A further look at the relative wire prices of Fig. 10 indicates possible material cost savings of 29 per cent for No. 12 A.W.G. type RH wire and 33 per cent for No. 12 A.W.G. type TW wire. As expected, thermoplastic insulated aluminum wire with its less expensive insulation shows a relatively greater saving. Somewhat surprising is the relatively high price of No. 10 A.W.G. type RH aluminum wire, which is 81 per cent of the copper wire price compared to about 60 per cent when thermoplastic insulation is used. This may be largely explained by the fact that No. 10 RH wire has 50 per cent greater insulation thickness than No. 12 RH wire (3/64 inch vs 2/64 inch) whereas Nos. 12 and 10 thermoplastic insulated wire have the same insulation thickness (2/64 inch).

32. *EC Aluminum*

Aluminum wire and building cables are drawn from almost pure aluminum, which is commercially designated as EC aluminum. Minimum percentage of aluminum is 99.45% [fol. 4865] and minimum electrical conductivity is 61% of the international annealed copper standard. At the present time, information from the Aluminum Company of America indicates that actual purity and conductivity are generally about 99.65% and 63% respectively.

In its annealed state EC aluminum is designated EC-0 and is remarkably ductile with low tensile strengths—about

4,000 psi yield strength and 12,000 psi ultimate strength. After a complete handdrawn wire-forming operation; the hardness and strength of the aluminum has greatly increased and its ductility has decreased. Ultimate tensile strength is about 27,000 psi and yield strength is about 24,000 psi. This fully hard-drawn state is designated EC-H19.

Since this temper is too brittle to be readily used for building wire applications, it is necessary to partially anneal the wire in order to improve its handling ability, particularly its bendability, and to decrease its brittle breaking tendency.

Most aluminum building wire and cable is presently manufactured in the three-quarter hard temper, (EC-H26) or the intermediate temper (EC-H24). The former has a tensile strength ranging from 17,000 to 22,000 psi and the latter from 15,000 to 20,000 psi. Yield strengths run about 2,000 psi less than ultimate strengths.

33. *Aluminum Wire and Cable Pulling*

A recent poll of electrical contractors with aluminum cable experience indicated that well over half considered [fol. 4866] it unnecessary to take additional precautions when pulling aluminum cables because of their smaller tensile strength. (See Section 12 of this report). However, over one-third maintained that additional precautions were necessary.

The question arises, why this contradictory division of opinion? A consideration of the stress-strain curves of aluminum and copper provides an explanation. Fully annealed copper appears to reach its elastic limit at about 5,000 psi but can then stretch on and on (40-60%) to about 34,000 psi before rupturing.[12,3] Three-quarter hard aluminum departs from a linear stress-strain relationship at about 10-11,000 psi, but will yield after this point only a small fraction of the elongation of copper before rupturing at its ultimate strength of 17-22,000 psi.

34. *Recommended Pulling Stress*

Actually at the maximum recommended pulling stress for annealed copper wires, 10,000 psi, copper wire will have stretched about five times as far as aluminum wire, most of it inelastic deformation.[3] Consequently, the same allowable pulling stress appears to be satisfactory for aluminum wires and cables. As a matter of fact, at the huge Kitimat power plant and aluminum reduction installation of the Aluminum Company of Canada, an all-aluminum wire and cable installation, the maximum recommended pulling tensions were based on a stress of 10,000 psi.[19] Wire temper was three-quarter hard.

[fol. 4867] Thus, electrical contractors may safely stretch copper wires and cables well past their elastic limit, indeed; although it is inadvisable, they may even exceed considerably the recommended maximum pulling stress of 10,000 psi, without rupture. This latitude is absent in aluminum conductors. Contractors accustomed to the "give" in copper under excessive pulling stress will discover to their dismay that excessive over-stressing will rupture the aluminum conductor at a fraction of the stretch which copper can safely absorb.

The obvious solution is to pull aluminum cables without exceeding the recommended maximum stress, which is the same as that for copper cables. If this common limitation is observed, no additional pulling precautions need be taken, a fact confirmed by the majority of contractors with aluminum cable pulling experience.

35. *Aluminum Cable Joints—Non-technical Aspects*

The joining, splicing and connecting of aluminum cables is undoubtedly the most controversial and pivotal aspect of aluminum cable installations despite the fact that the problem of making swift, economical and reliable connections between aluminum cables and between aluminum and copper cables has been solved.

Since the purely technical difficulties have been solved, the only ones that remain are the human ones, and these are often far more formidable. The basic trouble is that aluminum cable connections are new and that they are different

[fol. 4868] from copper cable connections, which are entrenched with the familiarity of three-quarters of a century of electrical experience.

36. *Early Application*

Actually, aluminum cable connections are nearly as old as copper connections, but only on outside distribution lines. Long before ACSR cables became the virtual standard for transmission lines, all-aluminum cables were introduced and used successfully. The first known use of all-aluminum cable was in 1899,[20] and there are existing installations which date from shortly thereafter. Aluminum splices on these old lines and on the newer ones, through years of service, have proved their reliability, under electrical, corrosive and mechanical conditions which are generally far more extreme than any likely to be encountered in the usual office or industrial building. Consequently, it is, in reality, somewhat surprising that aluminum splices should be a significant deterrent to the increased use of insulated aluminum cables, or that it should seemingly be regarded by some contractors and engineers as a new and somewhat fearful problem.

37. *Factors in Attitude to Aluminum Cable Joints*

Some reasons for this situation can be pointed out. For one thing, many contractors who work on electrical building installations, never do transmission line work and consequently have been totally unacquainted with any kind of aluminum cable. This is especially true in large urban centers where the largest insulated cable installations occur. [fol. 4869] For another, while suitably engineered connections have been developed for aluminum transmission lines, such connections were until relatively recently not readily available for insulated aluminum building cables. As a matter of fact, the major development of insulated aluminum cable connectors has undoubtedly taken place in the past decade.

Finally, aluminum cable connections are in some respects different. They require some re-thinking by installers. They require, in general, different connectors and altered techniques. In short, aluminum cables cannot be joined as if

they were copper cables. They have different electrical, chemical and mechanical characteristics which require a properly designed connector and installing procedure.

38. *Good Electrical Connection—Requirements*

The basic definition of a good electrical connection is the same for aluminum and copper cables—a durable joint of 100 per cent or more conductivity.

The first requirement is an adequate area of good metal-to-metal contact. Many articles have been written pointing out that an aluminum cable joint requires a greater contact area than a copper cable joint. This requirement arises from the fact that an aluminum cable will have about 80 per cent of the current capacity of the same size copper cable, whereas its area conductivity is about 61 per cent of [fol. 4870] the copper cable. Consequently, to achieve the same relative conductivity an aluminum splice should have a contact area about one-third greater than the same size copper cable splice.

39. *Eliminating the Oxide Coating*

To achieve intimate contact of the joint members, the joint surfaces must be clean. In the case of aluminum the attainment of this condition is complicated by the tenaciousness and excellent insulation property of its oxide coating. This is the factor which introduces the major differences between aluminum cable and copper cable splices. Because the oxide coating reforms so rapidly, aluminum cable connections must be cleaned and made in the presence of an inhibiting grease or compound, whose principal function is to keep the oxygen of the air away from the newly uncoated metal surface and also to prevent gradual oxide reformation during the period of use.

Many suitable compounds are available. Some of the commoner ones are No-Ox-Id, Burndy Penetrox "A", ALCOA Joint Compound No. 2, or even ordinary vaseline. For all bolted and compression joints, it is advisable to first apply the compound and then thoroughly clean the cable ends with a soft wire brush through the compound, forcing it between the strands as much as possible.[2]

40. *Union of Aluminum Cable Strands at Joints Required*

An additional problem now arises. This results from the combined effect of aluminum's persistent oxide coating and [fol. 4871] the stranded construction of practically all electrical cables No. 8 A.W.G. size and larger. Within a stranded aluminum cable, each individual strand acts in effect like a separate insulated wire. This is fine as long as no splice occurs, since internal losses and skin effect are reduced. However, at a joint or splice, it is necessary to break down this insulating coating on all strands and unite them as closely as possible into a homogeneous conducting medium. Otherwise, the surface conductors will tend to carry most of the current, and both joint and cable will be operating at decreased efficiency, higher temperature and greater power loss.[2,21]

A good electrical connection of aluminum cables must attain as closely as possible complete electrical union of all strands. The three principal types of joints, welded, bolted and compression types, if properly designed, and installed, will provide the desired joint characteristics.

41. *Welded Connections*

Good welded joints provide the most efficient and reliable electrical connection. This is the only type of aluminum cable connection which does not require the use of compound, although the joint must be thoroughly cleaned. Generally this type of connection is confined to the joining of terminal connectors to cable ends. Helium-Arc electric welders are usually employed, the inert gas shielding the joint from oxidation so that a flux is not required. First the ends of the strands are welded together. Then the [fol. 4872] now solid end is welded to the body of the connector. Although the heat of the welding operation anneals a portion of the end of the cable, the reduction in strength is usually not important, particularly since the pulling operation has already occurred.

42. *Compression Connections*

Compression joints permit a wide variety of connectors ranging from cable end connectors to multi-branch splices. They are readily applicable to small as well as large cables. Connector bulk is relatively small and neat looking. The powerful equipment required is easily portable even for the largest size presses, which are capable of joining 2,000 MCM cables.[17]

This type of joint appears to break down interstrand resistance by a combination of crushing the strands and abrading-off their oxide coatings.[1] The use of compound prevents the oxide from reforming. The Burndy Engineering Company recommends the use of a zinc dust impregnated compound—their Penetrox "A"—with their compression joints. It is maintained that the zinc granules are forced between the strands and pierce the oxide to form conducting bridges.[22,17] The hollow bodies of the connectors are factory-filled with this compound and sealed, so that field application of the paste is not required.

The Thomas and Betts Company places reliance for obtaining a high conductivity joint completely on the crushing and abrading action of its compressive dies. These pro- [fol. 4873] duce one or more hexagonal compressions or cri-ps on the body of the connector with such force that the cable strands and connector are squeezed into an almost homogeneous solid union. The Burndy compression connectors use either an indent-type or circular crimp. All of these connectors are in successful use in many aluminum cable installations.

Aluminum cable compression connectors generally are made of cast or tube aluminum, with the tube-type connectors coming into wider use today. Tin-plated copper alloy connectors are also available and are used sucessfully on either copper or aluminum cables. Recently, the Thomas and Betts Company have come out with a tin-coated tube-type aluminum connector which is Underwriters' Laboratories' approved for both copper and aluminum cables. This type of aluminum cable lug is cheaper than the tin-plated copper alloy lug, retains the advantage of not requiring surface scratch-brushing through compound for its bolted terminal connection and is basically more suitable

for aluminum cables, because it eliminates the long-run contact problems arising from cyclic differential expansion of two different metal bodies in intimate contact.

Aluminum body compression connectors appear to be an excellent solution to most of the aluminum building cable joining and splicing requirements. They are quite economical, although a considerable initial outlay is required for a range of presses and dies. They are easy to apply. No annealed weaknening of the adjacent cable occurs, as in [fol. 4874] welding. They are quite versatile in their application, being available for cable-terminal lugs, butt splices for mixed cable sizes and mixed copper to aluminum joints, and for various combinations of take-off splices.

43. *Bolted Connectors*

Bolted connectors are capable of an even wider variety of applications than compression connectors and are available in a bewildering variety of sizes and designs. Although they are used successfully on all types of aluminum cables, it is undoubtedly more difficult to obtain excellent electrical connections with this type of connector than with the compression type. One of the reasons is the complexity of the connector, which usually consists of at least two main bodies, one or more spacers and a number of bolts, nuts and washers. Another reason is the greater dependence necessarily placed on the electrician to properly apply the compound, scratch-clean the conductors and, secure the connector to the cables without omitting a spacer or neglecting to tighten a bolt. Consequently, the efficiency of bolted connections will be more variable than compression connections.

The advantages of bolted connections are that they can readily be taken apart without destroying the joint and that they do not require a large initial capital outlay for welding machines or compression devices and dies. A disadvantage is their greater bulk and weight.

[fol. 4875] Effective scratch brushing is undoubtedly more important for a bolted connector, since low initial contact resistance cannot be achieved by powerful crushing and abrasion, as is the case with compression connections. Overall connection area will be larger to obtain the same effective

contact surface. Bolts should be tightened securely in order to crush the contacting surfaces as closely together as possible. It is not believed that the cold flow which will result from large applied pressures will be harmful, since surface contact will be maintained by the spring action of the bolts to a point where more or less stationary equilibrium will be reached between the forces in the bolts and the resisting stress in the aluminum cables. Certainly the cold flow tendency will be less than in compression connectors where it is not considered a problem.

44. *Cold Flow*

Cold flow is another overworked term which has frightened many a prospective user of aluminum conductors. Sometimes the term "creep" is employed, although creep generally means the non-elastic strain of materials at elevated temperatures caused by stresses below the proportional limit. Creep rates even for the lower melting metals, such as aluminum, are extremely small at the usual joint temperatures and stresses.[23] As previously pointed out, connections will not work loose even under stresses beyond the yield point which cause large plastic deformation, since the stress will decrease to a point of equilibrium without [fol. 4876] the cable pulling away from the connector. Furthermore, a good connector usually has fine grooves or ridges on its inner surfaces to bite into the connector and prevent joint slippage upon any relaxation of pressure. Actually, the plastic flow property of aluminum is helpful in obtaining close, firm electrical contact.

45. *Effect of Temperature Cycling*

The principal villain in the cases where the development of poor connections is ascribed to the plastic flow property of aluminum is usually a poorly designed connector, unsuitable for the environment in which it is applied. It will be found that the joint is unable to breathe properly under the cyclic temperature changes to which it is subjected. These temperature variations arise generally from the daily electrical load characteristic and are reinforced by the daily ambient temperature cycle.

The worst conditions will occur with an improperly de-

signed steel-bolted, copper-body connector under wide extremes of temperature cycling. As the temperature goes up, the copper tends to press harder against the aluminum cable, since aluminum has a temperature-expansion coefficient about 36 per cent greater than copper. The stress within the aluminum copper and steel increases. Relative movement occurs which depends on the relative expansion coefficients, the elastic moduli and the strength of the steel bolts. Finally, at a high enough temperature, the stress in the aluminum will exceed its yield point and it will tend to [fol. 4877] extrude out of the joint. Upon subsequent cooling to the original temperature, the deformed joint will exhibit decreased contact pressure and higher resistance. This chain of events will cause progressively increasing joint temperatures and resistance in succeeding cycles until complete joint failure occurs.

46. *Combatting Heat Cycling Joint Deterioration*

However, copper body connectors have been and are used with no trouble if properly designed and properly installed in environments which do not exceed their inherent abilities. This has been strikingly demonstrated previously in this section in the discussion of branch circuit wiring connections. A particular connector may be perfectly good on a normally loaded feeder within the relatively mild temperatures encountered in a modern structure and it may fail disastrously and quickly if used on extra heavy duty, wide-temperature cycle applications, such as underground feeder networks. The designer and installer must apply common sense to a sound knowledge of joint characteristics. And this is true for copper as well as aluminum joints.

There are various ways to combat heat cycling deterioration of joints. One way is to use larger connector bodies and decreased contact pressures. A better way is to design the connector so that all parts will "breathe" under stress and strain variations. It is important that the steel bolts should not be too large or they will not have enough spring action or "give" to permit elastic expansion of the alumi- [fol. 4878] num and copper. The use of copper alloy bolts which have a larger spring constant (modulus of elasticity)

than steel and a larger temperature expansion coefficient will be a further help.

However, the best solution is the use of all-aluminum connectors, including aluminum bolts, for aluminum cable connections and also for aluminum-to-copper cable connections.[2,25] Good results have been attained with aluminum connectors using galvanized steel bolts.[22] The tendency nowadays, however, is to use the all-aluminum connector. Aluminum alloy bolts have strengths in the range of mild steel. The nuisance of thread seizing, a previous complaint, has been eliminated by hard-surfacing the threads with an Alumilite (heavy oxide) finish and dipping them in an antifriction compound such as No-Ox-Id.

47. *Galvanic Corrosion*

The use of all-aluminum bolted connectors not only effectively lays to rest the bogey of differential cyclic expansion, but also largely eliminates the danger of galvanic deterioration of the joint, even when copper and aluminum cables are joined. Galvanic or electrolytic corrosion of aluminum installations is another one of the fearful apprehensions which seem to haunt engineers and contractors with an intensity entirely disproportionate to the reality of the situation.

First of all, in the great majority of building installations galvanic corrosion, as well as chemical corrosion, will not even exist, since the necessary ingredient for galvanic cor- [fol. 4879] rosion, the simultaneous existence of moisture and electrolyte, will not be present in the joint environment. Secondly, if galvanic corrosion or the possibility of galvanic corrosion does occur, it can be easily and effectively combatted.

Galvanic corrosion occurs when metals of different electro-chemical potential form an electrolytic cell as part of a closed circuit. Under such conditions, the more anodic metal will deteriorate, its molecules being drawn into solution and then deposited as insoluble material in the joint and its vicinity. The farther apart in the electromotive series, the two metals are, the more intense will be the galvanic activity. Since copper and aluminum have over two

volts of d.c. potential between them, these two metals can easily form destructive electrolytic cells under the proper conditions. Since aluminum is anodic or less noble with respect to copper, aluminum will be the metal which undergoes progressive destruction of its material.

48. *Preventing Galvanic Corrosion*

There are various ways to prevent galvanic corrosion of aluminum-copper joints or to minimize it in the presence of conditions (i.e. moisture and electrolyte) more or less permissive to it.[26,27] These include the following:

(a) Sealing or painting the joint with an inert material. Both materials should be coated. If not, then the cathodic rather than the anodic material. Coating the anodic material only is, in fact, dangerous, since a tiny flaw will immediately lead to accelerated galvanic activity at the [fol. 4880] exposed anode material, which will be all the more intense the smaller the fault.

(b) Plating of one of the joint materials or both with a metal midway in the electromotive series between the joined metals. The plating will act as a buffer and reduce the electrolytic cell voltage and therefore the galvanic deterioration of the anode.

(c) Isolation of the reacting metal surfaces, usually by rubber taping the joint, thereby lengthening the liquid electrolytic path and increasing its resistance.

(d) The use of relatively large anodic areas as compared to the cathode material. Galvanic current density at the anode may in this way be decreased greatly, with the result that corrosive deterioration will be reduced to a negligible hazard. Thus, it is not desirable to tap off small aluminum wires from large copper conductors, because the high current density at the relatively small anode (if electrolysis occurs) will rapidly destroy the joint.

(e) In an aluminum-copper cable joint, the aluminum conductor should always be placed above the copper conductor, if possible. This will tend to keep copper salts from draining on to the aluminum conductor and will thus reduce the effect of electrolytic corrosion on the aluminum conductor.

Today there is less of a tendency to be frightened by galvanic corrosion of aluminum, since more is known about it and more effective means of combatting it are available. [fol. 4881] The emphasis has shifted from the negative and sometimes irrelevant aspect of merely preventing galvanic corrosion to the positive and more fruitful attitude of maintaining proper joint conductivity, despite the presence or possibility of galvanic corrosion.

This philosophy has resulted in the recent development and introduction of all-aluminum bolted connectors of relatively massive proportions for aluminum-to-copper, as well as aluminum-to-aluminum joints. Reduction of electrolytic deterioration to a negligible proportion is accomplished in three ways, (1) by maintaining relatively wide separation between the copper and aluminum cables, (2) by presenting a relatively large anode surface, thereby greatly reducing electrolytic current density at the anode, (3) by the large aluminum connector, acting as a sacrificial material in lieu of the aluminum conductor.

49. *Certain Disadvantages of Aluminum Cables*

It has already been pointed out that the use of aluminum building wire and cable must overcome certain handicaps, such as generally increased conduit sizes for an appreciable range of loads and different joining methods which require somewhat more care and effort than all-copper splices. These have been discussed and to some extent evaluated. In addition, there are some other considerations which should be recognized by the designer and contractor in order to eliminate or minimize the disadvantages resulting therefrom.

[fol. 4882] 50. *Educating Electricians*

One of these is the fact that relatively few electrical journeymen are acquainted with aluminum cable handling and splicing. In most cases, it will probably be advantageous and economical to brief the workmen beforehand on proper methods. Experience has shown that the installation and splicing techniques for aluminum conductors are readily acquired and successfully applied. Practically all

contractors consider present splicing techniques for aluminum conductors entirely adequate. (See Section No. 12 for additional discussion of this subject.)

51. *Additional Wiring Space Requirements*

Another difficulty that arises is that most electrical devices such as switches and starters are usually supplied with terminals suitable for copper cables. In many cases, the aluminum cable is too big and will require an adapter to fit the equipment lugs. Or the original lugs will have to be replaced by lugs suitable for aluminum cables, if this is possible. Since aluminum cables are usually one or two sizes larger, wiring space adequate for copper cables may become too crowded, thereby hindering the making of satisfactory connections.[22]

It is therefore essential that the engineer and contractor keep these considerations in mind when preparing specifications or ordering equipment. Many equipments can be supplied with connectors or lugs suitable for aluminum cables and with increased wiring space at little or no additional cost, if specified beforehand.

[fol. 4883] 52. *Examples of Insulated Aluminum Cable Installations*

Actual installation of insulated aluminum cables in commercial and industrial establishments are relatively few, except for those owned by the various aluminum producing and fabricating companies. Among these, particularly notable recent installations are: (1) the ALCOA Building in Pittsburgh, [28,29] a sky-scraper-type office building, (2) the huge Davenport, Iowa, rolling mill of the Aluminum Company of America,[30] (3) the vast Kitimat electrical power and aluminum producing complex of the Aluminum Company of Canada,[19] and (4) the heavy forge plant of the Aluminum Company of America in Cleveland.[33] These structures use aluminum branch circuit wires as well as aluminum cable feeders.

53. *Forge Plant Aluminum Cable Installation*

The forge plant installation was built in 1953. The choice of aluminum wires and cables was made on the basis of comparative bids in which quotations were received for both copper and aluminum cable conductors. The quotation for the entire job using aluminum conductors [32] was about 4 per cent lower than with copper conductors. It should be noted that since most of the heavy, low-voltage feeders were run as open wiring in lightweight aluminum utility baskets, the inherent price advantage of aluminum cables was not penalized by larger conduit requirements. Also that the percentage differential for those items involving direct comparisons between aluminum and copper conductors would have been much higher than the 4 per cent for the entire job.

[fol. 4884] 54. *Aluminum Cable Installation in San Francisco*

Successful and economical installations have also been achieved by establishments other than the aluminum companies. A particularly interesting example is the distribution system of the 22-story Standard Oil Company office building in San Francisco. This system consists of aluminum cable risers in asbestos-cement ducts and was installed in 1949.

Aluminum cables were chosen after a comprehensive economic study involving copper and aluminum low-reactance bus, tubular bus, and copper cable, as well as aluminum cable-risers. The results of this study were published in 1952 and later, 1956,[31] were recalculated to conform with 1955 material and labor prices.

A comparison of all system costs, including main switchgear, external switching equipment, bus vault connections, conduits and total labor cost, as well as conductor costs, indicated that a copper cable installation would involve a total of 5.2 per cent more in 1949 and 7.2 per cent more in 1955. Of particular pertinence is the fact that all savings were in the conductor and labor costs. Using copper cables in 1955 would have required 34 per cent more for cable material costs and 4 per cent more in total labor costs.

It should be noted that the cable installation labor costs alone would reflect a much greater difference than 4 per cent.

[fol. 4885] 55. *Aluminum Cable Installation on Long Island*

Another interesting aluminum cable installation, this one in steel conduit, was installed during the Korean War period in a large Long Island Department Store.[33] Although the system had originally been designed for copper cables, the shortage of copper forced the substitution of aluminum.

It was found possible to switch to aluminum cable of nearly equivalent capacity despite the fact that the conduits originally specified for copper cables had already been installed. Moreover, since some copper cable was on hand, some feeders were installed with aluminum phase wires and copper neutral and others with copper phase wires and aluminum neutrals. Connectors and terminal lugs are bolted types and made of plated cast copper alloy.

A recent inquiry revealed that after five years service, this installation continues to give satisfactory performance. No serious defects or problems have been encountered by the maintenance engineers, who regard the installation with considerable satisfaction and a certain pride in its uniqueness in their area.

56. *Previous and Recent Use of Aluminum Cables*

There are, of course, scores of other successful aluminum cable installations all over the United States and also in other parts of the world. The use of all-aluminum cable can be traced as far back as 1899,[16] of ACSR cable to 1909 [16] and of insulated aluminum conductors to 1927.[33] [fol. 4886] However, the substantial use of insulated aluminum cables received its great spur during the copper shortage occasioned by World War II.

In 1947 a very considerable amount of insulated aluminum cable was shipped to hundred of installations all over the country, with one cable company alone supplying over half a million feet to seventy industrial plants and facilities.[34]

However, the vast majority of all building wire and cable installation has been and still remains copper. National (U.S.) Comparative Statistical information for the years 1955 and 1956 has been collected by the National Electrical Manufacturers' Association (NEMA), but is generally unavailable for previous years.

Table 9

Building Wire Sales

	Copper		Aluminum	
Year	Millions of Dollars	per cent	Millions of Dollars	Per Cent
1955.....	113.9	99.5	0.58	0.51
1956.....	156.6	99.1	1.35	0.86

There is reason to believe that in previous years, notably 1947 and 1952 the percentage of aluminum wire was higher. One major cable company indicated that aluminum building wire and cable constituted 2 per cent of its gross sales in 1952 (during the temporary Korean War copper shortage) although only about 0.3 per cent in 1956.

[fol. 4887] The fact that in the past two years of relative normal supply, aluminum building wire and cable sales constituted less than one per cent of total building wire and cable sales should prove a powerful spur to aluminum cable sales organizations, since the potential area of economic application and use of aluminum building wire and cable is certainly far greater than this percentage.

57. *Summary and Conclusions*

The use of insulated aluminum wires and cables is now entirely practicable with the development of flexible, partially annealed conductors and satisfactory splicing and joining techniques. The major present problem in this area involves the education of engineers and contractors to this realization.

Considerable economies can be realized by the use of aluminum building wires and cables in view of existing price differentials between aluminum and copper insulated conductors. These economies are more apparent for rack or fibre-duct installations where the economy of the aluminum cables is not penalized by the need for larger metallic conduits. Considerable savings can also be realized in cable

and conduit installations for loads above 200 amperes. There appears to be good reason for appreciable savings in the use of aluminum branch circuit wiring in 480/277-volt systems.

Although there are many successful and economical installations of aluminum building wires and cables through-[fol. 4888] out the United States, the relatively small amount of aluminum building wire and cable sales as compared to copper, indicates that many economical applications are being overlooked or neglected. This represents a considerable challenge to design and sales engineers.

[fol. 4894]

ROCHESTER, N. Y.

January 16, 1957

[fol. 4895]

On behalf of Rome Cable Corporation I wish to express our appreciation for your kind invitation to tell you something about our Company and the great electrical manufacturing industry of which we are a part.

I would like to divide this talk into four sections, one, some general background facts about our Company and the industry of which we are a part, second, financial facts, third, our organization and what it works with and something of what we are doing and fourth, some current estimates and a glance at the future.

Now, as to our Company, we were incorporated as a New York State corporation on January 20, 1936, which is just twenty-one years ago next Sunday. So, you see having come through infancy, youth, adolescence as we enter 1957 we are just coming of age. Those of you who can remember 1936 will have some memories that the country was in the midst of its worst depression and the idea of raising one and three-quarter million dollars to start a new company in an industry operating at 35 per cent of capacity did not have the investment appeal of brewery and distillery stocks, following in the wake of repeal of probihition. We were among the first industrial companies to file a Registration Statement and Prospectus with the Securities & Exchange Commission. One week after the offering we had sufficient assurance to proceed on a small scale and had subscriptions for our entire million and three-quarter dollars by June and shipped our first product in mid July 1936.

We are a part of the electrical manufacturing industry which last year had an estimated gross output of nineteen and a half billion dollars. The wire industry with almost two hundred manufacturers does about 10 per cent of the electrical manufacturing industry total. Our industry consumes about half of the new copper consumed in the United States. Less than 15 percent of the total manufacturers produce the greatest percentage of the overall total. There are a large number of small

specialty manufacturers. Anaconda, Kennecott, Phelps-Dodge, American Smelting & Refining and more recently Consolidated Copper and Cerro de Pasco operate wholly owned or controlled subsidiaries. United States Steel Company and Colorado Fuel & Iron have electrical conductor operating subsidiaries. With the increasing use of aluminum as an electrical conductor ALCOA, Kaiser and Reynolds have been expanding their interests. Kaiser Aluminum just last week acquired the wire and cable facilities of the United States Rubber Company.

When we started in business in 1936, we were the only independent company to have its own copper rolling mill. Now there are three or four others. We were one of the earliest copper producing companies to also install our own aluminum casting and rolling mill. Our rolling mill and bare wire fabricating units process sizeable quantities for General Electric, Westinghouse and other wire fabricators. We have one wire and cable plant in Rome, N.Y., and a steel conduit plant in Torrance, California which we acquired in 1950. This is the only conduit plant in operation today west of St. Louis.

We started with a limited line of standard products of rods, bare and weatherproof wire which has now expanded to cotton, paper, asbestos and glass magnet wire, rubber and plastic construction wires, flexible cords, mining cords and cables, signal wires, control cables, rigid and thin wall steel conduit, high and low voltage overhead and underground cables, and many specialties for various industries and the Government. It is important to note that in times of emergency the same machines that produce civilian items can and have produced sizeable quantities for the military. We make tens of thousands of sizes and varieties from sizes smaller than the human hair to cables larger than your wrist. We sell approximately a quarter of our product to each of the following three groups, utilities and electrical manufacturing industry, other fabricators and electrical wholesalers, while about seven per cent goes to local, state and national governments of which a

[fol. 4897]

sizeable portion is for utilities and the balance of about fourteen per cent goes to industrial, chemical, oil, mining, railroad and a miscellany of other channels.

We sell through our own salesmen and some agents. We have eighteen offices, nine warehouses and almost three hundred other stocks strategically located throughout the United States.

So much for a brief rundown on general items. Let us now look at some items on the balance sheet. Even in this period of tight money our receivables are turning over in excess of twelve times per year. We have sold in excess of half a billion dollars of products since our start and our bad debt loss has been only $61,000, which gives high commendation both for the type of customers we have been dealing with, as well as our Treasurer's ability to get payment for what we ship.

From the start our cost of inventory has been taken on the well known and conservative LIFO principle. With copper selling at 36 cents in January our inventory cost approximates the 12 cent level. Chart No. 1 shows the average price of copper by years since 1937 to date and the price in Rome Cable inventory. Market price of our inventory today is over three and a half million dollars in excess of book value.

Net fixed assets of approximately eight million dollars for almost a million square feet of floor space and equipment have an appraised gross replacement value almost three times that figure.

By the end of our fiscal year, March 31, 1957, we will have an outstanding long term debt of $3,049,000 at the favorable interest rate of 3.9 per cent. Further payments of $460,000 will be made next year. As of March 31 this should be our only borrowing, and we have no present plans involving major financing for the new year.

With the addition of the shares issued on the 5 per cent stock dividend on January 4th we have 556,000 shares outstanding and 35,794 shares additional in treasury stock. We have almost 1900

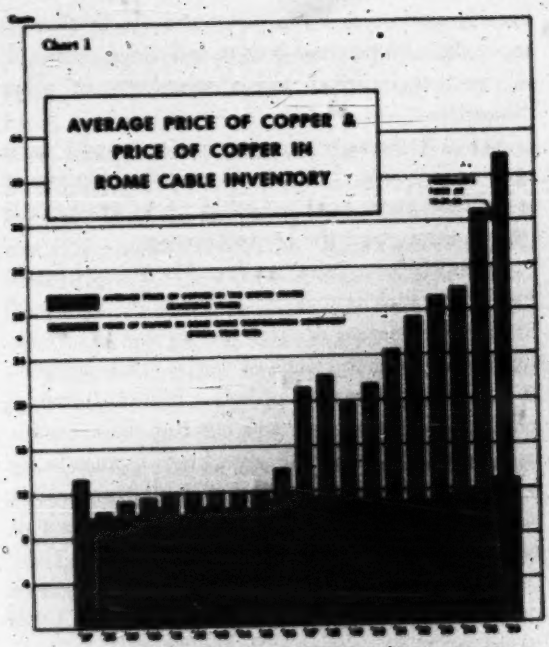

Chart 1
AVERAGE PRICE OF COPPER &
PRICE OF COPPER IN
ROME CABLE INVENTORY

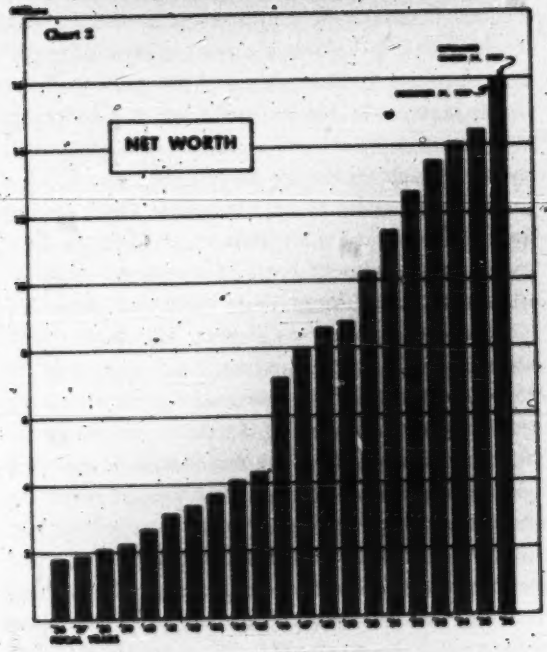

Chart 2
NET WORTH

[fol. 4899]

share owners and about one-third of outstanding stock is owned by employees and their families.

Chart No. 2 shows the growth of net worth since the start of the Company. At the time of the last quarterly report, at the end of September, it totalled $15,300,000.

There is one item I would like to comment on and that is our investment in the American Synthetic Rubber Corporation, wherein five other wire and cable companies and a group of other mechanical rubber goods manufacturers formed a new company to purchase the assets of the Louisville plant of the Reconstruction Finance Corporation making GR-S Type Synthetic Rubber. This is an investment which gives us a call on a portion of their production and insures us an adequate supply as well as keeping us abreast of most up-to-date research activities in the production of this type of synthetic rubber.

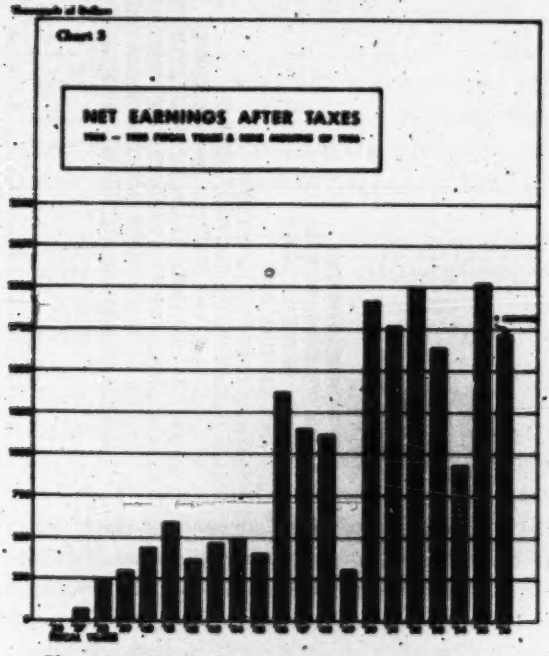

Chart No. 3 shows net earnings after taxes since the start of the Company. Total earnings to date

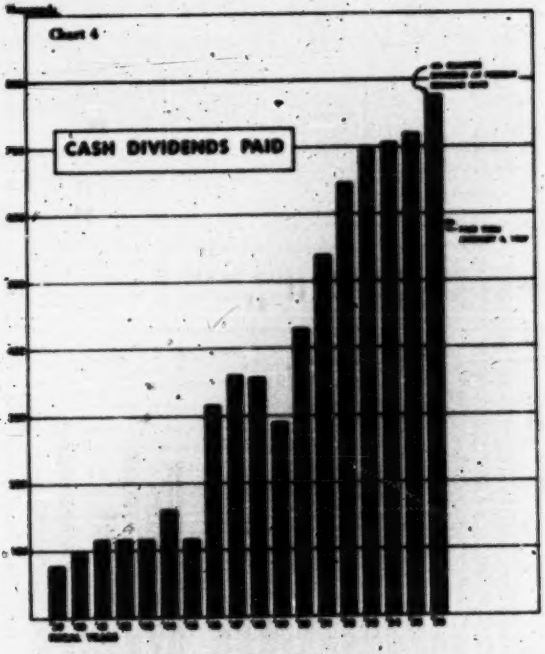
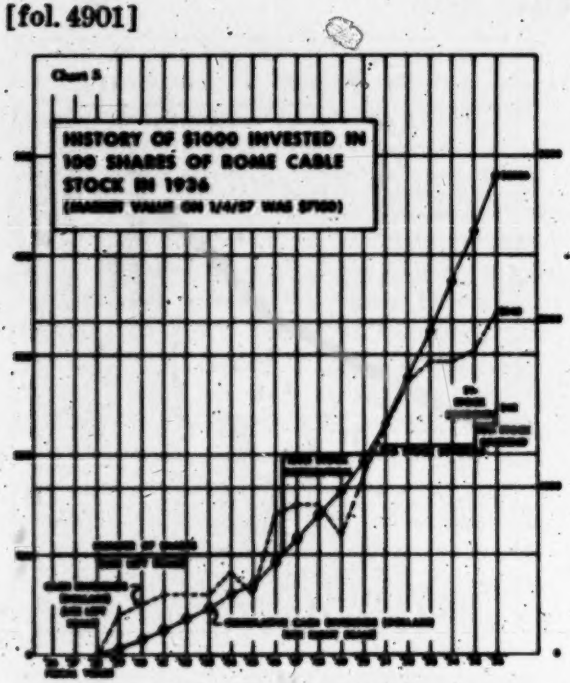
exceed nineteen million dollars which are after the heavy impact of taxes charged against a growth company. Our total direct tax bill since the start has represented almost 7 cents on the sales dollar, and when we add in withholding taxes paid for employees we come to a figure of over $45,000,000 compared to the $19,000,000 left as retained earnings.

Chart No. 4 shows cash dividends paid since the start, a total of over $6,400,000. In addition we had a 100 per cent stock distribution in 1947, a 5 per cent stock dividend in 1951, a 10 per cent stock dividend in February 1956 and another 5 per cent stock dividend in January of 1957.



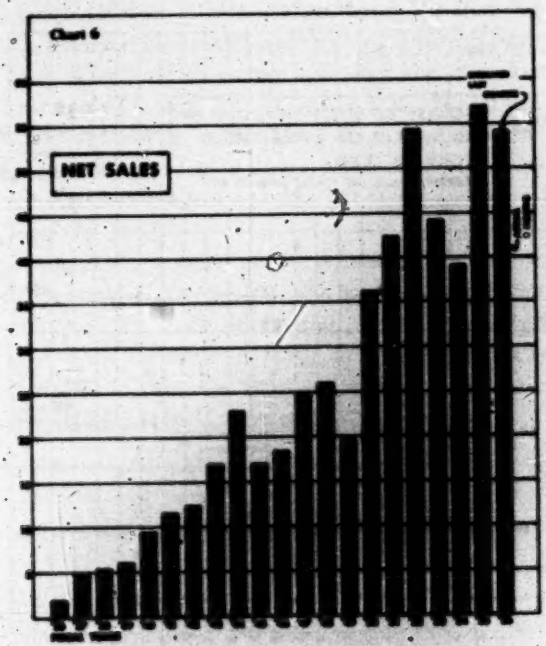
I particularly call your attention to Chart No. 5 which gives the history of the investment of $1,000 in 100 shares of Rome Cable Common Stock in 1936 when the Company was formed. If you will look at the chart you will notice that with the above stock distribution and stock dividends the share

[fol. 4901]



owner would now hold 242 shares of stock with a market value of approximately $7,100. He would have received $2,886 in accumulative cash dividends to date, and his dividend income in fiscal year 1956 would total $343.

The next Chart No. 6 shows the sales growth. In our first year, 1936, we had sales of $1,800,000 and that climbed to almost $57,000,000 last year. In the current fiscal year the total will be slightly less. We have been called a "war baby." I would therefore like to say for the record that our direct Government business in the current fiscal year is approximately 1 per cent. Both in World War II and the Korean episode our Company made significant contributions in specialized products, which added considerably to the sales volume in those periods. We were the main contractor to manufacture aircraft ignition leads in World War II and we held the largest contract to manufacture a special communication cable for the Signal Corps in the



Korean War. In both instances we made voluntary refunds to the Government of several millions of dollars.

Now let us come to the third part of this talk, namely, organization, what it works with and what we are doing. We have over fifteen hundred employees, only a small percentage of whom are unionized. We have a Board of Directors of twelve, eight of whom are working officers, comprising the executive committee. This provides flexibility and promptness of action. While organization does not appear as an item on the balance sheet we believe that as H. T. Dyett, Chairman of the Board and founder of the Company, said at the time of starting the Company "Organization is much more important than bricks and mortar."

While the Company is only twenty-one years old most of the major executives have had many more years of active experience in the wire and cable industry. Each year we have added a number of College graduates for a student training course.

Some of the early graduates of that course now hold leading positions in the Company. We have never had a work stoppage due to labor grievances.

I believe each of you have a copy of our last Annual Report, which shows that 67½ cents of our sales dollar goes for materials we use. This covers copper, aluminum, steel, rubber, plastics, cotton, paper, glass, lead, tin, zinc, chemicals and a whole host of other components. We consider our relations with our suppliers as one of our most important responsibilities. Diversity of supply, particularly in the major items, has saved us from the crippling shutdowns that have affected some in our industry.

Industry strikes throughout the world in 1955 which cut out approximately one month's production, plus the then booming European economy, ran the world price of copper in March of 1956 to approximately 55 cents per pound. Production caught up with and exceeded demand by mid-year, and the January producer price is 36 cents with some available in the world markets down as low as 34 cents. Aluminum which started the year in tight supply is now plentiful. Our suppliers and commitments for steel should take care of us adequately. So, as of this moment, we have no raw material supply problems.

Ours is a very competitive industry, so that in addition to expanding our facilities to take care of increased demand we are ever on the alert to provide the most modern equipment to get the best quality at the lowest cost. By the end of the current fiscal year we will have spent a yearly average of $1,100,000 since the end of World War II for capital equipment. Our depreciation in the same twelve year period has been running at the rate of half a million dollars per year average; so you can tell from those figures that, in addition to funds from our long-term loan, a sizeable portion of retained earnings has been plowed back for this purpose. In the current fiscal year our total expenditures will approximate our present depreciation rate of about $800,000. In the last two fiscal years

[fol. 4904]

earnings have been charged with approximately a total of $300,000 as plant rearrangement costs for more efficient production with an expected annual savings therefrom in excess of half a million dollars gross per year.

In 1956 and 1957 we will have doubled our capacity for production of aluminum rod, have added to our insulating, extruding, cabling and drawing equipment. We will also have facilities for enameling rectangular magnet wire, besides adding capacity in many other lines, particularly in the rapidly growing and less competitive high voltage field.

We are a Company that believes in incentives. Practically all of our direct labor operations have been on piece work, or bonus systems for many years. Starting January 2nd all of our indirect workers at the Rome plant are included under a new incentive production plan. With the issuance of the original prospectus we included a management bonus plan which enabled us to start with moderate salaries with improved compensation as earnings warranted it. The same holds true for other key employees who are covered by a supervisory bonus. Furthermore, since the start of payment of the first dividend to share owners all employees, other than those included in the executive bonus plan, have been covered by what we have called an Employee Dividend-Sharing Plan, which has been adopted by several other companies in United States and elsewhere. Almost two and a half million dollars have been distributed under this Plan since the start.

Recognizing the difficulties of providing adequate compensation under present tax laws and the added incentive of key employee stock ownership, our share owners approved in 1950 offering shares to employees on a ten year purchase plan. Ninety-seven employees have shared in the distribution of 46,175 shares under this authorization. At last June's meeting share owners further authorized 36,000 shares on a Stock Option Plan. We have

up-to-date pension and profit-sharing plans, provide sick and accident, medical and hospitalization coverage, as well as a Company and Employee contributed Group Life Plan with an average coverage of over $6,000.

Like Eastman Kodak, who were most helpful in getting our own plan started, we have a full-time Medical Director, with nursing staff, laboratory technicians and equipment, so that all employees get an annual physical examination. I could spend considerable time extolling the virtues of this program alone.

We are also great believers in the matter of keeping our employees up-to-date on happenings in the Company or the national scene which affect their livelihood, and have carried on plant-wide courses to all employees to better acquaint our people with the workings of our private enterprise system and how our Company fits in as a part. We likewise believe in upgrading or promoting from within the organization and have a full-time educational director working with our student course, interviewing graduates, checking candidates for Foundation scholarships and eventually arranging other educational in-plant work.

Our people are active in the life of the community, and our executives are serving in important industry, state and national organizations. We aggressively pursue improvement of relations with share owners, customers, suppliers, employees and the public.

In 1952 the Aluminum Company of America decided to enter the insulated aluminum conductor field and entered into an agreement with us to insulate bare conductor, which they furnished us, with rubber and plastic covering for their selling. This has been a very satisfactory arrangement for both companies. We gained increased production output and experience. In the latter months of 1956 they have installed their own plastic covering equipment at Massena.

[fol. 4906]

Our changing economy with its heavy taxation burden has shifted an increasingly large responsibility on industry for contributions to educational, religious and a wide variety of charitable institutions. Rome Cable Foundation was started by the Company in 1952 as a means of better carrying out our part. Annual contributions have been made by the Company to the Foundation. Forty-seven scholarships have been granted to sons and daughters of the community, of which about half have been to relatives of employees. The Foundation now has assets totalling over one-quarter million dollars and is earning 4.5 per cent on its investments.

In our rapidly moving age of change and progress I wonder how many of you realize the many major items in our daily life that we accept which we did not have in 1936 when our Company was started. There was no FM radio, no TV, no jet airplanes, no 300 horsepower automobile engines, no guided missiles, no atom bomb, no H-bomb, nylon was a rarity and there was very little diesel transportation. The use of gas and oil for heating wasn't general. There were very few deep freezers. The heat pump was unheard of, the outdoor movies, and the three-D dimensional movies or cameras were not common. Hosts of new electrical appliances have come into being.

Likewise in our industry we started out with copper as our only conductor, and natural rubber as our main insulation. We now have man-made rubber of several varieties, Neoprene, GRS, Butyl, the Isocyanates, a great variety of plastics of which Poly-vinyl chloride and Polyethylene are most used, but there are many more. I had one of the executives of a chemical company tell me the other day that they were furnishing industry with twenty-two different kinds of plastics, and they had nineteen more they were working on in the laboratory. Glass fibers have become an important use item with us. In the last five years aluminum has become an important base conductor for insulated wire. In 1952 it only represented 5 per cent of our total volume in

[fol. 4907]

copper equivalent whereas in this last year it has climbed to almost 25 per cent of our total.

I have told you all this as background because it emphasizes the importance of research. I have seen some figures that state that industrial research only totalled approximately one quarter billion dollars in 1940 and is now running at the rate of seven billion dollars annually. The electrical manufacturing and machinery industry is currently spending 30 per cent of the total research and development expenditures of the country. While our research and development budget is not equal percentagewise to some of the large units in the electrical manufacturing industry, we believe our budget proportion equals or exceeds other leaders in our industry. Fruits of that excellent work of the Research and allied departments can be gained from the fact that 39 per cent of the products which we sold this year we were not making at the end of World War II. Because it has been proven that dollars invested in research, return many times in volume and earnings, and with the many new challenges presented to us by suppliers and customers our program for research is being expanded in the next and succeeding years. I have a number of samples on the table here that you can look at, if you desire to do so after the meeting. I want to speak particularly about one, however, a Polyethylene Insulated Power Cable, which is the product of our Research and Engineering, a 34.5 KV Cable which I believe is the highest voltage polyethylene cable in actual use in an industrial company in this country.

As Investment Analysts I presume you are particularly interested in earnings for the current and future periods. I hope that my predictions will be better than the Michigan editor who seventy years ago writing under a gas lamp said "electricity is developed by waste and disturbance of atoms which is expensive. The great mass of people will never use this costly illumination to banish darkness from their humble dwellings." For the period ending December 31, 1956, which is the third quarter of

our fiscal year, we estimate our earnings to be about the same as the corresponding period of a year ago, but down approximately 15 per cent from the previous quarter in this year. This is due mainly to drop in sales volume and change in product distribution, caused in some part by heavy inventory liquidations by some of our customers owing to high prices of copper. Although fourth quarter sales are estimated at lower than those for the one just ended, overall earnings for the year should better last year's record.

Now as to the new fiscal year, which we will start in April, we like to use the newspaper headline used in connection with Secretary of Commerce Weeks' yearend statement, which said that the Outlook for 1957 was bright but prosperity was not automatic. Specifically we do not believe we will be troubled with raw material supplies. A rising number of companies have made settlements of labor contracts for three years; so we should have a longer period of labor peace.

Our industry serves utilities, electrical manufacturing, construction, mining, oil, chemical, automobile, airplane, communications, railroads, as well as Government. Almost without exception the difference in predictions for 1957 by the various economists is one of the amount of increase. Preliminary survey of utility expenditures and budget made by McGraw-Hill estimate increases as high as 20 per cent in the new year. Estimates for new plant and equipment are up as high as 11 per cent. New housing starts may be down but the size of homes is increasing due to population and income increases. Coupling this with commercial, industrial and public construction plans, overall construction should be higher. Coal mining industry is definitely on the upgrade. Recent world events are going to add 10 per cent to Government defense spending, and the Middle East situation will require further increases in the oil industry. The automobile and airplane industries are scheduling higher production levels. Railroad equip-

[fol. 4909]

ment backlogs are heavy. The chemical industry as a service industry and supplier of all industries will also be up. The need for rewiring of most homes over five years old to provide increased power for the many new electrical appliances necessary to modern living provides an increasing market. The slogan of the campaign launched last year "Live Better Electrically" is catching on apace. Gross national product and consumers spending are estimated to be up 4 to 5 per cent.

On the other hand, there are other factors which must be recognized as progress deterrents. Inflation continues with the annual hypodermic of wage increases. Price increases are generally not sufficient to offset these rising costs, and even increased productivity from better mechanization and labor efficiency has not kept pace with these added costs. Foreign competition is increasing in many industries.

You have seen indications of deferment of some capital expenditures due to the tight money market. The growing need for municipal and state services for schools, hospitals, roads and public buildings which has mushroomed their taxation programs is going to be a further significant drain on corporation profits. Excessive taxation deprives companies and higher income individuals of "seed money."

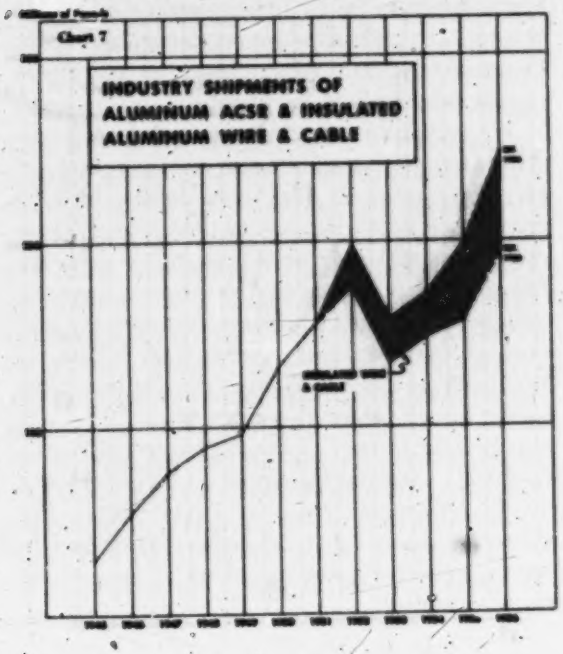
We need a more realistic approach to depreciation by recognizing replacement costs as a means of providing money to finance the future. In 1955 depreciation of all industry totalled fifteen billion dollars, and with the retained earnings of about ten billion above dividends this was close to financing the total of plant and equipment corporate expenditures of twenty-seven to twenty-eight billion. In 1956 with a thirty-five to thirty-eight billion dollar budget there is a much wider gap. With 1957 scheduled between forty and forty-five billion emphasizes need for a more realtistic approach by Government on the subject of "stay even" depreciation. The above factors will put additional strains on the profit picture and mean narrowing of margins for many industries.

[fol. 4910]

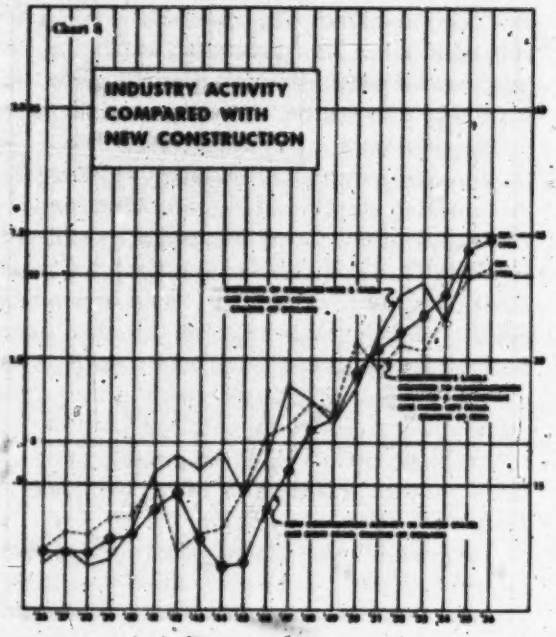
In our own industry we expect that some of the adverse factors of inventory liquidation may reduce volume in the early part of the year, but we look for volume in this year as a whole to be better than in 1956.

Now we come to the "Great Beyond" or the period following 1957 on a long range basis. Chart No. 7 shows the tremendous growth in the use of aluminum as an electrical conductor. Note the rapidity of growth of the insulated product in the last few years. Chart No. 8 shows that parelleling of insulated wire and cable shipments and construction wire labels purchased compared to the construction activity index, which would indicate that as that progresses so should sales volume on insulated wires and cables.

Chart No. 9 is a most interesting one. We used it as far as capital expenditures and production of Kilowatt hours were concerned in our original prospectus in 1936. We have now plotted our sales volume and note how it has kept pace with the kilo-



[fol. 4911]



INDUSTRY ACTIVITY
COMPARED WITH
NEW CONSTRUCTION

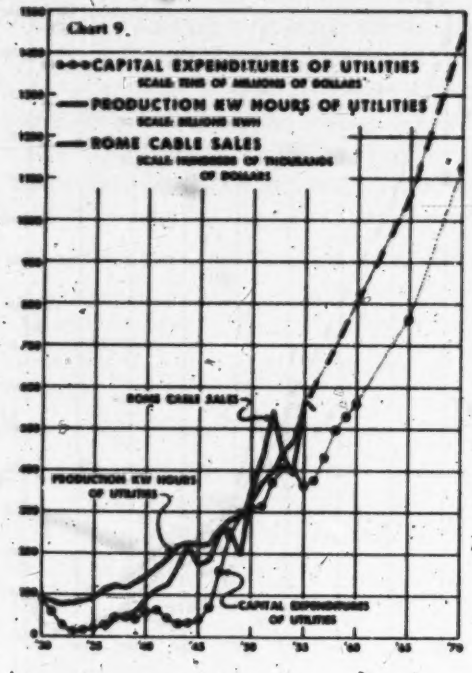


Chart 9.
CAPITAL EXPENDITURES OF UTILITIES
PRODUCTION KW HOURS OF UTILITIES
ROME CABLE SALES
ROME CABLE SALES
PRODUCTION KW HOURS OF UTILITIES
CAPITAL EXPENDITURES OF UTILITIES

watt hour production. The projections of McGraw-Hill on Kilowatt hour production and capital expenditures of utilities are shown on the graph and if we kept pace you could easily project our sales.

The electrical manufacturing industry was a six billion dollar industry in 1936 when we started. In his remarks to the National Electrical Manufacturers Association at its annual convention in Atlantic City last Fall, Ralph Cordiner, President of General Electric Company, predicted it would be a ninety billion dollar industry by 1976 and that Gross National Product would double what it was in 1956, and that kilowatt hour output would be four times greater than the six hundred billion of 1956. He further stated that the electrical manufacturing industry has been growing from two to three times as fast as the economy as a whole.

You are well aware of the forecast on population increases, so that even maintenance of present living standards is going to tax our productive machinery. If the wire and cable industry were to maintain its proportion of the total electrical manufacturing industry, it would mean volume of four times the present levels by 1976.

In conclusion I can only say that our organization is alert to the opportunities which lie ahead and by continued effective teamwork will accept and meet whatever challenge the future holds for us.

[fol. 4913] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 53

Minutes of Meeting of Executive Committee of Rome Cable Corporation, November 6, 1950

A meeting of the Executive Committee of Rome Cable Corporation was held on Monday, November 6, 1950, at 11:00 A.M.

There were present: Messrs. Barnard, Collins, H. T. Dyett, Ellis, Fraser, Rolston and J. H. Dyett.

The Secretary read the minutes of the meeting of October 27, 1950 which minutes were unanimously approved as read.

Mr. Fraser reported on Mr. Andersen's visit to Rome on November 3rd. He pointed out that with increases over estimates the total building and equipment program at Torrance now totalled $1,236,000. At the meeting with Arthur Andersen an additional amount of $24,000 was approved for the wiping and cooling equipment and $100,000 for a second heavy tube mill. In respect to the tube mill the supplier has agreed to a cancellation clause until January 15, 1951. It was the unanimous decision of the Committee that these purchases be aproved. Mr. Fraser pointed out that an additional $50,000 would be needed to complete the tube mill if the order is not cancelled prior to January 15, 1951.

Mr. Fraser further reported on his very satisfactory talk with Mr. Andersen who indicated that he was willing to stay with the company at least until January 3, 1953.

A discussion followed covering certain features of a deferred compensation plan but no decision was made pending further study by Messrs. Fraser and H. T. Dyett.

Mr. Rolston reported on expansion plans of Southern Electrical Corporation in the manufacture of aluminum. He also advised of the speed at which this company is drawing aluminum. It was thought that a further study of developments at Southern Electrical Corporation might be made.

[fol. 4914] Mr. Ellis presented the following E.R. which was unanimously approved:

E.R. No.		Amount
1418	Furniture and Fixtures to be purchased during second half fiscal year 1950	$3,850.

The Secretary advised that a Corporation Deed-Easement resolution should be approved at the meeting covering water rights at the Torrance Plant and after discussion, upon motion duly made, seconded and unanimously carried it was

Resolved, that for and in consideration of the sum of $1.00, the Corporation does hereby grant, convey, and dedicate to the City of Torrance the right of way for the construction of water line and appurtenances thereto, situated in the County of Los Angeles, State of California, described as follows:

> Beginning at a point S. 89° 25′ 50″ W. a distance of 432.99 feet from the Southeasterly corner of Lot 5 of Tract 5944 as recorded in Map Book 64, page 82 of Records in the County Recorder's Office, Los Angeles County, State of California; thence N. 0° 34′ 10″ W. a distance of 312.02 feet to the Southerly line of Lot 29 of said Tract 5944; thence S. 89° 25′ 50″ W. a distance of 5.00 feet; thence S. 0° 34′ 10″ E. a distance of 312.02 feet to the Southerly line of Lot "A" of said Tract 5944; thence N. 89° 25′ 50″ E. a distance of 5.00 feet to the point of beginning.

There being no further business to come before the meeting it was adjourned.

John H. Dyett, Secretary.

[fol. 4915] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 54

To: A. D. R. Fraser
From: R. A. Schatzel
Date: March 28, 1951
Subject: Aluminum

CC: G. E. Rolston

This is not a new subject in our discussions and we decided several months ago to produce Aluminum Line Wire and Self-Supporting Service Drop Cable. This would involve our purchasing #6—4 and 2 AWG. solid and stranded Aluminum conductor and insulate with Neoprene or Polyethylene in our mill. When volume of such wire warranted our devoting a machine to it we could draw such wire without difficulty. I believe arrangements are now made to purchase such wire when C.M.P. goes into effect around July.

If C.M.P. does not go into effect we would apply for permission to use Aluminum and produce such wire.

This restricted field appears to be a very sound application for Aluminum. As I mentioned sometime ago, and as we know when the presently contemplated construction is completed we will have, within a few years, double the ingot production of Aluminum in this country. A similar expansion is taking place in Canada; in fact, a greater expansion. It is estimated that there will be an abundance of Aluminum ingot available, beyond our normal peacetime, or even the present emergency needs within a period of about three years.

The efforts of Kaiser, Reynolds and Aluminum Company of America have created a wide interest in Aluminum, for certain insulated cables.

In Boston last week Mr. Avila of Boston Edison stated, "we will just have to learn how to use Aluminum; because of cost".

I have received an invitation to attend a special meeting of Committee IX of the Signal Section of Association of

American Railroads on April 3. Among the subjects to be discussed is substitute materials, and Aluminum conductors suitable for Railroad use.

I believe the approach we would make in producing a limited line, where Aluminum has found ready acceptance, is sound.

I would suggest that, if we find C.M.P. is not to be made effective, we apply for a position in Aluminum as above outlined. If we are to start production in July or August we would need to place an order for such conductor sometime in April or May.

I believe that the situation on Neoprene will be considerably relieved by August.

RAS-P R. A. Schatzel

[fol. 4916] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 55

To: J. R. Woods
From: R. A. Schatzel
Date: April 26, 1951
Subject: Consumers Power Corp., Self-Supporting SD
CC: F. S. Marks and AERF, A. K. Buckenmaier

Dear Jack:

Thanks for your fine letter of April 12. I can appreciate that you are disturbed by the importance which aluminum has taken, particularly for SD cable, both open wire and self-supporting. I believe we can best meet a situation by recognizing the facts. We have watched this situation for some time. Utilities throughout the country have been making similar studies and many have made trial installations over the past few years. They had a bad scare sometime ago over the shortage of copper and have not forgotten it. There is an aversion to the use of aluminum because of its low strength, difficulty to terminate, tendency to break wherever it is notched, as by a knife in stripping insulation. There is much for each utility to learn before they can have a trouble-free system approaching the experience with copper. However, there is a great economic incentive at the present time and with proper training and

precaution there are some places where aluminum can satisfactorily substitute for copper. Service Drop Cable—Self-Supporting type, is one of them. Open wire in light loading districts is another. The use of Copperweld or ACSR messenger in self-supporting type eliminates the great disadvantage of low strength which Aluminum, by itself, has.

If the utilities are satisfied to use Aluminum SD we may consider supplying it later in the year and your suggestions on this will be appreciated.

Now to turn to questions you raise. Copper is superior to aluminum for practically every application. Inherently aluminum has technical disadvantages. Your questions, however, are largely economic.

1. If I were to gaze in the crystal ball I would say that the price ratio between aluminum and copper would remain in the future and probably increase in favor of aluminum. The reason for this is that there are large new sources of aluminum being developed which will more than double the ingot capacity of aluminum in this country and Canada. No similar expansion of copper is in sight.

2. In heavy loading areas aluminum lines are not reliable. In light loading areas, or where structures involve ACSR there is no question that aluminum installed costs are in about the same ratio as the cable cost, and lower than copper.

[fol. 4917] *3.* Rome would furnish copperweld messengers for copper ,or hard-drawn copper. Either is OK with us.

4. On cable above #4 AWG. aluminum (#6 copper equivalent) cost is in favor of aluminum. We refer now only to Service Drop.

In the matter of attachment I enclose some information obtained from Public Service of Northern Illinois and Detroit Edison. You are very close to Detroit Edison and I believe it may be well to discuss this with them. The attached sketches show practical methods which have proven satisfactory.

As you probably know, Detroit Edison have approved our all Neoprene construction, and I understand from Bob Graham's visit, that they are very well satisfied with it.

Summarizing, I believe there are economic advantages

for certain applications of aluminum for electrical conductors which no utility engineer may afford to overlook. We as a manufacturer of cable must also consider these advantages.

There are well known technical disadvantages of aluminum and for many applications these far outweigh the economic.

In certain locations after crews are properly trained and practical experience is gained, aluminum can be as satisfactory as copper and the economic advantages realized. Self-Supporting Drop wire with Neoprene insulation appears to be one of these. There are precautions to be observed and any company would be ill-advised to rush headlong into it. Open wire for light loading districts has possibilities, although I hear that heavy wind storms have taken down all straight aluminum lines in Oklahoma. ACSR has the required strength.

We believe Consumers Power should study the application of aluminum for Service Drop and other applications just as we are. There is much to be learned about installation and installation practices.

Copper is an ideal material both physically and electrically and we all have years of experience in its use. Aluminum is not as ideal and many adjustments must be made and much experience gained before it can be as satisfactory.

RAS P R. A. Schatzel

[fol. 4918] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 56

Minutes of Meeting of Board of Directors of Rome Cable Corporation, May 18, 1951.

A special meeting of the Board of Directors of Rome Cable Corporation was held in the main office of the Corporation, Ridge Street, Rome, New York, on Friday, May 18, 1951 at 10: A.M.

There were present: Messrs. Fraser, H. T. Dyett, Barnard, J. H. Dyett, Collins, Ellis and Rolston, being a ma-

jority of the members of the Board and a quorum. Messrs. Loeb and Sharp were absent.

Mr. H. T. Dyett, Chairman, presided and Mr. John H. Dyett, Secretary of the Corporation, acted as Secretary of the meeting.

The Secretary presented to the meeting a copy of the Notice of Meeting, together with his affidavit of service thereof, and upon motion duly made, seconded and unanimously carried, it was

> Resolved, that the copy of Notice of Meeting together with his affidavit of service thereof, as presented to the meeting by the Secretary, be and they hereby are approved and ordered prefixed to the minutes of this meeting and marked Exhibits 1 and 2 respectively.

The Secretary read the minutes of the Board of Directors meeting held February 21, 1951 and the minutes of the Executive Committee meeting held April 30, 1951, which minutes were approved as read. Upon motion duly made, seconded and unanimously carried, it was

> Resolved, that all actions of the Executive Committee since the last meeting of the Board of Directors be and they hereby are approved to be the actions of the Board.

The Chairman read the report to the Board of Directors covering operations for the last quarter. Upon motion duly made, seconded and unanimously carried, is was

> Resolved, that the report of the Chairman be accepted and placed on file.

[fol. 4919] In his report, the Chairman recommended consideration be given to payment of the Preferred Stock dividend. After discussion, upon motion duly made, seconded and unanimously carried, by roll call vote, it was

> Resolved, that there be and hereby is declared from the earnings of this Corporation, Dividend No. 20 for 30 cents per share of the 4% Cumulative Convertible Preferred Stock of the Corporation payable July 2, 1951 to holders of record on the 11th day of June,

1951. The Treasurer is directed and authorized to cause the same to be paid on the date specified.

In line with the recommendation in the Chairman's Report as to the Common Stock Dividend, upon motion duly made, seconded and unanimously carried, by roll call, it was

Resolved, that there be and hereby is declared Dividend No. 49 for 25 cents per share on the Common Capital Stock of the Corporation, payable July 2, 1951, to holders of record at the close of business on the 11th day of June, 1951. The Treasurer is directed and authorized to cause the same to be paid on the date specified.

The Chairman advised that with each declaration of Common Stock dividend in the past an Employee Dividend had also been declared and in view of the above declaration asked for a resolution covering employee payment. Upon motion duly made, seconded and unanimously carried, by roll call vote, it was

Resolved, that whereas there has just been declared Dividend No. 49 on the Common Stock of this Corporation authorizing payment of 25 cents, of which 20 cents is regular and 5 cents extra, per share on July 2, 1951 and

Whereas, the rules and regulations of the Employee Dividend-Sharing Plan, as approved by the Stockholders, permit payment to employees at the same rate as to stockholders based on computed participating units and upon approval of such payment by the Board of Directors, be it

Resolved, that the Treasurer is authorized to make such distribution to all eligible employees on July 2, 1951.

The Secretary advised that 4302 shares of Cumulative Convertible Preferred Stock had been purchased for the sinking fund and after discussion upon motion duly made, seconded and unanimously carried, it was resolved that

[fol. 4920] Whereas, the Certificate of this Corporation filed pursuant to Section 11 of the Stock Corpora-

tion Law, dated the 20th day of June, 1946, creates a sinking fund for the retirement of this Corporation's 4% Cumulative Convertible Preferred Stock and in connection therewith provides in paragraph III D as follows:

"D As and for a sinking fund for the retirement of the 4% Cumulative Convertible Preferred Stock, the Corporation shall, during each fiscal year, commencing with its fiscal year beginning April 1, 1948, apply a sum equal to 5% of its net earnings for the preceding fiscal year, in the purchase, at not exceeding the then current redemption price, and/or in redemption and retirement of shares of the 4% Cumulative Convertible Preferred Stock."

and

Whereas, the "net earnings of this Corporation as defined in paragraph IV 9 of this Corporation's Certificate of Increase of Capital Stock, Authorization of New Shares and Classification of Shares, filed pursuant to Section 36 of the Stock Corporation Law, dated the 19th day of June, 1946, means "the net income of The Corporation and any subsidiaries on a consolidated basis as determined in accordance with generally accepted principles of accounting practice"; and

Whereas, said net earnings so determined for the fiscal year of this Corporation preceding April 1, 1951 (viz., its fiscal year ending March 31, 1951) amount to $1,922,136 and 5% thereof amounts to $96,106.80 and

Whereas, this Corporation has acquired, at a total cost of $96,146.25 and now holds 4302 shares of its 4% Cumulative Convertible Preferred Stock; and

Whereas, paragraph IV 5 of said Certificate dated the 19th day of June, 1946, provides as follows:

"5. Shares of Preferred Stock that shall have been redeemed, or that shall have been purchased pursuant to (or purchased and for which credit shall have been taken against) any obligation of the Corporation for the purpose of a sinking fund, or that shall

have been converted into shares of any other class or series, shall not be reissued or otherwise disposed of and shall be cancelled. Any other shares of Preferred Stock acquired by the Corporation, except as otherwise provided herein, may be reissued."

Now, Therefore, be it

Resolved, that the 4302 shares of 4% Cumulative Convertible Preferred Stock so acquired and now held by this Corporation be deemed to have been purchased pursuant to the obligation of this Corporation under [fol. 4921] the sinking fund provisions hereinbefore set forth, and that said 4302 shares of said 4% Cumulative Convertible Preferred Stock be retired and cancelled and shall not be reissued; and be it further

Resolved, that this Corporation eliminate the said 4302 shares of its 4% Cumulative Convertible Preferred Stock by filing a certificate for that purpose with the Secretary of State of the State of New York pursuant to Sec. 28 of the Stock Corporation Law; and it was further

Resolved, that the President or a Vice-President and a Secretary or an Assistant Secretary of the Company be, and they hereby are, authorized and directed to prepare, execute and file such certificate and to take all proceedings and steps necessary to accomplish the elimination of such shares.

The Secretary presented to the meeting a proposed notice of meeting of stockholders, proxy statement and form of proxy. After discussion, upon motion duly made, seconded and unanimously carried, it was

Resolved, that the Secretary of the Corporation be and he hereby is authorized and directed to call the annual meeting of the stockholders of the Corporation for June 20, 1951 at 10 o'clock A.M. Eastern Daylight Saving Time to be held at the office of the Corporation, Ridge Street, Rome, New York and it is

Further Resolved, that the stockholders of record as of the close of business May 18, 1951 shall be entitled to notice of, and to vote at, the meeting to be held June 20, 1951; and it is

Further Resolved, that the notice of meeting, proxy statement and form of proxy, all as presented to this meeting; be and they hereby are in all respects approved as to form and content; and it is

Further Resolved, that the Secretary of the Corporation be and he hereby is authorized and directed to file the notice of meeting, proxy statement and form of proxy all as in the form presented to this meeting, with the Securities and Exchange Commission, and to mail the same not later than May 25, 1951, with such changes as the Executive Committee of the Corporation may hereafter approve, to stockholders of record as of the close of business, May 18, 1951; and it is

Further Resolved, that the copies of the notice of meeting, proxy statement and form of proxy be placed on file.

The Secretary read the annual report to stockholders and presented the financial statements thereto annexed and upon motion duly made, seconded and unanimously carried, it was

[fol. 4922] Resolved, that the annual report to the stockholders and the financial statements thereto annexed be and they hereby are in all respects approved as to form and content, and it is

Further Resolved, that the Secretary of the Corporation be and hereby is authorized and directed to file the annual report to stockholders with the financial statements for the fiscal year ended March 31, 1951 thereto annexed, as in the form presented to this meeting, with the Securities and Exchange Commission, and mail the same not later than May 25, 1951 with such changes as the Executive Committee of the Corporation may hereafter approve, to stockholders of record as of the close of business May 18, 1951;

Further Resolved, that a copy of the annual report to stockholders with financial statements for the fiscal year ended March 31, 1951 thereto annexed be placed on file.

The Secretary advised that with the conversion of the 4% Cumulative Convertible Preferred Stock of the Com-

pany stockholders were receiving Common Stock Fractional Scrip, for which a provision to purchase should be made. Upon motion duly made, seconded and unanimously carried it was

Resolved, that, subject to statutory and contractual limitations, the President, Treasurer or Secretary of the Company be, and each of them hereby is, authorized in the name of, and on behalf of, the Company to purchase, from time to time, the Company Common Stock Fractional Scrip, resulting from the conversion of the Company's Preferred Stock, whether or not the certificates for such Scrip were issued more than three years prior to the date of purchase thereof by the Company; and be it further

Resolved, that the President, Treasurer or Secretary of the Company be, and each of them hereby is, authorized in the name of, and on behalf of, the Company, from time to time, to sell, assign, transfer and deliver the Company's Common Stock Fractional Scrip acquired pursuant to these resolutions, and be it further

Resolved, that the price at which Fractional Scrip shall be purchased or sold pursuant to these resolutions shall be the market price, on the date of any such purchase or sale, of a full share of the Company's Common Stock multiplied by the fraction to be purchased or sold, as the case may be; and be it further

Resolved, that the President, Treasurer or Secretary of the Company be, and each of them hereby is, authorized in the name of, and on behalf of, the Company to deliver certificates for Common Stock Fractional Scrip, which may hereafter be owned and held by the Company, aggregating rights to receive one or more full shares of Common Stock to Guaranty Trust Company of New York, Transfer Agent, in exchange for a full share or shares of the Company's Common Stock; and be it further

Resolved, that said officers of the Company be, and they hereby are, authorized and empowered to execute such documents,

[fol. 4923] Take such steps and perform such acts as may in their judgment be necessary or incident or

convenient to the carrying out of the purposes of these resolutions, and any such documents executed or acts taken by them shall be conclusive evidence of their authority in so doing.

The Secretary reported that approval of the auditing firm of Ernst & Ernst for the ensuing year should be considered and upon motion duly made, seconded and unanimously carried, it was

Resolved, that the firm of Ernst & Ernst be and hereby is designated as auditors for the fiscal year ended March 31, 1952.

In line with the Chairman's Report unanimous approval was given to the following E.R.'s and additions to E.R.'s:

E.R. No.	Rome Plant	Amount	
4914	Purchase and install two lighting transformers each 50 KVA, 2300 V Primary, 110 V Secondary	$ 3,000.00	
1450	Purchase and install one 12-wire 8" High Speed Tubular Strander, which will replace a 7-wire 8" Strander #38-14	16,000.00	
1451	Purchase and install one 7-wire 12" High Speed Tubular Strander, which will replace a 7-wire 8" Strander #38-11	13,000.00	
1452	Purchase and install two magnetic gauges on flat rolling machines	4,000.00	
1453	Purchase and install pneumatic oven operating device on Machine No. 55-1	300.00	
1454	Purchase and install a ventilating fan over the Sheeting Mill under 3-A Banbury Mixer in the Plastic Mixing Dept.	500.00	
1455	Construct and install three (3) improved-type payoffs at sparking units in Synthinol Dept.	500.00	
1456	Purchase and install one (1) Barrett Yarn Saturating Machine	10,400.00	
1457	Complete enclosure for three (3) trucks at Shipping Dept.	18,000.00	$65,700.00
[fol. 4924]			
1415-A	For an additional appropriation to cover additional cost of office addition as shown on the attached tabulation	$22,854.20	
	Torrance Plant		
C-98	Let contract for grading and paving areas #2 and #3, 57,675 sq. ft., and resurfacing area #1, 14,430 sq. ft. Paving to be 4" asphalt concrete over asphalt concrete over 2" base of local material. Resurfacing to be 2" with asphalt binder for water seal on all edges.	10,600.00	
C-105	Purchase 1 Mercury Abrasive cutoff saw with 7½ H.P., 220 V, 60-Cycle, 3-Phase motor & control	730.00	

E.R. No.	Supplemental E.R.'s—Rome Plant	Amount	
C-109	Purchase 1-Landis "Lanhydro" automatic double end pipe threading machine	25,000.00	
C-110	Construct storage and operating racks for elbow plater	187.77	$36,517.77
	Supplemental E.R.'s—Torrance		
C-34-B	Distribute professional fees to North building extension	2,928.00	
C-35-C	Distribute professional fees to office modification	816.00	
C-36-B	Distribute professional fees to machine shop addition	722.00	
C-50-A	Make additional expenditures on slitting line installation	10,200.00	
C-79-B	Purchase and install additional equipment for sulphuric acid storage rack	350.00	
C-88-A	Distribute professional fees to hot dip building	10,534.00	$25,550.00

The President reported that an advertising budget had been submitted by Mr. Thayer, and after discussion upon motion duly made, seconded and unanimously carried, it was

> Resolved, that an advertising budget of $125,000 for the 1951 fiscal year be and hereby is approved. Suggested financial advertising in certain papers and magazines was presented by the Secretary, and it was the [fol. 4925] unanimous decision to leave final approval to Messrs. Fraser and J. H. Dyett.

Consideration was given to having an appraisal made of the Company's Torrance property, and after discussion upon motion duly made, seconded and unanimously carried, it was

> Resolved, that an appraisal of the Torrance property be and hereby is approved to be made by the American Appraisal Company at an estimated cost of between $5000 and $6000.

A full discussion followed covering price and wage levels, the possibilities of aluminum drawing equipment and other general subjects.

There being no further business to come before the meet- it was Adjourned.

John H. Dyett, Secretary.

[fol. 4926] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 57

Mr. A. D. R. Fraser

To: Mr. H. T. Dyett
From: R. A. Schatzel
Date: July 5, 1951
Subject: Aluminum

It is estimated that with the completion of facilities now under construction the ingot supply of aluminum in the United States and Canada will be approximately doubled during 1952. Further aluminum expansion by Aluminum Company of America at Wenatchee, Washington, 170 million pound Reduction plant at a cost of 40 million dollars is now decided on. In British Columbia at Kitimat an additional 220 million pounds annually at a cost of 160 million and a 45 million dollar Reduction Plant in Quebec will all tremendously and nearly triple present capacity in the next four years. This will all be reasonably low cost production.

The outlook for aluminum is that even with all wartime requirements there will be a surplus of aluminum for civilian use. Processing facilities to handle this will, no doubt, lag behind the primary supply, but this also is being greatly added to by Alcoa, Kaiser, Reynolds and U.S. Aluminum. The latter three with the aid of Government funds.

There is no need for review of Copper. Richer ore supplies are being depleted. Expanded industrial requirements world wide make a constant demand for more metal. Higher prices and a diminishing supply are probable. The trend of Aluminum and Copper are opposite each other. The spread in price between the two will be continually more favorable to aluminum.

There is a natural reluctance to the use of aluminum in the Wire industry. This is because of lower strength, lower conductivity, and consequently larger dimension—difficulty in soldering and difficulty in terminating. Despite these inherent disadvantages aluminum with steel reinforcing has captured the field of bare transmission conductors for medium and high voltage. There were many problems of terminating, vibration fatigue, etc. to overcome. But these

have been overcome in addition to the engineers' aversion. Except along seacoast areas where salt spray is particularly severe ACSR is the standard high voltage bare transmission conductor. About 75% of the total conductor miles 33000 volts and over were aluminum. It is probably higher now.

For insulated conductors Aluminum still has many hurdles and its inherent disadvantages are more formidable so that in some fields it is doubtful that it will ever be used except in an emergency by Government decree, as in Germany during the last war. These we can rule out of any present consideration. They are, Magnet wire, flexible cords, appliance wiring, flexible cables of all sizes. There are other fields of insulated conductors where the use of insulated [fol. 4927] aluminum conductors are of very doubtful possibility.

Building wire sizes 6 and smaller. Here, even if a very large price saving were (and is) possible, aluminum is not a good substitute for copper. To overcome weakness of strength the conductors must be used hard. They are therefore stiff, subject to fatigue and crack on bending if kinked. They are used by unskilled workmen and dangerous to safety. When installed the surface oxide is highly insulating and leads to a high resistance and unsatisfactory service. New methods may possibly be found to overcome some of the present deficiencies, but I do not feel it a good bet that all will be overcome.

Weatherproof H.D. Aluminum in sizes #1 and larger—here strength does not permit the same pole spacing as copper. It is doubtful if the differential in price would make up for the added labor and pole cost for closer pole spacing.

Insulated conductors generally installed in raceways, ducts, and similar confined space. Space is a valuable attribute and asset in design. In most cases replacements are being made to get more copper in the same space through improved insulations, design, etc. The use of aluminum is therefore quite uneconomical even if technically permissible.

Aluminum has a field which we believe needs only the economic impetus of price differential which we believe is now under way.

Weatherproof—Hard-drawn aluminum in sizes up to and

including #2 which is equivalent to #4 AWG. Copper. This includes all the present contractors weatherproof sizes and a large volume of utility requirements. There are no serious problems to be overcome here, but there is a natural aversion. Aluminum is considered inferior to copper; gangs are used to working copper. The growth will probably need time and additional economic incentive.

ACSR—Bare Transmission conductors—need no comment—they are already accepted.

ACSR—Weatherproof in sizes 2 and larger. The present price differential, I believe, still favors copper generally. [fol. 4928] Special equipment is required and care in joining aluminum to copper. Insulation may be of any type—braid, knit, polyethylene or Neoprene again a question largely of economics on which we would be on polyethylene.

Building wire in sizes #1 and larger where professional electricians are traveling, and equipped with proper tools for pressure connectors and terminating methods.

Underground cable in voltages up to 5000 volts and sizes #1 and larger. This is a range where utility crews are trained and always installed with proper supervision. The danger is that over-enthusiastic advocates of aluminum, such as at present characterize Kaiser efforts, will preach its use in smaller sizes and consequent troubles condemn its use over the entire range. Some of this has already happened.

U.S. Rubber, Okonite, Crescent, General Cable, Collyer, and perhaps a few others have sold aluminum building wire. Okonite have done a good job and wired up several large installations at Indianapolis and other locations for Aluminum Co. of America. These are going good and giving good service. U.S. Rubber's experience is the opposite.

Self-Supporting Service Drop Cable. This is a construction we pioneered in copper. This is an ideal application for insulated aluminum conductor with hard-drawn copper, Copperweld, ACSR messenger. Page 72 of "Electrical West" for May describes an installation of this kind in Portland, Oregon. Conductors were supplied by Kaiser; the messenger is of galvanized steel. The conductors insulated with polyethylene. One of our best customers for copper Triplex has been Detroit Edison. Their studies indicate the possibility of saving 20 to 40% using aluminum.

We, as well as Anaconda, General Cable and Kaiser are supplying 100,000 ft. to Detroit. They also estimate they can realize a saving of $160,000. per year by using 1/0 aluminum Neoprene insulated line wire in place of #2 copper we have been supplying. This also we will need to share now with Kaiser. We are prepared to supply.

Many engineers have investigated Self-Supporting Service Drop, and are prepared to accept it. Some are investigating Self-Supporting insulated Aluminum for secondary and there is no reason to believe this will not be accepted. In-
[fol. 4929] sulated aluminum conductor for open line wire has been used and accepted, particularly in the South and West. Some go so far as to say that there is no need to use copper for any aerial use. I do not believe such a generalization can be justified at this time, but that it will grow, cannot be doubted.

We would not recommend pushing aluminum at the expense of copper, but that we be prepared to supply our customer if aluminum does continue to grow in favor as we believe it will.

R. A. Schatzel.

[fol. 4930] In United States District Court

Plaintiff's Exhibit 60

C. H. Ellis
R. M. Fraser

October 2, 1951

Aluminum Project

The estimated cost of capital items under the project of casting, rolling, and drawing aluminum is $283,530.00. This is made up of the items in the attached list. There may be a few expense items such as lighting and ventilating changes but they will be of a minor character.

The main items of equipment are the Ajax melting and pouring furnace with a capacity of 2000# per hour; the Properzi casting wheel and rolls; a 10 die Vaughn drawing

machine. This machine is recommended in spite of the fact that the total cost of the project including it is $8,589.00 more than a similar list including a drawing machine of the Southern Electrical type.

The matter of delivery requires further attention but at present the indications are that the delivery of the Vaughn machine would be no later than transformer and switch gear which are necessary.

Another reason that the Vaughn machine is brought in line is the thought that casting, rolling and drawing can be made a continuous operation. This would necessitate increasing the speed, and hence the size of motor of the "Southern" machine.

An accumulator would be installed between the rolls and the drawing machine—thus eliminating coiling, handling, and welding operations, and a DC drive would be substituted for AC. It would also be necessary to install a second spooler with drive. The estimated annual savings in labor by making the operation continuous and on the basis of a 5-day week is $46,000.00.

Two 2300 V breaker cubicles will be required at the main substation, and a 1000 KVA transformer and necessary 2300 and 440 V switch gear will be required for this department. It is suggested that this unit substation be installed in the space now occupied by the Bare Wire Inspection and Testing, which would be moved to a new mezzanine over the rod storage area.

The equipment would be located in Building #19 between the Bare Wire mill and Shipping room, and for about three-fifths of the length of that building the floor would have to be level. It is also proposed to compensate in a small degree for the loss of this area to copper storage and shipping by enclosing the open areas between the Machine Shop and the Shipping building.

While not a part of this project—it seems desirable while building alterations are being made to replace the Easterly and Southerly walls of the locker room in the Machine Shop with the customary tile partitions. The Northerly wall of the Machine Shop would under the above plans be located on the line of the Northerly wall of Building #16, and this

would provide the Machine Shop with a 50% increase in locker space, which is badly needed, and would also correct the dingy appearance of the present facilities. The estimated cost is $2,700.00.

R. M. Fraser.

Building items:				
Leveling floor, Bldg. 19	2,500		2,500	
Mezzanine for B.W. Testing	6,500		6,500	
Bldg. 19 Extension	14,250		14,250	
	$274,941		$283,530	

Estimated annual savings in labor by continuous method and on 5-day week basis—$46,000.

[fol. 4932] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 61

Engineering and Research Conference, October 4, 1951
R. A. Schatzel, Conducting

A guided tour was taken through the Laboratory in the morning prior to the formal engineering session. A varied and interesting display of samples were exhibited and a series of demonstrations were presented by the Laboratory personnel to illustrate test equipment and methods used in development work. Much interest was shown by the outside sales personnel in the attractive sample board that had been prepared by Mr. Mitrovich of our Portland sales office. In addition, exhibits prepared by the Laboratory of aluminum wire, spiral four cables, and numerous insulated cables completely illustrated Rome Cable Corporation's determination to keep pace with the latest development in the wire and cable field. The most spectacular highlight of the tour was the electrical laboratories high voltage demonstration which established conclusively the desirability of shielding high voltage power cables. Following the tour R. A. Schatzel opened the meeting and welcomed all those present.

R. A. Schatzel

Since our last meeting we have had several organizational changes. At the present time Mark Wolf is concentrating his efforts as Technical Manager of the Spiral Four Program. At the same time Mark is continuing his contact with some of our special accounts such as I.B.M., Westinghouse and Allis Chalmers. George Acock has been added to our Engineering Staff as a Product Engineer who will assist in field contacts. In addition George will continue his work with I.P.C.E.A. and N.E.M.A. At the present time it is expected that he will make most of his field trips in the Southern and Central New York territory.

Mert Williams is heading the Engineering Standards and Specifications section. John Hayes, Lew Selden and Mike Kopchik are working with Mert. In addition to working with the Engineering Standards and Specifications, Lew

Selden is taking over the Underwriters' Laboratories contact work.

I would like to emphasize that our past success and continuing success is the end result of team work between the Sales, Production, Laboratory and Engineering. In addition to strengthening the Engineering organization, we expect to strengthen the Laboratory and development work on new products.

The rubber crisis is over because we feel natural rubber is not as necessary as before due to the fact that we now have an adequate supply of synthetic rubber. In many cases synthetic rubbers are equal to or superior to natural rubbers; in most applications where natural rubber still has some advantage there are synthetic rubbers that can be used as a satisfactory substitute. At the present time the synthetic rubber industry is producing 80,000 tons of GRS rubber per month. This breaks down to 54,000 tons of "cold" rubber, 18,000 tons of "hot" and 8,000 tons of "Arctic" and other special Polymers.

[fol. 4933] Butyl

Butyl rubber is still in short supply. At the present time two plants are producing 5,700 tons a month. Two more plants are being built by the government to produce an additional amount up to 10,000 tons per month. Therefore, it is expected that the supply of Butyl for electrical insulation will increase greatly in the next six months. At the present time we are supplying low voltage Butyl for Navy contracts. We are working on a high temperature, low voltage Butyl rubber that we expect will in a large measure replace Varnished Cambric insulation. I.P.C.E.A. and A.S.T.M. are working on specifications for 80 C Butyl insulation. It should be emphasized that even though high voltage Butyl insulation costs less than RoZone, Butyl is not generally available today. Therefore, you should strive to have customers specifications and inquiries specify RoZone for the preferred insulation with Butyl, when they wish to consider it, as an alternate insulation.

A recent government order allows the broadened use of natural rubber, however, it still is not allowed for insulation under 2,000 volts, except for control and signal appli-

cations. The particular difficulty is that there has been no increase in allocations of natural rubber. Under present international conditions, natural rubber is simply a political and economic football and, therefore, is not a stable commodity.

Our present stock pile of natural rubber is approximately 900,000 tons. It is estimated that we would need 1,000,000 tons to carry on a five year war. Some of the European nations are concerned regarding the effect of our stock piling of natural rubber on world price stability, and economics.

At the present time the transplanting of the rubber trees in South America is progressing satisfactorily because they appear on the way to overcome the blight that has retarded rubber production there for many years.

To show the limited amount of natural rubber that is actually available for consumption, in 1950 this country consumed 395,007 tons in seven months. During the same seven months of 1951 our natural rubber consumption was 245,688 tons. Since our imports of natural rubber during these same months of 1951 were 395,684 tons, our rubber stock pile was increased 150,000 tons. It is expected that even less natural rubber will be available for consumption from now on. At the present time natural rubber costs twice as much as GRS.

To highlight the precarious conditions under which natural rubber is being produced today a recent letter from Malaya written during the first week of this month states that an inspection visit to a plantation was made in armor plated cars under the protection of a private Army. This convoy was subjected to continual harassment by local bandits.

Aluminum

On the question of aluminum we are taking a realistic approach. We do not intend to follow either these fanatics who would completely replace copper for all uses, or those who would oppose the use of aluminum where it is entirely [fol. 4934] satisfactory. We shall evaluate the proposed application and make recommendations in agreement with sound technical and practical consideration. In this con-

sideration we should remember that the properties of aluminum have not changed with respect to its electrical and physical characteristics. The differences that make aluminum such an important metal to us at the present time are first, economy; second, availability. Copper is still the best metal for electrical purposes when it is available at a reasonable price. For a long term swing, we expect that aluminum will replace copper only in places where copper is not really necessary. Present planned increase in aluminum production calls for double ingot capacity by 1952 and triple ingot capacity by 1954. This change over will occur just as ACSR replaced copper for overhead bare transmission lines long ago. In the immediate future we expect the use of aluminum, in place of copper, for weatherproof, self-supporting aerial cable and triplex service drop cable will continue to grow rapidly. The next field for aluminum substitution will be in underground applications, where space is not a major limitation. In the next year or two if is probable that the decision regarding the use of aluminum or copper will go out of engineering hands in many cases. It is expected that many utilities will swing over to aluminum on the basis of executive decisions, owing to the economic advantages it presents. In most cases the change over will be on a 100% basis for a particular application.

We are actively producing increased quantities of insulated aluminum conductors. You can help us by sending in all facts and rumors. We will investigate, corollate, and then pass back to you the facts. At the present time some companies are using aluminum in enamel magnet wire, but we do not think aluminum has a permanent place in this application. For some types of magnet wire it may well have an important and permanent place.

RoZone

During the past year we have had considerable experience with 15,000 volt cables insulated with RoZone. We expect there will be no change in our present voltage limits. We do expect that the use of 15,000 volt RoZone insulated cables will increase.

Shielding

We will recommend unshielded power cable from 2001 V to 3000 V. Above 3000 V we will recommend power cables with insulation shielding in accordance with our Catalog. We are willing to quote without insulation shielding on 3001 V to 5000 V power cables where customer or industry experience has proven such cable satisfactory.

All non-metallic sheathed power cable above 5000 V will be furnished with shielded insulation, unless single conductor cable on insulators.

All inquiries for semi-conducting tape should be referred to the Engineering Department. Although some members in the industry are using a semi-conducting tape as strand shielding at 3,000 volts and above, we do not recommend strand shielding until the voltage exceeds 5,000 V.

[fol. 4935] Polyethylene

There will be an international symposium at Cleveland this month at the A.I.E.E. meeting on the use of Polyethylene. Following this meeting it is expected that industry specifications will be developed for Polyethylene as electrical insulation and other uses on wire and cable, for example, weatherproof covering on line wire. We say that Polyethylene is an excellent insulation for control, signal, street lighting and some special high voltage power cable applications, such as the 15 KV Union Carbide application. The Union Carbide installation will develop a service record for high voltage power use. At the present time this is the only 15 KV Polyethylene insulated power cable that we have manufactured and we will not make any general recommendation for this use until further experience is obtained.

Equipment

Continuous Lead Press

We have purchased a new continuous lead press that should be in operation before the end of next year. The actual O.D. limits that this equipment will enable us to manufacture on Rome 60 cables will be given to you at a later date. It is expected that this continuous lead press

will give us an improved product and put us in a better competitive position.

Shielding Tape

We have installed a new machine for applying bedding tapes, tinned copper shielding tape, and rubber filled tape in one operation on shielded cables. We expect an increase in the demand for shielded cable at voltages as low as 3 KV.

Cabling Machine

We have purchased a new cabling machine that will enable us to cable a greater number of conductors in multi-conductor control cable.

Miscellaneous

The quality of our product this year has been higher than any previous year. This is attributable to the excellent team work between the Production, Engineering and Laboratory personnel. Although the number of complaints have been very few the past year, we consider any complaint serious, especially since copper is in such short supply at the present time and customers are reluctant to return materials under present conditions. Constructive complaints can be very helpful. By that I mean complaints that give a complete description and include samples and any other pertinent information that may be available. For example: Is this the first time we have furnished the wire to this customer? Has the customer changed the installation conditions before or after installation of the wire? Did the customer receive satisfactory service from the pre- [fol. 4936] vious use of our wire or perhaps from another manufacturers wire? Two recent examples of very constructive complaints which enabled us to improve our product were turned in by Jack Woods and Jack Guyer.

Bob Graham will discuss in detail our activities with RoZone. RoZone has received increased acceptance by engineering firms and utilities and other important users. Sargent & Lundy, and Stone & Webster are recent engineering firms that have approved RoZone and put Rome Cable on their recommended list. This helps all districts. Stone & Webster have given us this approval without meeting their usual requirement of either a ten year service record or a

ten year guarantee. This acceptance is another illustration of consumers faith in Rome Cable products.

As stated before, we expect to strengthen Engineering and Laboratory to broaden our research and information on our products. We must be prepared both in quality and cost to meet any situation—whether it is in material development or design.

With the introduction of aluminum we will eventually need to expand engineering services to develop installation technique.

This introduces the possibility of a whole new line of products, and a new book of questions. This, we expect, will be your and our concern during the next year and for many years to come.

Maintaining our present team work between Sales, Production, Laboratory and Engineering will enable us to improve our favored position in the industry.

[fol. 4937] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 63

Date: October 17, 1951

To: Mr. F. S. Marks
From: Mr. G. E. Rolston

CC: Mr. L. E. Wells, Mr. A. D. R. Fraser

Subject: Westinghouse Electric Corp. Sharon Plant

In order that you may be informed of developments up to date in connection with request from above to quote prices and general information concerning bare rectangular aluminum wire and glass covered rectangular aluminum wire, I have assembled all of the information in this memorandum.

1. The first request covering the entire subject is covered by a letter from Charles Duffy to A. D. R. Fraser dated October 4, 1951.

2. My first conversation is covered by memo to A. D. R. Fraser dated October 9, 1951.

3. I have had costs figured on six sizes of rectangular bare aluminum. These are covered by cost cards 00741, to 00746 incl.

4. I have secured published price information from Aluminum Co. of America and Reynolds Metals. The Kaiser Aluminum Co. stated that they did not make this product.

5. Following are the prices of the Aluminum Co. and Reynolds:

Size	Alcoa	Reynolds
081 x 204	.535¢ lb.	.51¢ lb.
091 x 410	.51	.51
102 x 410	.48	.48
114 x 410	.48	.48
129 x 410	.48	.48
144 x 325	.48	.48
Plus .01 for Annealling		Plus .01 for Annealling
Quantity Extras for each size ordered		Quantity Extras not known
1000- 2000 plus .03		
2001- 5000 " .02		
5001-10000 " .01		
10001-30000 " .005		

6. Following are the prices I quoted and our manufacturing costs:

Size	Price	Cost	
.081 x 204	.52¢	36.4	Includes Annealling
.091 x 410	.52¢	37.4	delivered to Sharon on
.102 x 410	.49¢	35.7	24 x 6 spools containing
.114 x 410	.49¢	35.6	65-75 lbs.
[fol. 4938]			
.129 x 410	.49¢	35.4	
.144 x 325	.49¢	35.6	

No quantity adders but minimum quantity per size of 1,000 lbs.

7. The prices quoted on the glass covered wire are listed opposite each item in the letter of October 4.

8. These prices were arrived at by the following method which I have been told is filed with the OPS.

(a) Figure the selling price of the size required using copper conductor.

(b) Subtract the price of bar copper (.245).

(c) Multiply the difference by 3.3.

(d) Add the price of aluminum ingot. (.195)

This gives the price of the size in aluminum conductor.

9. This formula was spot checked on an actual cost computation and found to be correct.

10. Mr. Duffy was told that these prices were believed to be conservative and he agreed to re-check with us after he had a chance to review with his people.

11. All papers are included in a folder marked:

"Westinghouse—Sharon—Rect. Alum."

Very truly yours, G. E. R.

GER:he

PLAINTIFF'S EXHIBIT 67

Aluminum Meeting Held November 29, 1951

A meeting was held on November 29, 1951 at 10:00 A.M. There were present: Messrs. A. D. R. Fraser, C. H. Ellis, R. A. Schatzel, G. E. Rolston, J. C. Ward and J. H. Dyett.

Mr. Ward presented his notes covering the meeting with Messrs. Properzi and Nichols on November 28th. He advised that EC aluminum should be annealed. Rolston replied that the rod must be annealed before drawing. In Schatzel's opinion this is guessing on the part of Nichols. Conductivity will first show up in physical properties. Fraser emphasized that Nichols had had little experience in conductors. Rolston didn't believe we will have much leeway in conductivity standards in respect to Westinghouse Transformer even if American standards were relaxed. In Schatzel's opinion we can use both S2 and EC ingots. On the S2 we can get 59% conductivity which would be okay for some items if the standard is reduced. It was pointed out that S2 production is what is being increased in this country. Schatzel stated that you could not tell the difference in installation between 59 and 60½% conductivity. Ellis thought that perhaps Westinghouse specifications should have enough leeway to provide for this. Schatzel didn't believe this was possible on magnet wire although it might be on building wire and service drop. Paper cable, however, requires even better conductivity than the present EC. Customers will begin to specify what

they want. According to Rolston, Kaiser only has one pot line on EC—in Tacoma. He couldn't find out if or what would be expansion of EC in this country. Schatzel reported that all chemical analysis had been taken out of ASTM. In Europe they are using about 54% conductivity but this cable has better physical properties. In his opinion we would gain in this country if went to this percentage. We don't use the same type of copper for different uses; therefore, why should we use the same type aluminum?

Fraser requested that Schatzel get the names of the eight installations of Properzi equipment in Europe—particularly those three interested in conductivity. He went on to [fol. 4940] state that the government feels lead can be saved by not covering aluminum in paper cable.

In respect to speeds Schatzel advised that the contract guarantees a speed of 1200 pounds an hour. According to J.H.D. the press release on Properzi mentioned production of about a ton an hour. Sprackling of Anaconda had estimated about half that production or about 500,000 pounds a month capacity. Both Ellis and Schatzel thought that on speeds we wouldn't reduce our estimates yet. They propose that we see what can be done in Davenport and where we think we can improve.

Schatzel explained that in Davenport they wanted rapid cooling since did not desire a long plastic area, consequently, the need for a smaller cross section. Fraser advised that everything points to the equipment not being too well engineered. He suggested that we get busy on possible improvements before it is delivered. He suggested the possibility of Steele working on the equipment. Ellis agreed he would be excellent for gadgets and refinements while Fitler would be assigned for long range developments. Schatzel suggested that we might employ a metallurgist for aluminum and that we should make a study of furnace linings. Tama of Ajax had reported that we would have no trouble with the furnace. Friends of Fraser's at Norton might be of some help on any furnace problems. According to Fraser, we have experienced a power reduction unit cost of 6% because of Spiral 4. Although in order to get away from gas, electrical heating for annealing had been tried and found wanting, study should be made on aluminum although Ellis doubted its practicality.

Fraser requested a report from Ward on Aluminum and what the equipment will do. In Schatzel's opinion the equipment will cast aluminum and most likely EC, but many refinements are needed.

Fraser asked several questions covering the projected production as agreed above, limitations on drawing, contacts as to sources of aluminum, where we can purchase and first quarter allocations. He also wanted any suggestions on how we can arrange for second quarter aluminum allocation before the December 11th Wire Industry Ad- [fol. 4941] visory Committee meeting. In his opinion starting with the month of April we should submit information on orders on our books as we do for copper.

Schatzel reported that Nichols had indicated he might make an arrangement with us to run the ingot aluminum in second quarter so that we could get experience. This would be feasible only if we can draw the wire. If Westinghouse gets 150,000 pounds will come to us in the form of rods from Alcoa with breakdown to be performed on our bull block. In response to Fraser's statement that we did not wish to buy all our aluminum from Southern if can get service from any other source, Rolston stated that Aluminum is not living up to its promises at least on rods. He did not know about its wire customers. It was Fraser's thought that we skip Kaiser this quarter but a contact should be set up by the Purchasing Department. When our allocation is received for the first quarter it was decided that Fraser, Rolston and Dyett decide how it should be obtained with the thought that we would cover present orders with Southern and leave a balance for discussion with Alcoa if possible. Dyett was to ask Williams once more to request prices on rods, solid and stranded bare, from Alcoa.

Fraser requested that Ward get from each of the group what wire and brass mill products would continue as aluminum when copper was more plentiful. Schatzel explained that with a continuing economic advantage the following products would find use for aluminum—service drop, some service entrance, large size of building wires and power cables, (not paper, but such as aerial, industrial plant and utility needs). Aluminum won't replace copper in all building wires or in any place where ducts or space limitation.

He was amazed with what Germany had done with aluminum but its use had never gone below size #22. He described the use of #20 copperweld in cords for electrical drills, etc., (not yet approved). We are drawing some samples at present and a visit to Oswego is planned where small sizes of Copperweld are being drawn and annealed. Rolston explained that we have run into trouble when drawing aluminum down to #24. Therefore, there is a [fol. 4942] problem for small electronic devices as seven strands are needed. Since no carbon copperweld available there is as much strength in size #30 as we get in size #22 copper. We are at present drawing size #14 copperweld down to #30. Any purchases of copperweld will be taken out of our copper allocation. Schatzel said we are getting electro-plated samples from Kenmore. It was agreed that the field for fine wire aluminum was very poor.

A general discussion followed as to the future availability of copper as opposed to aluminum. Dyett was to check with the copper producers as to what copper might be available for next five years. The vast expansion of certain industrials was covered although a change in economic conditions could rapidly alter the availablity of metals. Ward was asked to check with Scovill and Chase Brass as to what their opinion is on items in their business that will stay in aluminum. Schatzel brought out the use of lead-steel on plastic water pipe instead of copper.

In line with Ward's study he will consider other products than wire that might fit into our aluminum production. Among other products nails were mentioned. Some 850,000 tons of steel a year are used in the production of nails, which illustrates a large market. At present aluminum nails are not available locally. Before we make any decision on other products, however, we must determine whether we have enough capacity with one machine for products outside the wire field. There might be some uses for aluminum in Torrance such as irrigation pipe. In respect to Polyethylene on EMT Schatzel mentioned that it looked expensive but there might be other uses. Rolston could not understand why Polyvinyl had not been used.

Rolston warned that we must have our program set shortly, so that our fabricators won't think of buying Properzi equipment. He mentioned crazy prices on aluminum

wire at present. In respect to these Fraser stated that before we have our own equipment installed our costs will vary three or four cents higher than after we are operating from the ingot. We might suffer cost-wise until that time. [fol. 4943] Schatzel wished to develop what we would do on a near and long term basis in aluminum with special emphasis on products outside the wire field. In Rolston's opinion if we go into ACSR we will be involved in considerable testing equipment. Southern Electrical has a 50 foot bent plate, and the estimated cost of a straight tensile tester would be $18,000. He emphasized it would be difficult to have testing done outside. However, Schatzel did not think the testing program was too difficult with the exception of long test for the government which he also believes can be done quite simply. Fraser queried who our customers would be. It was Rolston's thought that we could go as far as Virginia competitively on ACSR. The biggest ACSR use is about 13,000,000 feet a month. Ellis mentioned that 500,000 feet a month for us shouldn't be too large, but Rolston pointed out the difficulty of getting 4% of total sales in the country shipped from Rome. He mentioned that American Gas and Electric (60% of the utility business in Ohio as well as other mid-western states including West Virginia) is the greatest exponent of aluminum.

Fraser thought that counting on 1,000,000 pounds of insulated aluminum a month was too much. After deciding how much should go into this type we should then check the fabricators, then nearby utilities and finally such products as nails. He emphasized that we should remember one of the things in favor of the Properzi equipment was the ease with which it could be moved. As a reply to his statement that he doubted that we would get 1,000,000 pounds per month both Schatzel and Ellis restated that this production should be realized in a year's time. After discussion between Fraser and Rolston it was the decision that the following breakdown of our sales on a monthly basis might be as follows:

150,000 pounds a month for fabricators
(if not all in the form of bare wire
might sell some rods)
75,000 pounds Westinghouse

400,000 pounds ACSR
[fol. 4944] 375,000 pounds insulated products
(equivalent of about 800,000 pounds in copper)

In anticipation of production of ACSR consideration was given to stranding equipment. Schatzel outlined a study should be made of where we would put new stranding equipment and whether the old building on Madison Street would suffice. Ellis rejoined that we were making a study of which way the plant operations should run—in which direction material would flow. A study is also being made of handling costs under varying schemes. Rolston pointed out that more stranding would be necessary in aluminum wire than in copper since the use of larger cables is necessary. Fraser asked him to make a special study of this although Rolston is not in a position yet to tell change-over sizes. Ellis will request Bob Fraser starting an equipment review. In respect to this Rolston did not think that we could produce satisfactory ACSR in the larger sizes on a rigid frame strander since we have experienced trouble on hard copper. Fraser answered that Southern had a 61 strand rigid type strander in 1948 but may have a new different type strander. (In checking with R. M. Fraser discovered that the second strander was also the rigid type.) Tessmann has gone as high as 4,000,000 pounds of aluminum a month. He believes that New England is a good territory for ACSR.

Rolston reported that most companies have given up promoting aluminum in small solid wires in the building field but will continue to promote six stranded and larger in this same field. Fraser recommended that stranding and testing are problems to be turned over to Ellis. Rolston did not anticipate any difficulty in getting rating assistance for any new equipment. Fittings must be lined up if we go into ACSR according to Schatzel who thought that Alcoa and Burndy would supply.

Rolston emphasized the seriousness of what scrap had done to our cost estimates on aluminum. We should devise means of saving insulated scrap since at present the aluminum melts in our scrapping process. Dyett reported that some of this aluminum insulated scrap had been sent to American Metal to see what could be done at the refinery. Rolston reported that the waste totaled about 6%. Schatzel

stated that we could re-use any scrap material which the Properzi equipment produced.

[fol. 4945] In addition to Westinghouse Rolston thought that our other transformer customers would be forced to aluminum. He could not see us in automotive wire field. At present aluminum is being used in starter cable.

In the non-electrical use field (or cold-headed products) are nails, machine screws and rivet wires which would bring us into the problem of alloys. This alloy situation, according to WARD, would present us with the problem of more melting diversity. There would be a question of emptying the furnace. Rolston said that most of the non-electrical uses would be from S2. Schatzel outlined the possibility of using the first Properzi for electrical purposes and another for non-electrical.

Schatzel wondered whether the production of nails is a good field. There might be a potential of 50,000 tons of aluminum a year based on galvanized steel nails. Ward advised that airplane rivets is a cyclical business as is true of the nail market which is both highly cyclical and competitive. If we serviced a nail manufacturer it would have to be largely on the basis of our location. He wouldn't state whether or not it might be interesting to us without making a survey. Schatzel posed the question of what we would do if we had a second Properzi furnace in another location with its extra capacity in the event that we only needed part of it for electrical. Fraser emphasized that we were looking for something in this non-electrical use which could help us in poor times.

Schatzel brought out the subject of pipe. We would start with ingot, melt and then process. It might resolve around buying aluminum pelletized which would not be connected with the Properzi method. Ward brought out the question of small piping in various types of equipment as well as whether or not plastic could compete with aluminum or copper tubing. In Schatzel's opinion these two latter types are expensive. Ellis mentioned that Nichols' business was mostly in clothes line which sold extensively in his territory. However, Schatzel did not think much of this type clothes line. Ellis mentioned the possibility of manufactur-

[fol. 4946] ing stock pins for electric furnaces since they stand up better than galvanized steel.

[fol. 4947] In United States District Court

Plaintiff's Exhibit 68

Aluminum Meeting Held January 4, 1952

A meeting was held on January 4, 1952. There were present: Messrs. A. D. R. Fraser, C. H. Ellis, G. E. Rolston, R. A. Schatzel and J. H. Dyett.

Mr. Fraser called the meeting for the purpose of determining from whom we should do our ordering, what the supply situation might be on aluminum, what trips should be planned and any other near term angles. In respect to the equipment ($336,000. approved to date on E.R's) Ellis advised that the furnace had been promised for May and should be ready by July while the Properzi equipment should be available at the same time having been promised in April. Schatzel reported that Properzi had been running about 30 days late on deliveries. He had been told this by Mr. Hagan of General Cable who also advised that his company had purchased four Lindbergs rather than the Ajax. On furnace linings he didn't see any cause for worry, a result of the testing at Nichols.

Ellis discussed moving the elevator supply and the attendant equipment from Reliance should be available in August. It should be remembered that the 250 h.p. motor comes from Electric Machinery in St. Paul. Vaughn's spooler has been promised for August. In respect to power, Westinghouse has given an August promise but we can experiment from present cubicles. The dip system is being made here and the welder situation is satisfactory. Although the main substation is not promised until December we will be in a satisfactory position. The Vaughn 10 die machine is anticipated in October and the motor in December.

A discussion followed of what we could do on copper without production from the Elevator Supply. There is a possibility of using both aluminum and copper on this equipment. Ellis could see three months or so of troublesome operation. Fraser recommended that our Vaughn machine be completely overhauled this summer. He asked Ellis to get out figures of possible production under vari-

ous set-ups. According to Schatzel Nehring flushes out the dip when he changes metals.

[fol. 4948] Fraser queried as to when we should explore the ingot picture. It looked like about the third quarter. We could sell the rod Okonite draws from the rod. Rolston had previously thought of just wire bars. He doesn't know what Simplex program will be as they haven't been active to date, as is also the question of Walker Brothers.

In respect to the first quarter allotment everybody got the same poundage as in the fourth quarter although the list was increased from 16 to 60. Requests were made for 17 million pounds against 6 million pounds available. Fraser believed that there would be an improvement in amount in the second quarter. The important thing is to have orders which we can substantiate. Rolston pointed out that 6 million pounds goes a long way toward the approved utility use. He advised that the aluminum form has to go in on January 15th. He reported that Washington had stated that no use information should be contained in the application letter but he was wary of what the Aluminum Branch would do with insufficient information. Tickets are not available in the field; so it is impossible to get accredited orders. The whole thing is in a mess. We can build up a story of orders—can get. For instance, we could have included all of the 177,000 lbs. of the Public Service program as well as Westinghouse requirements. The Sales Department will also check on Allis Chalmers, Maloney and Kuhlman interests.

J. H. Dyett reported that no delivery information had been received on first quarter from Alcoa. (Satisfactory information giving 'early in the month' shipping promises was received later in the day. The 10,000 lbs. for Westinghouse have also been delivered.) The suggestion that Fraser might check DeKlyn on deliveries was unnecessary as the information was received through Patterson. J. H. Dyett will check to see that the full first quarter allotment is filled. Fraser mentioned that since we were taking the rod and putting it through the bull block for Westinghouse, could we take the rod through the bull block and then to the heavy intermediate while waiting for the full set-up. Ellis replied that we would be doing this on copper rather than aluminum.

[fol. 4949] Rolston reported that we could not get back our aluminum scrap on a returnable basis from American Metal. We should find out from Alcoa and Kaiser as to their interest in replacing our scrap. Schatzel stated that Kaiser was definitely interested and J. H. Dyett will discuss this with their representative when he is next in Rome. Fraser will check this situation with DeKlyn.

Fraser explained the Southern Electrical position. They delivered to us fourth quarter aluminum after which the Aluminum Division issued a directive on Alcoa. Consequently, Southern Electrical was shy 150,000 lbs. and we were unable to get Alcoa to make up this deficiency. Tessmann stated that he did not see how Southern could give us rod from one furnace unless we could get him the ingot. J. H. Dyett mentioned that Alcoa did not seem interested in the ingot business since it has excess capacity at Massena for fabricating. A visit to Alcoa is advisable some time in the early spring. Rolston thought that he could get some of the answers to our various problems in Washington. He stated that we would get the aluminum in the form in which it was allocated.

In respect to Les Fitler and Carl Ward going to Nichols Ellis thought that it should be after all equipment is installed. He will write to Nichols to find out when this might be. Schatzel is currently looking for a metallurgist. He will keep him in the Laboratory and train one of our own men for the plant.

Meeting adjourned.

[fol. 4950] In United States District Court

Plaintiff's Exhibit 69

Aluminum and General Meeting Held January 15, 1952

A meeting was held on January 15, 1952, at 2:00 P. M. There were present: Messrs. A. D. R. Fraser, H. W. Barnard, G. E. Rolston, R. A. Schatzel, J. C. Ward, Jr. and J. H. Dyett.

On ACSR a request for test equipment in the amount of $45,000 has been submitted. Mr. Fraser advised that the

line up of 1952 capital expenditures would be available when R. M. Fraser returns. He pointed out that there was still Three-Quarter Million Dollars of past programs incomplete.

According to Rolston there is nothing new from his angle on ACSR. He foresaw selling limits of 300 miles from Rome in the states of New York, New Jersey, Pennsylvania, New England States and Ohio, in which latter state Tiffin and Kaiser would be competitors. Ellis and Rolston had yet to discuss the necessary equipment. According to Rolston utility and R. E. A. complete programs total Sixteen Million pounds per month, in view of which during the first year we would be fortunate to get 500,000 pounds of ACSR a month. It looks as though we would not be in ACSR until late 1952 or early 1953. Both Schatzel and Rolston agreed that if we produce One Million pounds of aluminum a month we would need ACSR in our line. Fraser questioned on how our insulated accounts could help. For ACSR business Schatzel stated we would need tensile equipment but our testing requirements would be $25,000 less as wouldn't need modulus testing. According to Rolston 500,000 pounds a month of ACSR would represent billings of $225,000. Fraser will pass this information on to Ellis.

Rolston advised that Allen of Anaconda had stated that the Properzi equipment was experimental. They are producing ACSR at Great Falls at the present time. If the Harvey deal works out satisfactorily Anaconda expects to put rolling facilities at Great Falls and then will produce ACSR at Orange, Sycamore and Hastings. In respect to [fol. 4951] this Ward advised that he had received information from the Aluminum Division that Harvey would proceed as scheduled.

Ward advised that Texas had made requests for forging plants and other fabricators. Fraser stated that Texas prospects had been much in H. T. D's and his mind. One or more of our competitors are considering locating there. We should consider possibilities of a base operation in Texas and what the base should be. There is a possibility of a community interest such as Texans taking all Preferred Stock issue and we taking the Common. Ward told of Temco which now has ten thousand employees. Dallas and Fort Worth are now growing at the rate of four times the rest of

the country and an industrial band of plants is growing up between the two cities. This area now has one and one-half million population. There is a great deal of overhead distribution which should make for a large aluminum market. Fraser emphasized that the company who gets there first will benefit, to which Ward agreed as well as that there was money there to invest. Consolidated engineers on the B-26 are not using aluminum. They gave up after six planes as assemblers stretched the wire and Wright Field does not have the proper specification. (The B-36 uses Two Million Dollars of electrical equipment to Two Million Dollars of other materials). Schatzel pointed out that aluminum cuts too easily and a bad situation results when strip. According to Ward engineers receive $500 if they can save one pound in the weight of a plane. This is a great incentive.

Ward told of his advisory meeting in Washington. This group with forty minimum and ninety maximum in attendance meets once a month for two days and hears the members of the Cabinet, E. C. A., etc. This meeting acquaints business with what's happening and allows business men to give recommendations to the Department of Commerce. The present economic situation was covered very ably by Mr. Lazarus of Federated Stores. He said that if not for the impact of defense we would now be in a recession. At present our economy is on a flat curve. The danger in the [fol. 4952] situation is that Congress has been the watchdog of government expenditure but has now given Eighty Billion Dollars to the Executive Branch, or you might call it a blank check for the Defense Department, which can throw these monies into the pot at any time and add to the inflation or can feed it to the country as it can be absorbed. Since Air has the largest percent of these funds it can raise hob. The danger from heavy inventories at retail has disappeared but manufacturers inventories are dangerous. The public has shown common sense by saving. Mr. Lazarus summed up by saying that subject to a sensible policy of the Defense Department there should be no serious dislocation.

Ward went on to state that steel negotiation is the key to the labor situation. Historically speaking labor lost strike and union was desperate. Demanded the President bail them out. The Labor Board was constituted four, four and four, and its job was just to stabilize. Labor got an agree-

ment to enlarge the Board to six, six and six and to handle grievances in return for election support. Reeve of the Textile Union stated that everything was set and would now strike against the Board as soon as the Board was enlarged. This was highly unethical as he was a member of the Board. The Board has tried to conceal that it is a Labor Board. In Ward's opinion Wilson of General Motors has advanced a bad thesis in recognizing an advance labor trend which he says is inevitable. Too many people appeared confusing his position with his ability.

Fraser pointed out the great mistakes that have been made in government fiscal estimates. General business will be slowly declining but this can be changed by the Defense Department. According to Ward General Marshall was more interested in tools and capacity than in the final product while Lovett is slightly more realistic. We must have skill in picking the right airplane plans for production. Today's tools change as do plans. Lovett believes that the monies of the Defense Department should supplant the economy, that is, the Department should hold business level where it is by the flow of the money under its command. He seems willing to cancel excess capacity and [fol. 4953] orders. Fraser queried whether this would affect our Spiral Four program. Schatzel answered that field wire stocks are being replenished only as they are used but that Spiral Four still should continue since it has hardly been started. Fraser wondered what would happen to field wire suppliers if cut back. Would the government cut down on other business so that this could be spread around among our less fortunate competitors. J. H. Dyett mentioned that the government had just announced a policy of placing business at higher cost with companies in depressed areas. Ward mentioned that this has happened in aircraft.

Fraser reported that our reels with utilities showed a building up of wire stocks. He is sending a letter to our District Managers to get inventory information. What measures should we take in order to protect ourselves? He is getting lists of customers showing copper purchased in 1950 and 1951 and our order backlog projected into 1952. Also our customers total inventories. (This is done through our reel study.)

In Fraser's opinion our ability to get material will some time during this year meet our sales requirements. We are presently looking for companies who have pyramided orders. If we have a controlled amount of material we should pick and choose our customers. Ward advised that there had been hoarding of materials by the automobile companies. Fraser pointed out that General Electric wants to cut its inventory by One Hundred Million Dollars. This may be a warning to other people who may discover the high cost of maintaining inventories through borrowed money. Ward believes that the expansion plans of many big companies may be revised downwards and the government will some time find a plethora of copper. We should study whether or not our equipment is satisfactory for any changes in demand in housing, appliances, etc. Schatzel thought that we must be prepared for plastic powder mixing which will not be a major equipment expense. There is also the question of cold feed development. Is Anaconda ahead of us on this? Schatzel did not think so. He agreed that we might have to accelerate some of our developments. [fol. 4954] In commenting on our California Plant Ward advised that it was an interesting operation, outstanding in neatness and in new equipment. The plant gave the impression of not being crowded and much hand operations have been eliminated. The control of plating is excellent and the flying loop shows much ingenuity. He discovered very rough records and blue prints, but Fraser thought that we had them. Ward was amazed that the Machine Shop could get such good results without being well outfitted. Ward believed that the west coast plant should be digested. If we can secure volume we should have a good return. It is a big investment with small labor costs. According to Schatzel a lot of money has been made in mechanical tubing.

PLAINTIFF'S EXHIBIT 70

Meeting on Aluminum Program for Rome Cable Corporation Held January 30, 1952

Present: Messrs. A. D. R. Fraser, R. A. Schatzel, G. E. Rolston, C. H. Ellis, R. M. Fraser, J. H. Dyett and J. C. Ward, Jr.

Ross Fraser opened the meeting by stating that the purpose was to arrive at probable types and quantities and size ranges for aluminum conductors which will probably remain in aluminum indefinitely. He stated that there were five principle objectives for discussion:

1. This refers to the first meeting on the subject and the question, namely, what products in the brass and wire mills will stay with aluminum and if so how many tons of copper will be made available.
2. A report on Bob Fraser's trip to the Hunter Continuous Casting Plant at Riverside, California.
3. How to determine the extra stranding equipment, etc. that may have to be included in the 1952 budget for capital expenditures stemming from aluminum cable in place of copper conductor.
4. Define more accurately the ACSR conductor picture so that Ellis can be certain of his equipment needs by the Board meeting of February 29th.
5. Bring up to date any new or added information that may have been gathered by those present. Note any changes in the forward equipment delivery schedules that would be significant.

Rolston desired to point out that in certain cases when aluminum conductor is substituted for copper the conductor size may be jumped four gauge numbers in place of the usual two. He cited overhead conductors size #8 copper used by West Penn Power that may be considered [fol. 4956] undersize for ice and sag load and that upon switch to aluminum will be required to go up four gauge

sizes. He also pointed out that Westinghouse, for instance, is planning to have all its small motor leads go to aluminum stranded and that in this instance they will probably not change the conductor size due to the small drop realized. No. 14-19 strand is an example. The discussion that ensued focused attention on the fact that as the conductor sizes increase in the larger ranges the strand lay may jump from 19 to 37 or from 37 to 61 thus placing a heavy requirement on the stranding equipment, even though the cable footage is not increased. It will be necessary for Mr. Ellis to estimate this effect.

At this point Ross Fraser called on Bob Fraser to report on his Hunter-Douglas Corporation inspection at the Riverside plant. Bob Fraser reported that Hunter got into the continuous rod casting through hearing about the Properzi process. He was escorted through by their Research Director, Mr. Quadt. Since they had no drawing equipment they have had the Anaconda Orange plant draw down their cast rods and thereby Anaconda had become quite interested and an active collaborator. Their equipment starts with three Ajax electric furnaces apparently lined with normal silica linings. These pour alternately into a holding furnace of the gas reverberatory type. (Note: This may be for the purpose of bringing about a reducing atmosphere.) The holding furnace pours into two troughs each ending in a refractory tip which is believed to be immersed approximately 1" in the fluid metal. Each trough fits into a caterpillar type split mold set-up. The mold sections being short blocks of steel, water cooled. The rate of casting is 6 ft. a minute and the cast ingot (of the type used for venetian blind sections) is sheared into 55 ft. lengths which are fed into a soaking furnace at 1000° F. after which they are hot rolled in eight passes. Cooled water in the mold is 97° F. and each mold block section is fed by a flexible hose attached to a revolving drum in the manner of spokes which revolve with the caterpillar mold. For wire the mold blocks are curved and cast three strands or rods simultaneously. They started with ⅜" rod and when drawn [fol. 4957] to final size the wire lacked sufficient tensile. They then went to ½" with a first draft of 40% but the finished .077 wire lacked tensile to meet ACSR requirements. They now plan to cast ¾" rod and will keep Rome informed

of the progress. They may have to cold roll several passes or pass through a double deck bull block to work the metal. In the case of the venetian blind strip this is rolled to ⅛" thick, the same width as the cast ingot, and then to .008 in a series of "H" stands to finished "blind" stock.

Schatzel: What micro sections have they taken?

Bob Fraser: There were no micros.

Ellis: What is the advantage of the Hunter over the Properzi system?

Bob Fraser: It is a better machine, having been designed and built by the Hunter organization. The pouring conditions are believed to be much better. (Probably due to the ceramic spout and the immersed condition.) In addition, one man handles two machines and each machine will cast three wire rods.

Ross Fraser stated that he felt Schatzel should look at the Hunter process in March while out at the coast meeting.

Bob Fraser: Probably through the ceramic spout there has been no iron pick up by the molten aluminum. Hunter has made no arrangements for licensing as yet although Anaconda who are doing the drawing at Orange are very interested.

Schatzel pointed out that Properzi depends upon a rapid chill for the desired structure and agreed with Rolston that if Hunter is not testing for conductivity he could be fooled by his results, although undoubtedly Anaconda was following this since they were doing the drawing. Schatzel agreed that the mold set up would be more flexible for large flats and rounds and the production of 4600 lbs. per hour is high. He agreed to make both porosity and conductivity tests on the samples Bob Fraser brought back with him.

[fol. 4958] Ellis commented that he liked the idea of casting the rod shape direct and Bob Fraser commented that by casting three wire rods simultaneously they could be fed from each mold set-up onto large reel take-ups and that this has some advantages in speeding up the drawing process. Schatzel pointed out that he knows of no extruded or cast rods successfully drawn without splits along planes of structural weekness. The rolling process in the normal fabrication brings about heterogeneity and thus eliminate the splitting. He pointed out that the extruded rods from

Scovell led to trouble in drawing, probably through lack of homogeneity. Bob Fraser pointed out that there was no splitting of the Hunter rods which drew successfully but did lack tensile. Schatzel commented that the lack of tensile may be due to porosity and this could be detected by micro sections. Rolston stated that Reynolds Aluminum casts a 1" slab and slits it into squares, then passes it through drawing dies into rod sizes, but that the customers do not like Reynolds' rods and report them as lacking in uniformity, thereby supporting Schatzel's comments. Paul Williams confirmed this to a Rome representative very recently in his experience at the Lister Hill plant where they were compelled to use Alcoa, Kaiser and Reynolds rods and the latter were distinctly more troublesome. This concluded the discussion on the Hunter process.

Ross Fraser then suggested that the stranding requirements be discussed. At this point there was an interruption due to a long distance call to Ross Fraser. Upon resumption Ellis asked what should be used for making the stranding requirements estimate—what basic assumption? Rolston pointed out that there will be no more footage used by shifting to aluminum but that the stranding lay-ups will be more complex due to the larger gauge sizes, that Ellis should start with the premise that in building wires, either plastic or rubber, the shift will increase conductor size by two gauges; that is, No. 4 strand for No. 6 strand—but pointed out that No. 8 solid in copper will undoubtedly stay as copper conductor. He feels that branch circuits will remain in copper but that main feeder circuits will swing to aluminum, thus the sizes No. 14 to No. 8 inclusive will stay copper and aluminum will start at No. 4 (No. 6 equivalent [fol. 4959] in copper.). It should be obvious No. 8 in copper will be cheaper than No. 6 in aluminum strand and that the latter size wire, while it will not drop out, will go down in volume. The overall effect will be that much more 37 strand will be used than presently due to the shift from 19 to 37 if the gauge sizes increase in aluminum. Ross Fraser threw out the suggestion that for estimating purposes we may assume 33% of present copper in appropriate sizes will switch to aluminum. Rolston warned that there would not be any appreciable effect this year due to the lag between the engineering design of systems, placing of the

orders and the delivery of the material. For instance, in the second quarter of this year for the whole country eight million pounds is allocated for aluminum conductor for utilities, one million pounds for electrical equipment manufacturers and five hundred thousand pounds for the construction program. He doubts whether by the fourth quarter there will be more than one million five hundred thousand pounds for all construction for the United States in aluminum conductor. Ross Fraser stated with an 11% cut back in copper allocation for the second quarter the aggressive section of the industry will be forced to make more substitutions for aluminum. Rolston cited as an example for his argument the Utica fifteen million dollar General Electric plant expansion program utilizing $338,000 of new wire, 245,000 ft. of conductor and 350,000 lbs. of copper and that once this is designed you cannot substitute aluminum for copper because of terminal boxes, conduit sizes, fitting sizes and the like and that such an example indicates why the effect of switching to aluminum will be small in 1952, since deliveries on the Utica project are specified for the third and fourth quarters. Washington advises that they will increase the allowance of aluminum to utilities for overhead distribution primarily other than H-3 and H-4 (utility government classification). If Rome gets the orders they will get the needed aluminum allocation. General Electric should get 25% of the total of one million pounds for electrical manufacturers allotted for the second quarter. Westinghouse have put in a large allocation but many of the electrical manufacturers are in-
[fol. 4960] active on this subject. Rolston figures that by 1953 there will be sufficient aluminum available but not in 1952 to get the desired needs. He has instructed Rome Sales to take orders for 250,000 lbs. in aluminum for the second quarter in anticipation of the allotment for which he cannot wait. This will go into Weatherproof and Drop Cable with no triple braid type. The first quarter allocation for Rome is 150,000 lbs. and that as a guess he would expect the third quarter to have upwards of 300,000 lbs. and the fourth quarter 400,000 lbs.

Schatzel pointed out that for reasons previously discussed at earlier meetings there should be no ACSR for Rome in 1952. If the Properzi equipment is available for

the fourth quarter it is conceivable that we would get some requirements and allotments from other fabricators. If we did not, then the 400,000 lbs. estimated by Rolston would provide less than one-half month's rated capacity operation for the Properzi equipment for the entire fourth quarter.

Ward inquired as to the overall effect of the aluminum plus the copper total poundage on the total mill load. Rolston replied that it will lead to a much higher mill stranding load in all probability. Schatzel quoted from a Consolidated Edison report that was very favorable to their experience on terminals for aluminum distribution network and that this will lead to the use of aluminum as an alternate for copper upon the issuance of the formal report. Schatzel believes this will have an important effect. Rolston warned that if Consolidated Edison uses equivalent resistances in conductors they cannot pull the same number of conductors in their present installed conduit sizes. Schatzel replied that they can on large portions of their system, namely Queens and the outlying sections, and that compression terminals have operated successfully. Rolston answered that economics will govern as the effect of insulation thickness, complexity and cost enters into the conductor picture. It is obvious that the larger aluminum gauge required will run up the installation cost more in proportion as the thickness of insulation and the expense of insulation increases. Schatzel stated that the final report should be made to the A.I.E.E. in March or thereabouts by Consol. Edison.

Rolston stated that Westinghouse is switching their 6-4-3-9 specification from copper to aluminum for motor leads. [fol. 4961] Westinghouse is talking of a five million two hundred thousand pound copper requirement for their corporation per month plus another one million three hundred thousand pounds for their present requirements and that Mr. Henderson of Westinghouse estimates they will need 10,000 tons per month. Rolston points out that by comparison the General Electric Company is using only 6,000 tons per month. Whether these figures are accurate or not they point to the switch to aluminum in any event and this may save money as well. Thus General Electric advises that they can switch 25% of their copper to alumi-

num conductor with no important design changes. Ross Fraser asked if Ellis is satisfied with 500,000 lb. allotment for ACSR per month as a basis for making his equipment analysis. Ellis said he was and would assume that the distribution by size would be similar to the experience of Southern Electric which was available to him. Rolston stated that we must remember 70% of Southern Electric's sales is to R.E.A. In any case he felt that capacity for large 37 and 61 strand conductor will be needed and that we may need one right now for normal growth. Ellis stated that he may not want a 61 wire machine and instead may run the wire through twice to better advantage. He will test his estimate by Southern Electric's practice and will use wire footage capacity by Larmuth machine, perhaps adding new 7 and 12 strand Larmuth type machines. He will proceed on this basis for his estimate.

Ross Fraser pointed out that we were now back to the question as raised in the first meeting and he would like a forecast as to what items in whole or in part will stay as aluminum. He used as an example the new copper clad radiator studies by Henry Ford. Rolston replied by stating that final price has much to do with this answer. He cited as a particularly bad practice General Cable's proposed pricing schedule filed with OPS for aluminum building wires as compared with copper in which General Cable apparently made the price come out for No. 6 RH in copper equal to No. 4 in aluminum even though it is obvious that the No. 4 will cost less. As a further argument against this practice it should be recognized that the purchaser [fol. 4962] will in many cases require larger conduit size and hence his switch to aluminum will increase his costs. Rolston feels that for construction wire where aluminum price savings bring an incentive that there aluminum will stay and this will be in the larger feeder sizes, say, beginning at 1/0. Schatzel commented that this not only will give economy but that in these sizes trained electricians will install the cable and that thereby there will be less resistance to the products involved and less complaints may result. The smaller sizes may at times be indifferently installed and if so aluminum conductor would give trouble and bring about sales resistance. He said he was leaving

out comparisons of a 12¢ per pound copper market as this seemed far off.

Rolston stated that in the case of service drops few fittings are involved and that after a change to aluminum is made it will stick. He feels that in general overhead distribution will go to and will stay in aluminum. The underground situation is quite complex and the use of aluminum will grow but he isn't clear yet to what extent. Schatzel stated that undoubtedly some underground will stay in aluminum in the large sizes. Ward asked about street lighting. Schatzel replied in Polyethelene types aluminum would be appropriate but as to magnet wire this is questionable except the large sizes and flats in aluminum as there should be enough copper for a non-defense economy. Ross Fraser asked who knows how long before the defense economy will be out?

Schatzel said that all insulated aerial cable, in his opinion, will stay as aluminum under normal business conditions, whenever that may be. Ellis asked what about the high cost copper producers who may be forced to go out of production when copper comes down in price? Schatzel felt that they may have to keep the high cost producers in production.

Ross Fraser pointed out that in addition to the type discussed, non-leaded paper cable is claimed to be a market for aluminum conductor. Schatzel answered Ward by stating that he felt no flexible cords or flexible power cables, welding cable, mine cables, etc. will be suitable in aluminum for mechanical reasons.

[fol. 4963] Rolston summarized as follows:

A. Type ACSR and all overhead primary and secondary conductors down to No. 4 in aluminum will stay as aluminum when aluminum ingot is 19½¢ and copper ingot is 16¢. He takes exception, however, to seacoast areas where aluminum erosion is evident and in other special applications.

B. That large size underground in sizes No. 1 and heavier will remain aluminum where the installation costs do not offset price advantage.

C. Magnet wire will stay in copper except during emergencies.

D. Building wire will stay in aluminum from 1/0 and larger for feeders and will not be used in secondary distribution.

E. Automotive wire may stay in aluminum if economy proves out but offsetting this is the problem of pressure connectors and automotive servicing which makes this complex and hence doubtful.

F. Railway requirements will stay in copper and power control cables and signal cables.

G. Marine wires and cables will probably stay in copper.

H. Aircraft cable will probably stay in copper as at present.

I. Power busses will stay in copper for mechanical reasons.

Ross Fraser then asked what the opinion was with respect to brass goods switching to aluminum. Rolston replied that overhead bus duct may be converted to aluminum and that this is a considerable tonnage. In general discussion it was agreed that much building hardware has already switched from brass to aluminum and will undoubtedly stay. That Alclad screen cloth has proven suitable in place of brass and copper and that also plastics have come in. Architectural grills and ornamental work in the construction industry have largely switched to aluminum from brass. Gift shop and novelty lines have in many instances switched to aluminum from brass or copper. The [fol. 4964] automobile industry is substituting other materials for copper and in the case of Ford expect to cut their requirements per car from 42 lbs. to 28 lbs. Ross Fraser pointed out that no doubt Revere could give a better summary of this switch from brass goods to aluminum in a post-war economy.

Meeting adjourned.

Carl Ward.

PLAINTIFF'S EXHIBIT 71

March 3, 1952

Inspection Trip to Rome Cable Co.

Preface: Messrs. Plummer & Knouse of A.C.O.A., Pittsburgh, Messrs. Holcomb, Wheater & Glascock of A.C.O.A., Massena, spent 2 days, Feb. 13 and 14, 1952 at the Rome Cable Plant, Rome, N. Y. This trip was arranged by Mr. M. E. Noyes, A.C.O.A. Product Manager for wire and cable.

Purpose—

The general purpose of the trip was to enable A.C.O.A. personnel to gain some knowledge of the insulated or covered wire industry. It has been proposed that A.C.O.A. Massena Works enter the covered wire manufacturing business, specifically to make neoprene covered weather resistant wire and cable and Triplex service drop wire, as well as polyethylene covered weather resistant cable.

Multiple purposes of the trip, in connection with the above general purpose, are as follows—

1. To study the production methods for making the above outlined products.
2. To study operational difficulties of neoprene versus polyethylene extruded covering applications to aluminum wire and cable.
3. To study mechanical and electrical equipment and facilities used in the insulated wire and rubber industry.
4. To determine what technical control problems are involved in the successful production of extruded neoprene and polyethylene wire coverings.
5. To determine temperature effect on physical properties of aluminum in covering processes.

Personalities—

During our visit we spent most of our time with the following Rome Cable men—

Mr. Charles Ellis, Works Manager
Mr. Rudy A. Schatzel, Product Development Chief
Mr. J. Carleton Ward, (Consultant on Aluminum Conductors) (Assumed this to be title)
Mr. Robert Frazer, Plant Engineer

[fol. 4966] We believe all these men had in the past worked for General Cable Co. These men extended us every courtesy and answered all questions to our satisfaction. If there was any reserve on the part of any of the men it was, we felt, a natural reaction to a future competitor. If these men tried to influence us in such a way to keep us out of the covered wire business it was certainly in a mild way and no more than we would do in similar circumstances. For example, they did not minimize operational difficulties, which somewhat discouraged us in connection with neoprene. On the other hand, they freely gave us operating speeds, costs of materials and showed us their standard operating procedures.

Discussions

Types of Weather Resistant Wire & Cable—(Cotton Knitted versus Cotton Braided versus Neoprene versus Polyethylene).

(Mr. Ellis' comments).

In the industry at present over 80% of all weather resistant wire is cotton covered. At one time, all cotton coverings were braided; now most manufacturers prefer to make knitted cotton cover because it is cheaper to make. Many Southern Utilities will probably always specify a cotton cover. If cotton drops in price, practically 100% of weather resistant wire will be cotton covered. The price of basic neoprene is pretty much fixed and stable. Polyethylene in a precompounded form is the most expensive at present—55¢ per pound at .92 gravity and also in short supply because of defense orders. In the next few years polyethylene will become more plentiful and cheaper. Polyethylene is the easiest to apply and makes a better covering, but a covered wire manufacturer for many years to come must be equipped to supply all three coverings. Rome

Cable by the end of 1952 will be doubling their present production of polyethylene covered weather resistant wire.

[fol. 4967] *Problems Confronting a New Manufacturer in Connection with Diversification—*

(Mr. Ellis' comments again).

It will be very hard to draw the line and furnish to the trade only weather resistant and Triplex wire and cable. For example, some Utilities want some rubber in the neoprene mix for Triplex cable—you must give it to them. Triplex specifications vary and the first thing you know you are applying braid and furnishing insulated wire and you will then have to go to pan vulcanizing and will have 600 mixes of covering compounds and 375,000 different products like Rome Cable makes. We told Mr. Ellis we hoped to avoid such pitfalls—he wished us luck.

Hot Process Neoprene versus Room Temperature or So-called "Cold" Process—

We indicated our interest in Western Electric "Cold" Process whereby the neoprene mix is dumped from a Banbury mixer into an extruder which produces a 3" wide strip of stock which is rapidly chilled and then can be stored and fed to the continuous vulcanizing extruders at room temperature without going either thru a sheeting mill or a warming mill as is necessary in the "Hot" Process in use at Rome Cable. The "Cold" Process requires a strainer in the head of the continuous vulcanizing extruder.

Mr. Ellis said they had a license for the "Cold" Process from Western Electric but that the process was no good for covering wire and that if it did work you would have to cut your C. V. machine speed in half and that he did not believe Western Electric had the process in operation on covered wire—though it might work on less critical operations, such as molding of battery cases. Mr. Ellis strongly felt the sheeting mill and its thorough mixing and blending, after the Banbury mixer, was essential and, likewise, the warming mill was essential. He said if you didn't do the work on the sheeting and warming mills you did it in the

screw chamber of the C. V. machine whereby you would cut the extrusion speed in half and you would have to put a lot more horsepower on the screws of the C. V. machines. Mr. Ellis felt that if we were going to tie up with the West- [fol. 4968] ern Electric "Cold" Process we should see it in operation on covered wire before we took a chance on it.

Note: We do not agree in toto with many of Mr. Ellis' views as covered under "Discussions". Mr. Schatzel for example did not condemn the "Cold" Process so strongly. We point these things out to indicate how controversial all opinions in connection with the industry can be.

Rome Cable Co. as a Producer of A.C.S.R.—

We were quizzed at some length in connection with the manufacture of A.C.S.R. Rome Cable is going into this phase of the business. They are perhaps forced into the A.C.S.R. and aluminum conductor business due to the shortage of copper. They questioned us on the pattern of business of 7-strand versus multi-strand cable. This question of course has no good answer, and while today multi-strand may predominate, the pattern varies with changing economy. They also questioned us on performing and types of multi-strand machines. Their questions were rather general in view of the fact that they intend to call on Massena Works in the spring to get more detailed data on the manufacture of A.C.S.R. and aluminum conductors.

Covering of A.C.O.A. Products on Toll Basis by Rome Cable Co.—

Mr. E. J. Holcomb discussed with Mr. R. A. Schatzel of Rome Cable at some length, the problems in connection with Rome's covering wire and cable for A.C.O.A. on a toll basis as a temporary expedient to get us in this field of business.

It was tentatively decided that for reel shipments of the finished covered cable, we would ship the cable to Rome on a reel large enough to hold the same length of cable after covering. Rome Cable would probably have to have an extra reel of each size used in final shipment so as to eliminate the necessity of rewinding to get it on one of our reels.

In the case of covered cable to be furnished to customers in coils, we would still want to ship the cable to Rome on reels in long lengths to facilitate covering on their C.V. machines. Rome Cable would have to take care of cutting and coiling and then wrapping for shipment. We would of [fol. 4969] course have to provide labels, shipping tags, etc.

Another possible procedure which Mr. Holcomb discussed was the shipping of a length of cable on a reel which would give a covered reel length (same reel size) plus a coil length. In any case Rome Cable would want to use the same reels which we shipped the cable to them on for the final covered cable reel shipments so as to prevent the necessity of shipping empty reels around and to reduce their problem of storing such reels.

Mr. E. J. Holcomb also discussed with Mr. Schatzel the possibility of Rome Cable Co. providing compounded neoprene stock to us. Mr. Schatzel thought that this could probably be done since they have two Banbury mixers and have some excess capacity. However, he felt that we should figure on this only as a temporary arrangement. He felt that in the long run we would want to do our own mixing, since he believed that that was the only satisfactory method if we were permanently in the business.

Observations

Manufacture of Neoprene Covered Weather Resistant Cable—

The start of this operation is in the batching room where two men weigh up the various ingredients which go into a Banbury mixerful of neoprene compound. The mix which Rome uses for weather resistant covering is made from one grade of neoprene. This mix is known as #9007 having a gravity of 1.6. The cost per pound of the materials in the mix is 20¢ or 32¢ per pound volume. This does not include some 4 to 7% operating scrap or 1% inventory shrinkage lost in handling and storage of the ingredients. The men weigh up the neoprene and other solid materials and place them in batch box #1, having a capacity of about 200 lbs. The neoprene is received from DuPont in 4-ply bags on

pallets. Each bag weighs about 50 lbs. The pure neoprene [fol. 4970] itself comes in sticks or chunks about 1" square and about 10" long and is covered with a light powder, apparently to keep it from sticking.

Batch box #2 is filled with about 200 lbs. of additional ingredients, including lamp black, clay and other reinforcers or fillers. After the two batch boxes are weighed up, an additional paper bag of perhaps 10 lbs. of zinc oxide is weighed up and placed on batch box #2. The two batch boxes are then discharged by roller conveyor to an elevator which delivers them to the charging platform of the Banbury mixer.

The Banbury mixer operator on the charging platform dumps the first box of the batch containing the neoprene and other solids, etc. into the mixer with a cylinder operated dumping device and closes the ram, which shoves the material thru the hopper into the mixer cavity. The operator then starts the mixer in accordance with the instructions on his "batch card", which for example calls for a total mixing time of 16 minutes, the first 8 minutes being required to mix batch box #1 at low mixer speed with a temperature limit of perhaps 300° F. After 8 minutes of mixing the ram is raised and the second batch box is dumped into the mixer. A large cloud of dust is evolved which is fairly effectively collected by a hood over the charging hopper.

As the powder and filler from batch box #2 are being mixed into the batch at low mixer speed a charge of perhaps 5 lbs. of Circo plasticizing oil is added from a tank alongside the operator. This is done thru a drain pipe from the tank which connects directly to the mixer cavity and the amount of oil added is measured by a scale on a sight glass on the storage tank. After mixing perhaps 3 minutes in accordance with the instructions on the "batch card" the ram is raised and the hopper is carefully swept down, at which time the 10-lb. bag of zinc oxide powder is added. The ram is then closed and the mixer is operated 2 more minutes at high speed, after which the hopper is again swept down and 2 cupsful of liquid accelerator are added from the bucket on the mixer platform. The ram is again closed and the batch continues to mix for 3 minutes at high [fol. 4971] speed, at which time the batch is dumped

from the bottom of the mixer onto the sheeting rolls. The Banbury operator need not be a skilled man if he keeps awake and performs the operations as outlined on the "batch card" and as long as he watches the temperature of the mix.

The mixer is water cooled but the flow of water to the various parts of the mixer is not controlled by the mixer operator. The operator can and must carefully watch, the temperature of the mix, the time, and the load on the mixer motor. If the mixer motor load becomes excessive or the temperature climbs above that prescribed by the mix card he knows he is in trouble and promptly dumps the batch and calls the control laboratory to see what is wrong. The chief difficulty in Banbury mixing of neoprene is caused by reaching vulcanizing temperatures wherein a portion of the mix will partially vulcanize. If this occurs your entire batch is probably ruined and must be sold for a few cents a pound as scrap, or you may elect to take a chance on it and put it thru the extruder. If you are lucky you get a good finished product. If not, you may tie up the extruder for a long period of time and turn out a large amount of scrap. The Banbury mixer we saw in use was a #9 and it was not the universal spindle driven type known as the Unidrive type. They maintained, however, that maintenance had not been excessive on this unit. The unit is cooled by recirculated cooling water which is limited to a maximum of 55° F. when the mixer is used for mixing neoprene. This requires a refrigeration system which, in their plant, had a capacity of maintaining a flow of 650 gals. per minute of 55° cooling water. Their refrigeration unit was a Lummus, 4-jet, single effect steam jet unit which cost about $40,000 in 1947. This particular refrigerator would be a much larger unit than would be required for our use in the "Hot" Process.

The handling equipment for the batch boxes between the batching room and the mixer was very elaborate; perhaps much more than we would require. The Banbury mixer room was reasonably clean considering the amount of pulverized fillers and reinforcers used in the batches.

[fol. 4972] After the batch was dumped from the Banbury mixer it fell on the 84" x about 24" sheeting rolls which are very similar to a 2-high flat sheet mill laid on its

side. The rolls are driven by square gearing without the use of pinion stands and/or spindles. The teeth on the gearing are rather deep whereby one roll can be screwed in and out to vary the thickness of the sheet without unduly affecting the tooth contact of the gears. The roll on the operator's side is slightly smaller than the back roll. This causes the neoprene batch to always cling or wrap around the front roll. There are two men on the sheeting mill who continually work the 400-lb. mass of neoprene mix which is continually cut, crossed over and worked on the front roll very much like taffy candy. The labor involved here is somewhat strenuous, and it appears to the writer that the operation could be very hazardous in that the men use their arms and shoulders to roll up large sheets of compounded neoprene which they then throw back into the bite of the rolls. A horizontal safety stop bar has been provided above the rolls which a man could hit with his shoulder, arms or head if he should get tangled up. This stop bar actuates an air valve which bleeds air from a Fanwick internal expanding clutch. This special clutch has two elements, one which dis-engages the mill drive motor and the other stops the mill half of the clutch. The entire mechanism works very rapidly and the rolls stop in approximately 30° of rotation after the safety latch is operated. With this arrangement it appears that the mill is reasonably safe. At Rome Cable they claim to have had no serious accidents.

The mixing cycle on the sheeting mill no doubt gives the mix additional work over and above that which it gets in the Banbury mixer. Mr. Ellis feels very strongly that this mixing of the sheeting mill is an important part of the preparation of the material in the "Hot" Process. The men work the batch approximately 5 minutes and we are told they have considerable skill and judgment as to just how much working should be done. After the prescribed amount of work has been done, a rotary knife, along with a [fol. 4973] stripper is swung into position on one side of the front roll. This knife cuts off a 12" wide strip, which is fed thru pinch rolls to a cooling conveyor. The operators keep rolling up and throwing the rubber into the bite of the roll above the stripper as it is delivered by the stripper to the cooling conveyor.

Before the rubber is carried up into the roof trusses by

the belt of a long cooling conveyor it goes thru a bath of cooling water and a bath of water containing latex and soap solution which prevents the compounded neoprene sheet from sticking to itself. After the strip is cooled by fans blowing fresh air over the long belt conveyor the strip is returned to a flying shear near the sheeting mill where it is cut into approximately 48" lengths and is then stacked by the second sheeting mill operator onto batch pallets which have hinged shelves each side of a center panel; each shelf accommodates 3 pieces of sheet. This keeps the bearing pressure very low and prevents the material from sticking together. At this point a sample piece of compounded sheet is taken and identified and sent to the laboratory for control purposes on the batch just mixed. In the laboratory this sample is checked for plasticity after sheeting and before curing. It is also checked for specific gravity and then a sample is cured to check curing time, curing properties, etc. After being cured the sample is then tested for elasticity, tensile strength, etc. This control laboratory either condemns or passes a given batch of compounded neoprene for further application in the continuous vulcanizing extruders.

At Rome Cable they attempt to use the batches of compounded neoprene sheet within 30 days after they are prepared in the Banbury mixers and sheeting mill. When utilized for covering weather resistant cable, compounded neoprene sheet is withdrawn from stock and placed on a warming mill in batches of about 200 lbs. At the warming mill, a small amount of plasticizer is added as the material is worked. At Rome they use two men on each warming mill. The warming mill, for all we can see, is a duplicate of the sheeting mill except that it is probably not as. [fol. 4974] wide a mill. Both mills have water cooled rolls which are driven thru square gearing.

After the raw neoprene batch is worked on the warming mill and is warmed up by horsepower input in the form of work, it is removed from the left hand edge of the roll by a rotary knife and slitter, which feeds a 3" wide strip of warm compounded neoprene stock to a coiling device wherein the strip of stock weighing about 20 lbs. is coiled on a flat steel spool with one flange called a "hat". These "hats" of prepared and warmed strip are delivered to the extruders.

At Rome Cable the extruders were located in a pit or cellar. The pit at the extruder proper was open while the pit over the capstan and curing tube was floored over to convert this portion of the pit into a cellar. The "hats" of rubber were lowered into the pit by a small hydraulic elevator in an insulated box which tended to maintain the heat in the strip which was developed at the warming mill. At the extruder head the operator loaded each "hat" onto a payoff and fed the warm strip into the hopper of the extruder. "Hats" which cooled off too much according to the operator's judgment were returned to the warming mill for re-work. The feed was controlled by spiked pinch rolls driven by a ratchet mechanism from the motor driving the extruder screw. The wire being covered was payed off from a reel on a let-off at main floor level ahead of the extruder. At the edge of the extruder pit the wire was snubbed around a capstan and was held against the capstan by a pair of V-belts running on three sheaves which maintained pressure on the wire against the capstan, preventing it from slipping. The capstan shaft drives a worm gear speed increaser, the high speed shaft of which carries a brake drum. Wrapped around this brake drum was a brake band of leather which was weighted by a small weight of approximately 2 lbs. This speed increaser and small braking action provided for smooth constant back tension required in extruding. The back tension by this method is independent of the diameter of the reel from which the wire is payed off.

[fol. 4975] As the wire left the back tension capstan it went over a sheave and into the pit where it first passed thru a 2-plane roll straightener and then entered the extruder thru the back of the head. The wire was threaded thru the head of the extruder and thru the tip around which fits the die. This head applies the covering on the wire. After the covered wire leaves the extruder head it enters the curing tube. The curing tube has a telescoping section at the extruder head which can be retracted by a rack, pinion and reduction gear driven by a small motor thru a fluid coupling. The curing tube has a steam tight slip joint at this point and seals against the die head. Steam at 250 lbs. pressure is introduced to the inner curing tube thru a 3-way valve; position 1 applying steam to the curing tube, position 2 shutting off steam and exhausting tube to

atmosphere thru vent pipe thru roof of building. The curing tube itself is about 150 ft. long, the internal tube being 4" I.D. for the first 20 ft. Beyond that point the tube drops to about 3" I.D. The curing tube proper is jacketed with a larger tube about 6" I.D. which is maintained at 250-lb. steam pressure at all times and is insulated. At the exit end of the curing tube there is a rubber seal. This seal can be removed and replaced by shifting the cooling tube toward the capstan. The cooling tube is about 20 ft. long and is supplied with cooling water. It is sealed at the exit end and water pressure in the neighborhood of 200 lbs. is maintained in the cooling tube. This water pressure is secured thru the use of centrifugal pumps, using mill supply for suction. As the covered wire leaves the cooling tube it goes thru a spark stand and then to the capstan. At the capstan several wraps are taken and the wire, if large size, is then spooled on take-ups mounted on the floor in the cellar. In this set-up they have two large take-ups set up in tandem and both driven from the same motor by means of chains and clutches. If small size wires are being handled, the wire is returned to the front end of the machine where it is taken up on dual reel take-ups next to the pay-[fol. 4976] offs. In the case of large wires it is not practical to lead the wire clear back to the starting end of the machine as the tension required would be excessive and the wire would be subject to vibration and whipping when going thru the curing tube. Rome has dual payoffs for each extruder and with the dual take-ups they are able to operate their extruders continuously except for shutdowns for change of size, change of seals, week-ends, etc. The following points in connection with extruding neoprene covering on weather resistant wire and cable were made by Rome Cable Co.—

1. In general, stranded wire which is to be covered should be made up of small size individual wires. This gives better concentricity of cover, prevents ridging action which would occur using larger size wires and eliminates voids which might not be filled with covering, this being objectionable on insulated cable, particularly on lines where high voltage and ionization is involved. In the case of

weather resistant cable these ridges are objectionable from an appearance standpoint.

2. Sizes larger than 1/0 or 2/0—7-strand cable are not suitable for extruded covering. They should be made up of more than 7 strand for satisfactory covering.
3. A 4½" continuous vulcanizing machine is suitable for sizes up to about 500,000 C.M.
4. It should be remembered that the scrap loss running a continuous vulcanizing machine is a minimum of 400 ft. per change of size plus 400 ft. every time a curing tube seal is replaced, which is on the average of every 12 hours. Therefore, it is absolutely essential to operate a C.V. machine continuously as long as possible.
5. Rome Cable saw no advantage of a stainless steel tube for the first 20 ft. of the curing tube. They point out good operation would require tension which would keep cable from touching tube in this region.
6. Whether or not the curing tube slopes down or is level is somewhat controversial. Rome used a 4" I.D. tube for the first 20 ft. and a 3" tube and offset reducer keeping the bottoms of the tubes aligned for the remainder of the curing tube.
7. Steam required per C.V. machine is approximately 200 to 250 lbs. per hour at 250-lb. gauge.

[fol. 4977] 8. 4½" machines are satisfactory for the range of sizes we intend to produce in weather resistant as well as Triplex cable. However, different lead screws would be required for the large and small range of size.

9. Weather resistant wire should be run in longest length available to reduce stringing up difficulties.
10. Weather resistant wire must be respooled and repaired if there are more than 3 spark breakdowns per 1,000 ft. or if there are any spark breakdowns of long duration indicating a bare section of wire.
11. If weather resistant wire and cable is to be sold in coils or short lengths, the coils should be made up as a separate operation, not on a C.V. machine.

To operate a C.V. machine, one operator is required, who must stay at the head of the machine at all times. There must be another man at the take-up end of the machine when running large sizes. If you have a bank of machines running large and small sizes the number of men at the take-up end perhaps can be reduced.

The respooling and repair set-up for cable should be near the C.V. machines and there must be the utmost co-operation between these groups as all the repair and re-spooler men, as well as truck drivers, must pitch in to make a continuous switch of a big cable. We observed a large cable of about 375,000 C.M. being covered on a C.V. machine. This operation requires 2 men to unspool the almost empty reel of bare cable to gain enough slack to make a weld or an attachment of whatever type is required. These same two men saw off ends of cable square and make and file weld while a third man on a platform truck with a horizontal sheave on the platform runs up the aisle of the mill with a loop and enough slack to allow time to make the weld to the new reel. At this weld enters the head of the C.V. machine the operator strikes the bare cable about 3 sharp blows in rapid succession and this causes blobs of excess material to form in the covering which the take-up helpers follow down to the reel and then make a switch to a new empty reel on the fly. We did not see this operation but feel sure that 2 or 3 men would be required to make the switch from one take-up to the other. [fol. 4978] The operator at the extruder head end of the machine controls the relative speed of the screw with respect to the capstan which pulls the wire or cable thru the machine. The motor on the screw and capstan are controlled by V.S. drive unit, the details of which were discussed with Rome Cable Co.'s electrical engineer by our Mr. Plummer. The take-ups of the C.V. machines are driven from the capstan shafts by a chain drive and a type 1000 DoAll 9-speed change gear box with friction clutch to compensate for many sizes of take-up reels.

At Rome Cable a special vulcanizing press is provided for making seals for the vulcanizing and water tubes of the C.V. machines. We did not see this operation.

After the reels of covered wire or cable are removed from the take-up the weather resistant wire is coiled in measured

length, at which time repairs are made by use of neoprene tape and a small electrically heated vulcanizing press.

If the wire is to be shipped on reels and if not more than 3 spark breakdowns per 1,000 ft. and none of these of enough duration to indicate a bare uncovered wire are recorded at the C.V. machine, respooling is not required and the wire can be shipped on the same reel.

Manufacture of Neoprene Covered Triplex Service Wire—

Triplex service drop cable is a 3-conductor cable used by the Utilities to connect from the power line at the pole to a residence. There are generally two 7-strand neoprene covered aluminum conductors, each of which carries 220 A.C. current. These two covered conductors are loosely stranded around one aluminum core wire which is the neutral or ground wire. This neutral or ground wire is bare. The potential between the neutral and covered wires is 110-volt A.C.

The operation of the C.V. machines and the preparation of the mix for making Triplex is essentially the same as for neoprene covered weather resistant cable just described. The mix used normally at Rome Cable is their #9001 having a gravity of 1.97. The cost per pound of the materials in this mix is 21¢ or 41¢ per pound volume. This [fol. 4979] does not include 4 to 7% operating scrap or 1% inventory shrinkage. The material is mixed in the Banbury, sheeted, stored, warmed and fed to the C.V. machine in exactly the same manner as for making neoprene covered weather resistant cable. The only difference is that the number of allowable insulation breakdowns indicated at the C.V. machine is limited to zero due to the fact that Triplex is an insulated cable. The individual covered conductors are taken up at the C.V. machine on large reels, are then respooled on about 30" reels, at which time the cable is repaired if any insulation breakdowns occur at the spark stand.

Two of these 30" reels are then delivered to a homemade stranding machine wherein the two reels are rotated about the third bare neutral strand of aluminum cable. The axis of the spool is parallel to the longitudinal center line of the strander head. The head is basically a rigid frame

machine except that the spool spindles are not cantilevered but are supported by arms on each side of the spool. The machine head was designed for 100 R.P.M. but was running only 75 R.P.M. and showed a lot of heavy vibration from unbalance of the two spools. The machine looked very crude and unsafe to us. In view of the fact that individual strands of covered wire are generally multi-strand rather than solid conductors we are of the opinion that this Triplex cable would look much better if it were stranded on a planetary machine wherein the individual strands were not twisted or untwisted as the Triplex was stranded.

The capstan, take-up and other parts of this machine were conventional. Apparently all the Triplex made at Rome was sold on reels as we did not see any respooling operation.

After the reels are taken off the stranding machine they must be subjected to a 2,000-volt insulation breakdown test while the whole reel is submerged in water. This set-up involves a basket or rack which takes several reels of cable which can be lowered by chain falls into a water tank. The ends of each piece of Triplex on the reel extend above the water and are clamped to a high voltage bus for the test. [fol. 4980] The entire area above the tank where these connections are made is screened in by expanded metal panels as a safety measure. If the Triplex cable passes this test without insulation breakdown, the reel can be shipped. If not, the cable must be returned to the repair center for repairs and then must be tested again before shipment.

Rome Cable normally uses their #9001 neoprene mix, which incidentally requires two grades of neoprene, for Triplex wire. However, some Utilities specify a combination extruded cover using some neoprene and some natural rubber. This varying specification on Triplex cover might cause us much difficulty when we are in the Triplex business.

Manufacture of Thermo-Plastic Covered Wire and Cable—

The Rome Cable Co. does a considerable amount of extruding of thermo-plastic covers on wire and cable. They use polyethylene, polyvinle chloride, etc. for this. However, the amount of polyethylene they are extruding on

wire and cable for a weather resistant covering has been limited because of the unavailability of polyethylene for this use. They took us thru their new 2-story mill building in which they make a product known as "Spiral 4", which is described briefly in another part of this memorandum. In this building they had all new machines, including a number of new Davis Standard Machinery Co. thermo-plastic extruders. These extruders appeared to be well designed and well built machines and were complete with double payoffs, accumulators at both the payoff and take-up ends, double V-groove capstan, and double take-up, all furnished by Davis Standard. The double payoffs and take-ups with the accumulators permitted continuous operation which is undoubtedly the most efficient manner of operating these machines, although it is not as essential as with neoprene C.V. machines.

The Davis Standard thermo-plastic extruder was equipped with a large hopper with conical bottom and this hopper was filled by means of small chain type conveyor [fol. 4981] from a hopper on the floor into which the polyethylene pellets were dumped by hand. The operator controlled the pellet conveyor by a push button and would shut it off when he could see from the floor that the upper hopper over the extruder was full. The extruder cylinder was equipped with three heating zones. The temperature of these zones were individually and automatically controlled by a Wheelco temperature control panel. Each of the three zones of the extruder had a cast aluminum jacket in which water cooling tubes and Calrod heating units had been cast in. Water flow thru each jacket was manually controlled by valves so that enough cooling was provided so that the automatic temperature control could maintain a given temperature by always adding some heat by means of the Calrod units. The extruding head appeared to be of very good design and was hinged to the extruder cylinder and could be opened or closed by use of a single unit. The head was carefully machined and appeared to be easy to clean. The head was electrically heated.

The covered conductor entered a water cooling trough right after leaving the extruder. There was a gap of about 1 ft. from the extruder head to the cooling trough. The cooling trough was approximately 30 ft. long and the wire im-

mediately went onto a double groove capstan from the cooling trough. The wire was then threaded around a combination accumulator and dancer roll arrangement which was a horizontal unit mounted over the cooling trough. The combination accumulator, dancer roll unit controlled a rheostat which controlled the speed of the double take-up unit.

The double take-up unit was set up in tandem with the extruder, cooling trough and capstan. The wire went directly from the combination accumulator, dancer roll unit to the dual take-up in which the two reel spindles were mounted in tandem. Each reel was driven by an individual electric motor and when one reel was filled the operator would stop that reel and cut the wire and attach it to the drum of the second reel and then start the second reel motor. In the meantime the cable put out by the extruder [fol. 4982] would be taken up on the accumulator and once the second reel was started the dancer roll part of the accumulator functioned to speed up the take-up and bring the accumulator back to its normal position.

At the payoff end the accumulator was a vertical unit and served to allow the extruder to continue to operate by serving wire to the extruder and maintaining back tension in the wire while shifting from one payoff to the other. The two payoffs were side by side and when the tail end of the wire came off from one reel one man merely grabbed the end and stopped it while another man hooked the end to the beginning end of the wire on the other reel. They had some special hooks to facilitate this which had previously been attached to the ends by crimping them on. After the two ends had been hooked together the men released the wire and the accumulator moved back to its original position of fully extended. The reason that this accumulator moved to its fully extended position for normal running was because the counterweight which produced back tension in the wire produced a slightly higher tension than that provided by the brake on the payoff. The payoffs were equipped with brakes actuated by a dancer roll to maintain uniform tension.

Altogether, it was evident that the operating of a thermoplastic extruder was considerably simpler and more flexible than the operation of a neoprene C.V. extruder. A thermo-

plastic extruder could be operated on a one shift basis according to the Rome Cable men. They stated that you could stop a thermo-plastic machine and leave the polyethylene in the extruder with low heat applied for a couple of days without and serious trouble. They also stated that it was about a 2-hour job to clean out an extruder.

The Rome Cable people recommended a 4½" dia. cylinder as the correct size extruder for the range of wire and cable sizes which we are planning to cover. They thought this was the correct size extruder for us for both polyethylene and neoprene. One point to remember is that the [fol. 4983] speed of extrusion for neoprene compounds depends mostly on the length of the curing tube and the thickness of the covering, whereas with polyethylene the capacity of the extruder is the influencing factor. In general this would mean higher extrusion speeds for polyethylene for a given size of extruder. The Rome people seemed to feel that in operation of an extruder you should stay below 85 to 90% of the extruder capacity.

Some other points brought out in our observations and discussions in connection with thermo-plastic coverings at Rome Cable Co. were as follows—

1. They would recommend the use of double grooved type capstans for polyethylene extruders as well as for neoprene C.V. machines.
2. Price of natural polyethylene —52¢ per lb. Price of precompounded black polyethylene—55¢ per lb.
   The above are quantity prices. By purchasing precompounded black polyethylene you can eliminate the need of purchasing an integrating sphere photometer for laboratory testing of carbon black dispersion called for by A.S.T.M. specifications.
3. Amount of cooling water on polythylene extruders small, probably a total of only 2 gals. per minute for cylinder and screw cooling. They did not estimate the water for the cooling trough but it was noted that a 1" O.D. copper tube supplied all the water for cooling trough, cylinder and screw cooling.
4. They thought that we could use the same screw for all of our polyethylene extrusion work. Using a

4½" machine, a shallower screw might be necessary on the very smallest wires.

5. They pointed out that the size of wires in the outside layer of a cable to be covered by either polyethylene or neoprene must be limited or you might run into trouble in getting a round uniform cover.

6. When they were extruding a polyethylene cover on a single wire (not a jacket) they used a spark testing unit ahead of the capstan the same as on a neoprene extruder. This spark tester recorded on a counter the number of faults in a length of wire and cable. Any length of wire which had too many faults in the cover would be sent to a repair area the same as with a neoprene cover. When faults were found with the spark tester on this rewind-repair set-up, the damage can be repaired with a Minnesota Mining & Mfg. Co. tape #300. A Muff vulcanizing press is used for this and heat is applied in the dies of the press to melt the patching tape and form it.

[fol. 4984] 7. Rome Cable Co. in some of their operations extrude polyethylene covers on two wires at the same time in one extruder. This is done only with very small wires and they stated that on the size of wires which we are contemplating to cover, it would not be feasible to cover more than one at a time.

When they did this double extruding of wires on one extruder, they doubled up on practically everything else, that is, 4 payoffs, 2 accumulators on payoff end, 2 combination accumulator and dancer roll units, and 4 take-ups. The capstan unit served for both wires but had separate grooves in the capstan bull wheels for each wire.

8. The operator on a polyethylene extruder checks the O.D. of the covering of the cable he is producing with ordinary micrometers. Regulation of the speed of the screw or the speed of the cable controls the vernier adjustment of the O.D. of the finished covering. The operator on the extruder carries micrometers and checks the O.D. of his finished cable coming off at frequent intervals. This is also true in the case of the operator on a neoprene extruder.

Manufacture of Cotton Impregnated Type of Weather Resistant Cable—

The Rome Cable Co. people advised us that cotton impregnated type of coverings for weather resistant covered cables still consituted approximately 80% of the total volume for the industry as a whole. They also stated that with the Rome Cable Co. the percentage even ran a little higher.

In our trip thru the Rome Cable Co.'s mill, we saw them putting on cotton type coverings using both braiding machines and knitting machines. Their braiding equipment consisted of both maypole type braiders and Wardwell type braiders. They had a very large number of braiders. For operating efficiency they had braiders arranged in two parallel lines, face to face, perhaps 10 to 12 or more per line, with an operating platform (3 ft. high) between the lines. Some of their maypole type braiders were apparently quite old machines and very slow. The operations of their braiders appeared to be the same as what we do or have done at Massena. The put on both double and triple braid coverings.

[fol. 4985] The knitting machines which we saw at Rome were the "Sinfra" type machines manufactured by the Fidelity Machine Co. These machines cover at speeds about 2 to 3 times as fast as a braider. The cover is knitted on by a group of special needles which are actuated by a cam. Their machines were all arranged with three heads for triple coverings, and they advised that with knitted covers they always put on a triple layer cover to insure satisfactory covering.

These "Sinfra" knitting machines are a much simpler machine than a braiding machine. About the only moving parts are the needles and operating cams and these parts require the major part of the maintenance on these machines. The needles have to be replaced at frequent intervals but even so the maintenance on these machines is less than on a braider. There is a good deal of fuzz, from the cotton threads, covering these machines and the area and this of course constitutes a fire hazard, but we have this same condition to a certain extent on our braiding machines. The yarn supply is on large cops or cones placed on support

spindles on the back side of the machines. The individual yarns are fed from their respective cops up thru an automatic tensioning and stop motion device on an overhead rack and then down to the knitting heads. If a yarn breaks, the stop motion device shuts down the machine.

The "Sinfra" machines are equipped with a small straightening head at the entry end for straightening the wire as it enters the machine. However, Rome Cable did not appear to be using this device on any of their machines. They did pass the wire or cable thru the straightener, but the rolls in the straightener were not adjusted to do any straightening. These machines were equipped with a 36" single flat capstan and about a 40" reel take-up unit driven from the main machine. These "Sinfra" machines were equipped with individual saturating tanks for impregnating the knitted cover so the impregnating could be done at the same time that the covering was knitted on and this saved an additional operation. The "Sinfra" type knitting machine lends itself to this additional operation since they are a horizontal type of machine instead of vertical like a braider. [fol. 4986] Since the speed of cable even from a knitting machine is relatively slow (about 25 ft./min.), few wraps around the drum in the saturating tank are required.

The Rome Cable people pointed out that they did not always use the individual saturating tanks on these machines since it was sometimes more economical for them to impregnate in their large impregnating set-up when they were operating these large units and had the capacity available there. All the braided covers were impregnated in the large separate saturating tanks.

The saturating tanks for putting on the asphaltic impregnating compounds as a separate operation appeared to be conventional. At one location which they showed us, they had 2 saturating tanks, side by side, in an old wood truss building and in this set-up they had their payoffs and saturating tanks in this old wood truss building and then the wire or cable was passed thru doorways in a brick wall onto the take-ups in the adjoining building. The saturating tanks were open with an exhaust hood over them. The saturating tanks had a large driven drum nearly submerged in the asphalt compound and they were taking many wraps around this drum to secure maximum saturation. The cable was

taken up on metal reels, about 36" dia., on the take-up units.

The next operation was the wax covering of this impregnated cable. The metal reels were set up in a payoff frame and the cable was first passed thru a wax covering unit. This unit consisted of a tank heated by steam in which the wax material was melted. They were using a Styrene pitch material loaded with filler (such as slate dust) and they obtained this material all compounded from sources such as Trotter, Solar, and H. H. Robertson. They pointed out that since this cable was sold on a weight basis, it was desirable to use a maximum amount of wax filler as allowed by A.S.A. specifications. This wax tank had a conical bottom and was fitted with a tee head at the bottom thru which the covered wire or cable passed. This tee head was [fol. 4987] fitted with entry and exit guide bushings or dies to prevent leakage of the wax compound, and to provide a uniform coating. A small Bunsen gas burner was used at the bottom of this tee head apparently to keep the head warm enough to prevent any setting up of the wax compound within the head. Without cooling the wax covering, the cable was then passed thru a heated mica dusting unit. This mica dusting unit was equipped with a blower which stirred up the mica dust to give the cable a good uniform coating as it passed thru the chamber of the unit. We believe that the air was heated and a cyclone separator was employed to separate the mica dust from the exhaust air leaving the chamber. It is probable that this mica duster was a purchased unit. There appeared to be much less waste of the mica powders compared to our method of application. The wire or cable was then passed thru a water cooling tank over a capstan and onto a reel.

Rome Cable advised us that this product was sold both on reels and in coils. The coils were approximately 19" I.D.

General Observations

During our inspection trip, in addition to the manufacture of weather resistant and Triplex wire and cable, we observed other operations as follows—

Copper Rod Mill—

This mill was rolling 5/16" copper rods from about 4" x 4" x 60" copper wire bar. They utilize 2 pusher type oil fired preheat furnaces which discharged onto a driven table which fed a 3-high breakdown stand individually driven, where the bar received 2 passes—there were two more 2-high breakdown stands where the bar received 2 additional passes. Then on Belgian train mills the bar received an additional 11 passes, or a total of 15. After pass 4 the rod was repeated and caught by hand alternately. The looping table and runout table sloped rather steeply and not many roller guides were used. There were 4 coilers on the mill and it was delivering rod at about 1400 F.P.M. [fol. 4988] (my guess—JCG). There were 2 strands in the mill after about pass 8. There were about 9 men on the mill. The mill was old and very compact. They changed rolls by monorail. There was no crane in the building. The mill was a single purpose rod mill with many toggled up labor saving devices to make it a semi-automatic mill. They had 2 men tying coils when they were in a horizontal position after being kicked out of the coilers. This looked dangerous, if they had a coiler cobble the men would have to jump. However, the coiler speed was only about 1400 F.P.M. After being loosely tied, the coils were automatically up-ended and hung on hooks of an overhead continuous hook conveyor. This conveyor took the coils thru a sulphuric acid dip which removed scale and produced a bright coil. The dip produced copper sulphate which in a recovery process was reduced to electrolytic copper. This same recovery unit was used to copper plate all the steel spools used in the wire drawing processes. After the coils came from the pickling tank they were inspected. Ends were cut off and a third tie was applied. Then, all 3 ties on each coil were snugged up with a speed wrench with a hook on the end. Such a device might have an application at Massena. Coils were stocked or stacked and delivered to

the continuous rod drawing machines, similar to our Vaughn and Waterbury machines in Bldg. 1 except that they were probably 15" capstan machines. They were Vaughn and Syncro machines.

They were effectively using the overhead type payoffs which we have tried out here and which we understand Vancouver is using. They had one difference—the flat conveyor to deliver coils from the pinload in a horizontal position was a driven slat conveyor and was operated by the welder. A man still seemed to stay right at the payoff to prevent trouble. See page 8 of Rome Cable Co. publication "Bare and Weatherproof Wire and Cable."

Labor Situation—

Rome Cable Co. has no Union in their plant. Labor relations seemed to be excellent and there seemed to be a lot of flexibility in the types of work expected from each man. [fol. 4989] There seemed to be a good spirit of cooperation between employees. The company, as pointed out by Mr. Ellis, spends a lot of time, money and effort keeping such relations. They have many social services such as complete annual medical examinations, etc. for every employee. Rome Cable Co. has no trouble getting the better class of labor as the men are always ready to leave General Cable and Revere to work for Rome Cable—this was Mr. Ellis' opinion.

Laboratories—

The Rome Cable Co. has quite extensive laboratories for the control and testing of the various products which they make.

On a brief trip through their laboratories we saw oxygen bomb aging equipment, accelerated ozone aging set-up, various high voltage insulation testing set-ups including immersion tests, etc. In another part of their laboratory they made tensile tests, plasticity tests, and performed experimental work in developing coverings. They had a small extruder, a small Banbury mixer, small working rolls, etc. which could be used as a pilot plant set-up or in developing new compounds.

In their laboratory they also had set up a striping ma-

chine where they were putting a special stripe on plastic covered wire with a special dye or ink. After passing through the marking pen the stripe was carried up vertically in a circular stairway first past heat lamps and then up and over a sheave on the second floor landing and returned back down to complete the drying before spooling. The speed in feet per minute appeared to be fairly high, maybe 1000 ft. per minute. They stated that it was an experimental project as yet but they were actually operating on somewhat of a production basis.

Although much of the equipment in their laboratory at Rome Cable is required because of their insulating business, it appears that the following items would be needed in the weather resistant coverings—

[fol. 4990] 1. Tensile testing—they use a Scott testing machine which has a testing speed up to 20" per minute and which is much faster than anything we have in our laboratory at Massena. Their Scott tester had special jaws. We would need a similar machine for this since the speed of our present machines make them impractical.

2. Oxygen pressure aging test equipment. This is necessary to check specifications on neoprene cover. Rome recommended this equipment in place of air pressure aging which requires a longer time interval test.

3. Plastometer test—Rome Cable was using a plastometer test unit made by Firestone for a rapid qualitative test for control of the mix. In the laboratory Rome Cable also used a Scott tester for plasticity test. This is a quantitative type of test used as final tests to check specification requirements of finished product.

4. Size checks (O.D. of covering) are made by inspectors in mill using micrometers. However, the use of micrometers for this check of specifications requires considerable technique to obtain consistent and reliable readings. This check is required on both neoprene and polyethylene.

"Spiral 4" Signal Corps Wire—

Rome Cable Co. has a contract with the U.S. Government to manufacture the product known as "Spiral 4". This is a special telephone or communications cable which can be laid from a plane and can be laid over land or water. This "Spiral 4" consists of 4 polyethylene covered wires around a polyethylene core and enclosed in a polyethylene (black) jacket.

Rome Cable Co. built a new modern 2-story mill building for the manufacture of this "Spiral 4". They are allowed a 5-year write-off of this building and all the machines in the building are Government owned.

The manufacture of this "Spiral 4" requires the drawing of fine copper wire which is stranded into a small 6/1 cable. They have a large number of small (16" tube) high speed tubular stranders manufactured by Syncro Machine Co. on which they do this stranding. These small cables then have a polyethylene cover extruded on and one Davis Standard extruder does this to 2 of these cables at the same time. The have several machines doing this.

[fol. 4991] Other operations in this mill include the extruding of a polyethylene core and then the stranding of 4 of the polyethylene covered cables about this polyethylene core. The next step in the manufacture of this spiral cable is the extruding of a polyethylene jacket around the stranded cable. They have 4 Davis Standard extruders for this purpose. The final step in the production of this cable is the installation of special terminals or connectors to each end of each length of cable. These connectors have to be water tight and there are several steps in the installation of these connectors.

They have an elaborate set-up of test equipment and each length of cable produced must be tested thoroughly. Many different types of tests are made.

This "Spiral 4" product is finally made ready for delivery on special metal reels with special heads for the connectors.

Pan Vulcanizing and Lead Sheathing—

The Rome Cable Co. was also doing a large amount of pan curing of their insulating rubber covers. In this pan

method of curing the cover, as the cable left the extruder where the compound was put on, it was coiled onto a large pan (about 15 ft. dia.) in a soapstone powder to prevent the coils from sticking together. The pan was later moved to another location where it was covered with a large hood or oven and steam applied to cure the compound under pressure for a prescribed time cycle.

On the very large cable, they extrude a lead sheath on the cable over the insulating compound and then the cable is coiled onto a pan in a soapstone powder for "pan vulanizing" of the compound. In some cases, they reeled the lead sheathed cable up on large metal reels (very wide traverse) which were placed in a special steam oven for curing. After curing in the pan vulcanizing oven, or on reels in the steam oven, the cable is payed off thru a machine for [fol. 4992] removing the lead sheath and wound up on a reel. This unit, which removes the lead sheath, has two rotary slitting knives which cut the lead sheath on opposite sides of the cable and then the lead is pulled off by rolls with serrations on top and bottom of the cable. These serrated rolls are driven and above the top and below the bottom roll is an idler roll with ridges on its face which cuts the lead off or nearly off so that is breaks apart and falls into a container in short pieces. It is probable that this lead stripping machine was a purchased item and not Rome Cable Co.'s own design.

Conclusions

After collecting our thoughts and data secured at Rome Cable Co. we, at Massena, find we must change our thinking somewhat in connection with the manufacture of weather resistant and Triplex wire and cable. We believe this change in thinking agrees generally with Mr. Knouse's and Mr. Plummer's views. Our conclusions as of now are as follows—

1. The manufacture of these products is actually much more complicated than we had anticipated.
2. More technical control is required than we thought. One good rubber chemist will be required full time.
3. More elaborate laboratory and control equipment will be required than was originally planned.

4. We should not commit ourselves to the "Hot" or "Cold" neoprene process until we know much more about the "Cold" Process.
5. We should definitely buy a Banbury mixer and be prepared to mix our own compounds. Mr. Schatzel did indicate that we could probably call on them as a temporary supplier of sheeted compound if necessary in getting into production.
6. Decisions on extruders versus sheeting and warming mills must be held up pending further study of "Cold" Process.

[fol. 4993] 7. We should make a strong effort in our advertising and sales program to keep our covered wire products limited to the simple ones; viz., weather resistant and Triplex for the initial period at least.

8. We should be considering the purchase and operation of "Sinfra" knitters for making cotton covered weather resistant cable if we are to believe that 80% of the business is in cotton covered wire and cable and will remain so. Kindly refer to Rome Cable Co. bulletin (attached to Mr. M. E. Noyes copy) which devotes many pages to weatherproof wire and cable, giving a good deal of specifications for cotton covering, but devotes only one small paragraph on page 25 to extruded coverings.
9. We should study revisions to our process of making braided weather resistant cable toward incorporating certain practices employed at Rome Cable such as the use of loaded wax and heated mica dust application.
10. From our observations at Rome we lean toward Davis Manufacturing Co. as being the more progressive manufacturer of C.V. and polyethylene extruders. However, this opinion is subject to change as we saw no modern Royle machines at Rome.
11. We should inquire more specifically into priorities required to get this type of equipment. Mr. Ellis, in contrast to information from suppliers, feels that N.P.A. will be reluctant to authorize expan-

sion in this field as the copper industry still has surplus capacity.

12. An extensive cable repair and respooling center must be provided as perhaps 90% of our finished production will have to funnel thru this center.
13. The C.V. covering department must operate on a 3-shift basis and will require considerable backlogs of cable and raw material as well as warehousing of finished products and careful planning so as to secure long uninterrupted runs.
14. Of all phases of the business the neoprene covering is by far the most difficult to pursue and if in any possible way we could limit our products to polyethylenes we would be in a much more favorable position. (We doubt that such a limitation is even a remote possibility at this time).
15. With additional facilities required such as refrigeration equipment, respooling, insulation repair, water submergence test for Triplex, process control laboratory, etc., which were not originally contemplated, we feel present estimates of the cost of the project are too low and that the area available in Bldg. 56 will be much more congested than original floor plan studies indicate.

[fol. 4994] 16. A definite problem of removing and salvaging aluminum wire from neoprene covered scrap exists. We are doing some experimental work on this problem now and hope that we may be able to remove neoprene economically by charring and then tumbling the scrap.

17. Operating personnel other than technical control people, in our opinion, do not have to be highly skilled. We believe we would have little trouble filling the hourly rated jobs in such a department.
18. In the organization and supervision of an operation of this type it is essential that there be a very fluid crew of labor on material handling operations and respooling and cable repair work who can rapidly drop their assigned work and pitch in to help make rather complicated flying changes from reel to reel at the C.V. machines.
19. From information secured at Rome Cable Co. ap-

parently physical properties of aluminum wire and cable will not suffer as much from tension and temperature in the neoprene vulcanizing process as we had originally expected.

Properties of A.W.G. #4 solid aluminum neoprene covered as tested at Rome are—

	P.S.I. Tensile	*Elongation—%*
Minimum	22,075	1.25
Maximum	23,050	2.18
Average	22,650	1.77

and for A.W.G. #4—7 strand .07772" neoprene covered—

Minimum	24,850	1.8
Maximum	27,800	1.9
Average	26,188	1.85

We do not definitely know, but we think that the aluminum before covering was EC-H19. This data from Rome is very incomplete and does not indicate whether the covering operation has any effect on the size of the wire being covered or not. When we are giving Rome Cable some toll covering work we will then be in a position to completely check properties and diameters before and after covering and vulcanizing.

20. In general, multi-strand conductors which are to be covered by extrusion should be made with a larger number of conductors than is our practice with A.C.S.R. This is desirable to insure a concentric covering without spiral ridging and voids, which detract from the appearance of the finished cable. Sizes larger than 1/0 or 2/0 should be made of more than 7 strands to insure satisfactory covering.

[fol. 4995] 21. We feel that Massena Works should subscribe to certain technical publications devoted to the rubber industry and also to the complete series of A.S.T.M. specifications. We are taking steps to do this.

22. We got the impression that the insulated wire business is a highly competitive one and practically all the insulated wire manufacturers already offer weather resistant covered wire and cable.

23. The mixing, extruding and handling of neoprene is very critical. The raw mixes are very heat sensitive and if any portion of the mix reaches the curing temperture prior to its entering the C.V. machine curing tube it is scrap and cannot be reclaimed.
24. The original manpower estimates upon which Mr. Kerry based his production costs should be reviewed. Additional men are required for technical control, respooling and cable repair, warming mill operations (if we should go to the "Hot" Process), testing crew for submergence test of Triplex, etc. We also may need 2 or 3 maintenance men per shift to keep such a department operating on a 15,000,000-lb per year basis.

Our final conclusions are that even though the profit in this phase of the insulated wire business looks promising, we should not be too optimistic; there are many unknowns, pitfalls and techniques and problems not yet apparent.

Mr. Kerry's estimates of Feb. 8 and Feb. 19, 1952 of profit on such an operation we now feel should be reviewed in the light of additional technical control and manufacturing facilities required, possible scrap losses and changes in manpower—Items 2, 3, 12, 15, 23 and 24 above.

We believe that with an installation of proper equipment at Massena Works we can operate a profit making unit. However, we do not wish to leave the impression with Top Management that we can show a profit the first few months of operation, as there is much to lean thru experience.

PLAINTIFF'S EXHIBIT 72

Mr. H. T. Dyett,
Hobe Sound, Florida

16 February 1952

Dear Bert;

It was nice to talk with you on the phone from New York. I have just finished dictating this report and probably may not review it before it reaches you. If so, please overlook any inaccuracies that may have perchance crept in. This may be more detailed than you would prefer to have it but it was such an important conference, or at least so I appraised it, that I thought a convenient record for Ross might be of help, even though much of the matter contained in it leads to the same conclusion.

We will drop you and Edith a card from Jamaica and have only just learned over the phone from someone who has returned this week that where we are going is a particularly lovely spot. We will be with our old friends from Bermuda and it should be a quiet, pleasant time.

It appears that the Properzi equipment will be installed at Davenport in time for an inspection shortly after I return. This news was received by Charlie Ellis this week. All the information that comes to hand leads to the inescapable conclusion that whereas copper producers are perhaps alarmed at the unfavorable publicity directed toward lack of copper and therefore will take every step to increase supply, nevertheless the aluminum situation will continue to improve much more rapidly and that it is only a question of reasonable time before there will be ample aluminum from the three billion pound capacity program.

This has been accelerated by the severe cutback to the aviation program, therefore releasing capacity in the next few months to other needs. It seems generally agreed that the aircraft companies have piled up their inventories with the help of Wright Field and perhaps are also guilty of over-ticketing in order to protect themselves. If so, with a cutback this should be shaken out and should be apparent, unless some new factors enter into the situation not now foreseen. As Ross may tell you, the Steel Corporation in-

dicated at the Kroger dinner this week that steel may be in over-supply during 1952, stating that "these were straws in the wind but that they were substantial straws."

With best regards, J. Carlton Ward, Jr.

Farmington, Conn.

16 February 1952.

Memorandum regarding visit of Alcoa representatives to Rome, N. Y. 13, 14 February, 1952.

The following three gentlemen represented the Massena plant—

Mr. Edward Holcomb, Mr. William Wheeler, Mr. James Glascock—

and in addition there were two engineering representatives from the main office in Pittsburgh, namely—Mr. Dale Knousse and Mr. R. W. Plummer.

From a general discussion held immediately after their arrival, it seemed clear that all of these gentlemen were arriving under instructions that they were to get as much technical and manufacturing information as possible relative to Neoprene and Polyethylene types of weatherproof wires. At the beginning of the meeting their questions were more of a general nature and reflected the fact that they had had previous meetings with the Royle and Hall extruder people as well as with the DuPont representatives. In the course of the discussion they asked a number of questions about rates of production and subsequently they produced a memorandum worked up from their conversations with the machine manufacturers. On the whole their figures were surprisingly good although in general slightly below the Rome figures. These figures were for extrusion speeds only.

Naturally they were interested to know what sizes of wire they should be ready to manufacture and during the two days they produced some make-up tables for their ACSR cables which they felt they would have to insulate. These tables showed some unusual stranding lays due to the

manner in which their customers juggle the steel core in order to get the necessary tensile characteristics for their special tower spacing. In general, they realized they would have to make from #6 through the larger C.M. sizes. They wished to know if 1,000,000 C.M. would go through the C.V. machine and if not, up to what size they could count on for a 4½" worm feed machine. Shallow vs. deep groove worms were discussed and particularly in relation to the sequence of operations from the Banbury mix to the C.V. machine. They had been told that they could do away with the warming rolls by substituting a worm-fed strainer in accordance with Western Electric practice. Charlie and Rudy made it clear this could be done but that they did not feel Western Electric's production compared favorably with that at Rome Cable and that Rome would prefer their present practice of using warm-up rolls.

It was clear that the Alcoa representatives did not have much information or knowledge on the insulating compounds and had naively assumed that one Neoprene compound would serve their needs. This point was cleared up when they were taken through the factory and were allowed to witness the operation of a Banbury machine and examine the number of batch cards in the rack, together with Rudy's explanation as to the reasons for their being more than one Neoprene compound and that different customers also utilized different constructions. For instance, a soft compound was suitable for a single conductor but a hard compound was necessary for 3 wire combinations in order to resist deformation after twisting and under load. This had a disheartening effect and their illusions regarding manufacturing simplicity were being rapidly dispelled. In sub- [fol. 4998] sequent conversations on the following day the question of entrance cable and service drop wires was thoroughly presented and it was pointed out to them that from the utility's point of view, the arguments brought to bear upon their sales representatives for them to get into weatherproof if they were to receive favorable consideration with their ACSR line was also going to be brought to bear after they were in weatherproof production in connection with other utility requirements, largely in the insulated field, and that service entrance and drop wire was a "twilight zone!" They were shown that Public Service of New

Jersey would require an underlying rubber insulation before the Neoprene was applied and this apparently disturbed them considerably. They were heard to remark from time to time that it was clear to them that the Rome representatives did not believe they could get into weatherproof wire without shortly thereafter being pressured to get into other lines, with the result that they would be in the insulated wire and cable business before they got through.

Mr. Holcomb, the Assistant Manager of Massena, remarked to me when I took him home on Wednesday night after they had made their decision to stay over another day, that their plan to go into weatherproof seemed as though they might get into a very complex business, ending by manufacturing what he called "end products." This he stated had not in the past been Alcoa's policy. It was clear that Kaiser's aggressiveness was driving them into consideration of this problem, particularly for the weatherproof field.

To conclude this line of thought, their subsequent thinking on Thursday was that it would be nice if they could avoid Neoprene and merely manufacture Polyethylene, as this was simpler and there was no compounding problem, as the material arrived in form to apply directly in the C.V. machine.

To return to their plant inspection, they asked a number of questions in the rod mill and particularly with respect to quality control. They commented to me on the degree to which repeaters had been applied and indicated that they felt a good job had been done but that we could go further.

In the wire mill they were especially interested in the continuous wire drawing and welding practice and particularly with respect to the method of handling the coils so that they would not give trouble on the drawing machines.

In the weatherproof mill, they were interested in the knitting machines and the braiders and commented that for a long time they had avoided making any changes in their braiding plant on the theory that it was something they could get rid of and that this had been going on for some time. They apparently did not think very much of this operation and were not enthusiastic about staying in the braided weatherproof field. I did not gain the impression that they were interested in going into the knitters.

In the rubber mill they apparently became very confused at the complexity of the processes, the wide variety of machines and the inspection and quality control, as well as the final electrical testing. They seemed to regard the different forms of insulating and vulcanizing including the C.V. machines, the drum vulcanizers, the pan vulcanizers, and the lead sheath process as very complex.

[fol. 4999] They began to understand why so many compound formulas were required. They spent a great deal of time in the basement observing the stranded cable being vulcanized in one of the large machines and saw a splice made and run through the machine. This was the type of information that they were particularly interested in and keen to observe.

Upon returning to the office a long conference resulted, in which a great many detailed questions were asked, not only as to shop techniques but with emphasis on costs and cost methods. They seemed to be shocked to find that two 200 foot lengths of cable had to be scrapped each time the C.V. machine was shut down for splicing, for change-over, for quality defects, etcetera. This brought up the question of scrap metal salvage and they emphasized that this problem had not been solved. They asked Charlie and Rudy many questions and were surprised to learn that when Messrs. Davies and Noyes had been to Rome on the previous visit they indicated that this type of scrap could be shipped to Massena for recovery. The Massena representatives told several instances where the cost of recovery turned out to be more than the value of the recovered product and indicated that they had worked on the problem but had not reached a satisfactory solution. They agreed that Neoprene types would be the worst, because of the compound adhesion.

They were particularly interested in finding out how much shrinkage there is to a batch of compound and what the cost of ingredients was and if there was any salvage to the insulating compound. They were told that Neoprene had none and that under certain conditions scrap Polyethylene, being a thermo-plastic, can be re-used. As previously indicated, the Polyethylene seemed to be a way out for the factory and technical people in that they indicated it would be nice if they could settle for this and avoid the complexities of Neoprene and the tendency toward getting into border-

line insulated wire and cable problems. They certainly did not wish to go into immersion testing as it would apply to insulted cables.

Charlie and Rudy did a splendid job in impressing on them the competitive situation and the necessity for good production and minimum scrap. In fact I can say as an observer that both Charlie and Rudy must have made a great impression by their frankness, their manner of supplying the answers to a great variety of questions including those of a general and a detailed nature. They were heard to remark on several occasions that they had certainly been given every consideration. I particularly noted the fine teamwork between Charlie and Rudy in handling the production and technical questions and I am certain that this also made a fine impression.

It was clear during this conference that they wished to see more of the mill and that while it was late in the day and they had their bags packed and ready to go in their car outside, that they preferred to stay over night and return the following day. Therefore it was arranged to take them through the Spiral-Four Department, which lasted until approximately 6 o'clock, where Rudy and I took them to dinner at the Rome Club and then I drove them to the Green Lantern for the night. They were delighted with their trip to the Spiral-Four Department and commented on how clean the department was and what a fine impression it made. Upon learning the time from inception of the plant they were impressed with the accomplishment. They had little knowledge of such a complex construction [fol. 5000] and likewise the connecter problem but their engineering competence was quickly reflected in their ability to assess many or the machine features in the new equipment. They were very interested to watch the accumulators at work as well as the high speed stranders and cablers. They made a special note of the inspection consoles.

I have not mentioned their trip through the laboratory which gave Rudy an opportunity to show them the various testing machines, the pilot line for insulating compound mixes and the generally large amount of technical work necessary for a full line. There seemed to be some hesitancy on their part to contemplate getting into a business

not too close to their aluminum metal fabrication and we were able to point out that insulated cables were largely a chemical and electrical engineering problem, quite a different field from the mechanical and metallurgical problems which they normally dealt with.

The following day they went into conference and this continued until I left, during the lunch hour, for New York to meet Ross Fraser. The conference continued and I understood merely gave them more technical information without apparently altering the nature of their conceptions as far as they could be ascertained.

In summary, it seemed clear that they had come under orders to get as much information as necessary to help them to manufacture weatherproof wire and cable. All representatives of Alcoa seemed efficient and competent as far as could be observed and the writer is not in a position to know what their recommendations will be or whether they have been asked to make any recommendations other than as to equipment and methods for doing the job. However it would seem reasonable to assume that they left with a far clearer picture as to the complexity of the problem and secondarily as to whether they could stabilize their manufacturing on any simple basis, such as limiting themselves to Polyethylene wire or even Polyethylene and Neoprene types. As far as one could tell, they had no especial desire to take on these problems although this comment may not wholly apply to the technical engineers who were present as apart from the manufacturing men.

It would seem that Ross's hand should be strengthened by this visit in reaching or attaining the type of relationship that might be most desirable for the Rome Company and the Alcoa Company to have with respect to each other in this and allied fields.

Carl Ward

[fol. 5001] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 74

Aluminum Meeting, March 3, 1952

Present: A.D.R. Fraser, J.H. Dyett, G.E. Rolston, C.H. Ellis, R.A. Schatzel and G.A. Weiss

Ross: The meeting is called for a discussion of where we are on the arrangement with the Aluminum Company. I believe that the basis of the arrangement will be a memo which they will write to those in their organization and which will be approved by us, and in turn, we will write a memo for our organization which will be approved by them. This is not a final decision however. Bob Groben is coming at 2:00 o'clock today to review GAW's findings on prices, etc., and also to discuss the topics which should be covered in the memo. At the present time we cannot discuss prices; some costs, some ceilings are being assembled. I believe that on some ACSR and some of the Rolene no ceiling prices have been filed. Glenn and I have talked this over and believe that it would be better to deal only with those items on which ceiling prices have been filed. We will probably go to Pittsburgh one day this week on this matter. The next question is, who is going to take care of the arrangements with Massena or Pittsburgh on such things as tags, reels, lengths, etc. Rudy is preparing weights for some sizes, just on Neoprene.

R.A.S.: I am also preparing specifications for accepting conductor.

Ross: There are also the matters of reel policy, put-up, cartons and finally the question of publicity. I have asked Gerry to work on an outline of an announcement. At the meeting in Pittsburgh I hope that we will both agree on a letter.

C.H.E.: We might start on an outline of the arrangements with Massena.

Ross: I have asked Max to prepare the details on sizes he will ship down, so that we can take advantage of any open capacity in March.

R.A.S.: Publicity would have no bearing on what we are doing, since we are already buying conductor from them.

[fol. 5002] Ross: This month I think we would probably use our tags. Jack should check on lead time on tags, bills of lading, shipping documents, etc.

Ross: I think Holcomb should hop down here this week and determine who should handle these matters in his organization.

C.H.E.: I would like to see it set-up in the form of packaging specifications.

R.A.S.: I think we need specifications on the put-up that they ship to us I think it would be better for us to go up there for that. Could we arrange for 'Mac', and Gus and maybe Jack Kell to go up and talk over specifications?

Ross: I don't want to send more that four. Whoever is going to do the ordering should go up there. I would like to see the whole thing coordinated in some way. I believe that Pittsburgh's problems and Rome problems should be handled either by Sales or Administration.

C.H.E.: I think Holcomb and I should act as contact. Rudy and I should sit down and delineate the fields in question. I don't know what they know about finished packages.

R.F.: I think they would want that information from here.

G.E.R.: The sales would arrive at the package size, etc.

C.H.E.: I think that the question of the size to get here is a production problem.

R.A.S.: It also involves questions of where we can permit welds.

Ross: Suppose I talk to Ralph Davies this afternoon and tell him that we would like to have them designate someone to talk to Charlie and Rudy. We should prepare information for all sizes as to what our shipping package is, coils, size reels.

G.E.R.: Their reels don't match ours at all.

Ross: There is a question whether they will provide us with reels.

I would think that in the initial set-up that we could use our own tags, bills of lading, etc., just stamping something on them.

G.E.R.: I don't think we can. We haven't room on our tag.

[fol. 5003] Ross: How does their tag read now on shipments they send down?

C.H.E.: I think it reads in poundages.

R.A.S.: The specifications will cover lengths of lay, direction etc.

Ross: That is very important and also the question of diameter. Remember when we figured that over-diameter of one millimeter cost us 80,000 pounds of copper. Glenn suggested that we might buy the conductor, just for convenience in handling the accounting for such things as scrap.

R.A.S.: We will have to follow ASTM as to specifications.

G.E.R.: That won't be enough when it is a question of getting down to minimum.

R.A.S.: That's right, I meant on an average.

Ross: There experience is in selling by the pound. That is the way they will sell to us. We will sell by the foot. That means diameter is a vital factor for us.

G.E.R.: Every product except triple braid will be sold by the foot.

C.H.E.: Is there any possibility of handling it on a pound price, as we have discussed, in weatherproof.

J.H.D.: Couldn't they sell to us by the foot.

Ross: They could not do it on solid.

R.A.S.: We plan to set up specifications based on ASTM. Then we will have the laboratory inspect as if they were raw materials coming in. If they run heavy we will have to work out an arrangement with them.

Ross: That should be made definite in talking to them. Glenn, Max Noyes gave Fred a book. I would like to find out what we would have to do to sell ACSR that they manufacture.

G.E.R.: We would have to get an allocation from the Aluminum Division.

Ross: Can't we act as sales agent for the Aluminum Company?

G.E.R.: How do they want test reports handled, on Rome Cable forms?

[fol. 5004] Ross: This is a good point—will you make a note of that.

On publicity we have heard that someone learned that Aluminum Company had a second quarter allocation of

250,000 pounds for insulated wire and that some person objected saying that Aluminum Company only had capacity for insulating about 60,000 pounds. An Aluminum Company representative put a hypothetical case to NPA and got the answer that approval of a toll arrangement would not be necessary. There might be some considerable backbiting if the publicity is not handled correctly and even if it is. We certainly have to make an announcement to our sales personnel and also to our supervisors. Should we make an announcement to the trade papers? Glenn would you want to take over with Gerry working out a possible joint announcement?

C.H.E.: Isn't the announcement really that the Aluminum Company is going to sell insulated wire?

R.A.S.: In the first few months we won't have any aluminum to sell; we won't have any ACSR,—does it need any more than a simple announcement that they are making insulated line wire. That was my understanding.

Ross: It's not just limited to that and I would not limit ourselves that way. Putting yourselves in the position of a reader—wouldn't they ask how long this arrangement will continue.

C.H.E.: I understand that we will make any type that they want.

Ross: I made a definite statement at the Directors' meeting last Friday that this would stall our own aluminum project.

Ross: I judge that the sense of the meeting is that there should be a public announcement by ALCOA and that we would follow-up with an announcement that we had made arrangements for the sale of ACSR. I would think that the announcement would say something such as—that there was a great demand for aluminum products and that to meet the demands arrangements had been made for us to make the products for them.

C.H.E.: It could also say that this would be in line with the policy of making better use of existing equipment.

PLAINTIFF'S EXHIBIT 75

Aluminum Meeting Held March 10, 1952

Present: Messrs. A.D.R. Fraser, C.H. Ellis, J.H. Dyett R.A. Schatzel, F.S. Marks and G.A. Weiss.

Ross: This meeting is for the purpose of bringing the story up-to-date.

Glenn and I had a very satisfactory meeting Friday. They concurred in the arrangement we proposed, with the exception of paragraph 4, which was the one requiring that the Aluminum Company take all their requirements from us. Their lawyer refused to agree to this. They also asked for a longer time on revision of prices upward and we agreed to thirty-five (35) days. We tried to get them to go on a price in effect at time of shipment. They would not do it and explained that this was because it would be inconsistent with their present invoice policy. So we may have a little trouble on that point.

We both initialed the same memo. Jack has additional copies in the files. I would suggest that only those portions relating to the respective departments be kept in the department files.

We will prepare copies of their announcement to their people. They accepted our letter with two changes. The release time will be Friday. Charlie will handle the meeting with Jack with the Supervisory and Management Bonus groups.

In the statement I would suggest that we read first our letter then their letter. I would also like to see a statement like this—Rumor has come to us that the Aluminum Company was going to buy Rome Cable. State emphatically that there was never any conversations of that sort merely a fabricating arrangement. I think it would be well [fol. 5006] if Rudy Schatzel and Charlie Ellis said a few things about the advantages in this arrangement. There should be mentioned somewhere that we will have the opportunity to get into production of aluminum wire more quickly than otherwise would be possible.

We are going to handle the arrangement on a Toll Basis exclusively. That leaves one problem, what happens to scrap? In the figures that we had, we assumed that we had to buy the equivalent of 6% more of aluminum. That was assumed in calculating conductor costs, so we had scrap in the costs. Under this arrangement there will be a reduction in costs. Now we don't know whether they are going to ship us 106 or whether we give them footage production by 94%. I would presume that they expect to ship 106 and we to ship scrap back to them.

We told them that for two or three months we would try it and then see how things look and then we would make an adjustment.

R. A. Schatzel: They want to know what they are going to do with the scrap.

F. S. Marks: We are sending them some tomorrow.

Ross: I would suggest to Manufacturing, Research and Engineering that the individual cost cards be rechecked, having in mind what changes in production can be made; if we have cheaper neoprene; in running speed; and generally what changes can be made all along the line. Let's not forget that with Kaiser's price approval we will have quite a "rat race". Any improvement to reduce cost is extremely important. (Read revised schedule of sizes and types on the first 50,000 pounds). That the amounts are not good running amounts. If you want these can be varied. [fol. 5007] Coffin should be contacted. I have put a copy in Ken Murray's hands so that he can see what it will do to the operating schedule.

R. A. Schatzel: We have started some data on engineering specifications.

Ross: There have been no prices filed on Polyethylene by size. Calculations of price purely by formula results in prices higher than Neoprene, except in two cases. We will use the same prices as Neoprene.

Rudy, in the light of what has been done on reduced diameters on Neoprene, can something be done on Polyethylene.

I expect this afternoon to go over with Fred and Ken Murray the formula basis we have used in arriving at prices, so should there be ceilings filed we will have the mechanics here to produce the prices.

Gerry, in the light of the toll arrangement should we file prices?

G. A. Weiss: Yes.

Ross: We might try a hypothetical question on this.

I have told them that for the next two or three weeks they should call Jack Dyett, Charlie Ellis and Fred Marks.

During the trial period let's have suggestions on improving procedure.

R. A. Schatzel: Massena said they did not know what to do with scrap.

Ross: Coffin was sure they had a means of taking that off with some kind of buffing, some way of stripping Polyethylene and Neoprene off.

How long will it take to set up new standards on Polyethylene?

[fol. 5008] R. A. Schatzel: A.S.A. have new standards which I think are in line with what we gave you, but we don't know about commercial standards.

Ross: Keep Jack posted on all developments.

Internal Correspondence

March 14, 1952.

From: Philip T. Coffin, Pittsburgh Office.
To: All District Sales Managers.

Re: Covered (Weather-Resistant) Conductors

Mr. Wilmot's memorandum of February 28, 1952, stated that further information would be forthcoming on the subject of covered conductors. We know that you are all anxiously awaiting details of our plans, and that with the exception of the next paragraph the following information will be gratifying to you.

Plans for acquiring necessary manufacturing equipment and plant space have been actively explored, and a number of engineering studies and cost estimates have been made. The difficulties of establishing a new plant under present

conditions together with alternative solutions to the problem have prompted us to drop plans for a new plant for the time being, at least.

In order to enter this field immediately we have just consummated what we believe will be a very happy arrangement with Rome Cable Corporation of Rome, New York. Under this plan we will manufacture bare aluminum conductors and ship them to Rome where coverings will be applied in accordance with our requirements. This arrangement is to continue for a period of not less than two years.

There are several good reasons why we are working with Rome Cable Corporation. We regard Rome as a "high quality" manufacturer. We believe that their products are the best, or equal to the best, in this field. Also, Massena and Rome are fairly close neighbors—a matter of about 130 miles by either road or railroad.

There is nothing in this arrangement which prevents us from deciding at a later date that we should have covering equipment of our own, and this has been discussed very frankly with Rome Cable. We will reappraise this situation from time to time and discuss with Rome Cable [fol. 5010] Corporation the advantages or disadvantages to both parties of an extension of this arrangement.

The covered wire and cable products for the overhead secondary distribution applications which we will obtain by this method will be shipped from both Rome and from Massena. In either case they will be strictly Alcoa products in so far as markings on reels and coils are concerned; Rome will become another Alcoa shipping point. Shipments from Rome will be managed by Massena. Of course, there will be no secret about the fact that we are having Rome apply the coverings for us. In fact, we should brag about this because Rome Cable Corporation is our choice for the best product.

It is well to bear in mind also, that Rome Cable Corporation, like many other wire and cable companies which have previously concentrated on copper conductors, is now making aluminum covered and insulated conductors. Therefore, Rome will be manufacturing similar covered aluminum conductors, and selling under their own trademarks, Roprene, Rolene, etc. Since Rome will be obtaining aluminum

products from us for manufacturing into their own line, it is obvious that Alcoa and Rome will be selling some identical products. Rome also makes and sells many insulated wire and cable products which we do not propose to sell at the present time. The products which we will sell as Alcoa products are for the present limited to the so-called weather resistant types for overhead secondary distribution applications. These include Neoprene, Polyethylene and textile type coverings, or in some cases, combinations.

Due to Government limitations and to the newness of this project, our initial program must necessarily be rather small. For the second quarter of this year we plan to have Rome cover not exceeding 200,000 pounds aluminum weight of conductors. We have indicated to Rome that we will [fol. 5011] take in the second quarter only a rather limited range of sizes in either all aluminum or ACSR, both Neoprene and Polyethylene covered. However, we expect the program to be larger in the third quarter, and still larger in the fourth quarter.

The surplus capacity which Rome will have for our conversions naturally depends to some extent on the pattern of business which we obtain. We are assured, however, that their capacity can be increased in any reasonable quantity which we might sell, provided we give them adequate notice. For the near future the limiting factor will probably be the allocations which we can secure from NPA for the covered conductor program.

Rome Cable Corporation will supply us with technical data, specifications, etc. on their coverings. These will be issued to the Sales Offices together with our sales prices in the near future.

It is impossible to give you complete details in this memorandum, and we know that many questions will occur to you. These will be answered later.

Rome Cable is sending a copy of this letter to all of its District Offices. The counterpart of this letter, written by Rome Cable, is attached.

Philip T. Coffin.

PLAINTIFF'S EXHIBIT 77

Date: March 14, 1952.

To: All Salesmen.
From: G. E. Ralston.
Subject: Expanded Activity in Aluminum.

You well know the rapid increase not only in demand for insulated and covered aluminum conductors but also that more manufacturers are entering this field. Our production and sale of these classes of products has been and continues to be limited by the allocations that are given to us by the Aluminum Division of NPA.

For many months we have not only been experimenting with various types of insulated aluminum conductors but have also supplied many of your customers within the limit of those allocations to us. This increasing demand has also presented a good potential market to the primary aluminum producers and some aluminum fabricators, who in general had no facilities or experience for applying insulated coverings. On our part we have had no aluminum rolling, drawing or stranding capacity and only a limited experience.

In conversations with the Aluminum Company of America from whom we have been getting our bare conductor they indicated a desire to enter the aluminum covered wire field. As a result of several very friendly meetings we are, therefore, pleased to advise you that an arrangement has been made with ALCOA wherein we will insulate their bare aluminum and ACSR conductor with various types of insulations and coverings.

During the earlier stages of this arrangement, the products which we will cover for them will be limited to the various types of overhead service conductors, including fibrous, neoprene, and polyethylene line wire and triplex self supporting secondary and drop cables. As more conductor metal becomes available, it is quite possible that additional types of wire mill products with aluminum conductor will be added to those mentioned above.

[fol. 5013] These products will be sold by the Aluminum Company and will be shipped out on their reels and with their tag markings, shipping papers, etc. Actual shipments in their name will be made from Rome as well as from a stock in Massena, N. Y. We are going to provide complete technical information concerning the characteristics of our insulations and coverings to ALCOA, and they will in turn furnish their entire field selling organization with this data.

We will naturally continue to supply our present line of insulated wire products with aluminum conductors. This line will be expanded depending upon additional availability of aluminum. We will purchase conductor for our insulated aluminum wire products from ALCOA, thereby assuring us of the highest quality of aluminum conductor, and we will be able to take advantage of their broad experience in the field of drawing and stranding aluminum wire.

We believe that this arrangement is of mutual advantage to both companies, and its administration in our field sales activity will not present any major difficulties. Our high regard for ALCOA's reputation for quality can be capitalized in assurances to our customers that the ALCOA conductor plus our insulations presents the best possible finished wire product available to the trade.

In order that there will be no misunderstanding we assure you that in making this arrangement and the contemplated increased sale of aluminum by our own sales force we anticipate adequate facilities to service your insulated copper requirements.

We are attaching a copy of ALCOA's announcement to all of their sales personnel, which indicates their viewpoint of this arrangement.

Re: Weather Resistant Covered Aluminum Wire and Cable

I am a bit tardy in commenting on your letter of October 24 to Mr. Chapman. I refer specifically to paragraph 2, page 2. While I think you and I both understand our arrangement with Rome as we discussed it over the telephone, I nevertheless wish to re-state the arrangement in as much as it is not precisely in accordance with the paragraph in your letter to which I refer.

Unless there is an out and out "boner" there should never be a case where a shipment by Rome Cable Corporation would show both Rome Cable's name and our name on the product, the invoice or the shipping papers. In short, so far as our customers are concerned, if Rome Cable makes a shipment in our behalf as a result of having covered the conductor on a toll basis the product is strictly Alcoa's.

Rome Cable, on the other hand, purchases from us from time to time EC wire and cable which they themselves cover for their own account. The resulting product is strictly a Rome Cable product and should under no circumstances show Alcoa's name on the marker, the invoice or the shipping papers.

I am sure that all of our people at Massena understand this matter, but I think it is advisable for record purposes that the paragraph to which I refer be clarified.

Phillip T. Coffin.

[fol. 5015] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 79

Meeting on Aluminum Program for Rome Cable Corporation Held April 3, 1952

Present: Messrs. A. D. R. Fraser, G. E. Rolston, C. H. Ellis, R. A. Schatzel and J. C. Ward, Jr.

Ross Fraser opened the meeting by stating that we should proceed to investigate the general aluminum program and the Rome company independently of the new Alcoa agreement. He pointed to Lawrence's article in today's paper which concludes that our economy is in a most uncertain and potentially dangerous position for business. The changing condition with respect to metals was also discussed. It was, therefore, felt that this was the time to raise again question of installing the Properzi equipment and the aluminum drawing equipment. In respect to a question Ellis stated that roughly $235,000 had been appropriated for the entire program including the new Vaughn copper drawing machine which freed the old Elevator Supplies equipment for aluminum wire drawing.

Schatzel: What are the commitments that have been made to Alcoa that we need to consider?

Fraser: We have made no statement to them or commitment with respect to our own manufacturing. The agreement is that we are to get all of the aluminum requirements from them that we will insulate for their account. Alcoa knows of our plans for manufacturing rods, wire and ACSR. Tentatively Alcoa may make all of the ACSR for Rome account. However, since Rome adds nothing to ACSR this creates a problem under the Robinson-Patman [fol. 5016] Act, if Rome is to receive a better price than its competitors. The same news affects the prices for bare conductors, rods, etc.

The commitment to Alcoa is 200,000 lbs. by June 30, 300,000 lbs. for the third quarter and 400,000 lbs. for the fourth quarter, or 900,000 lbs. for the calendar year to be insulated for their account. For 1953 the allotment increases until at the final quarter it is at a 3,000,000 lb. annual rate with the total for the year 2,600,000 lbs. To do

this Alcoa has been told that Rome will expend $50,000. for new equipment. Should their demands prove greater than those stated above then we have 90 days to decide whether Rome will expand further.

Fraser also suggested to Alcoa that their might be a mutual interest in setting up a combined property elsewhere using the Properzi equipment and the drawing equipment which could be made available to be moved on the assumption that Rome could get all of its conductor for its own account here at Rome from Massena. His impression is that Alcoa would prefer to have their own plant for rods and wire also. At present they are short of capacity in the east which includes the territory as far as Davenport, Iowa, but they are long on capacity from their mill in Vancouver for the far western territory. He, therefore, felt it unwise to pursue such a line of discussion with Alcoa at this time.

Schatzel: Then we are clear to set up the Properzi equipment for our own experiments here?

Ellis: I am not clear on some of the economic aspects involved. I have been given figures on costs from Alcoa for rods and wire. Are these firm? Such figures were practically identical to Rome figures for finished strand taking advantage of the Properzi equipment. Had we known this originally we should not have put in the [fol. 5017] Properzi request.

Fraser: If it turned out to be advisable we can always sell the equipment that we have already ordered.

Ellis: I would not want to absorb into mill operations the cost of experimental work on the Properzi machine.

Fraser: Perhaps we may want to tread water for a bit until the picture is clearer.

Ellis: From work done in the last several days with Bob Fraser and Ward we could set up the Properzi equipment for experimental work and save $20,000. over our schedule and we could make available the variable speed drive for our insulating machine thus making savings equivalent to $30,000. Then with six months notice we could restore the program to its original plan if it seemed advisable.

Schatzel: But how could we learn anything from the Properzi equipment without drawing the rods to wire which we would not be able to do in accordance with this plan?

Ellis: If necessary we could use the Elevator Supply equipment for aluminum drawing by putting in $2,000 more for a dip system.

Fraser: On a 6¢ rod differential it is estimated the Properzi equipment saves 3¢. On this basis the regular Alcoa price to Rome is approximately the same as Rome's costs on the Properzi equipment with a difference of not over 5% to 8% on a few sizes.

Rolston: But what about the present Westinghouse flat sizes that we already need and are committed for? Alcoa can only furnish the rods in very small packages.

Ellis: We should order them anyway.

[fol. 5018] Schatzel: We have already sent up to Alcoa 28" reels for them to try. These give 1,000 lb. copper packages.

Rolston: But we already have 65,000 lbs. of ⅜ rods here now.

Schatzel: Perhaps we would rather send them back—to which Rolston agreed.

Ellis: Do the finished sizes run as for copper between small and big sizes?

Rolston: Yes, practically the same and we are still due 35,000 lbs. more rods for our first quarter requirements and another 100,000 lbs. for the second quarter.

Ellis: It isn't economics in this case as much as bull block capacity. We are late in getting the size distribution.

Rolston: I feel that the present system is too inflexible and we need more control over our own manufacturing.

Ellis: However, this is all a very short range picture that we are discussing.

Fraser: I understand that when Rome made its prices we were 16¢ high on Magnet Wire for Westinghouse. Westinghouse states that the aluminum is working out very well from their experience to date.

Rolston: Yes, we are also 10¢ high on copper Magnet Wire. Margins are very good and the question is, can Westinghouse afford to buy outside as against their own plant at Buffalo?

Fraser: Precisely, and how good is this business then?

Rolston: It is as good as for flat copper. Westinghouse assures us that they are going to use the output of our two glass insulating machines. When Buffalo made Sharon's

flat wire requirements about a year and a half ago they also made aluminum flats. He believes that they secured ⅜" rods and drew them and rolled them down.

[fol. 5019] Schatzel: With Properzi equipment Rome would have the advantage of getting the desired lengths in one piece, saving scrap.

Ellis: Alcoa must equip themselves to supply us with lengths in order to save scrap. We may have guessed in advance too high a percentage of small sizes.

Schatzel: To break even on the Properzi equipment what poundage per month must we make?

Ellis: Say 300,000 lbs. The question of capacity of strand equipment is completely apart from the ACSR program.

Schatzel: So far there seems more hesitancy by Alcoa to supply solid sizes in place of 7-wire strands. It was concluded that this may be inexperience.

Ellis: Our big capacity in Rome is in Larmuth and we have approximately 5,000,000 ft. capacity still available or aproximately 200,000 lbs. per month.

Schatzel and Rolston. That will be plenty up to 4/0. As far as solid vs. strand is concerned Alcoa will find that this will be specified by their customers.

Schatzel: Recent conversations confirm the fact that the use of aluminum wire and cable has been taken out of the hands of utility engineers by higher executives. Orders are out that wherever there is a 10% differential in price aluminum must be substituted for copper. The engineers feel that connectors and other problems have not been satisfactorily solved for such a decision.

Ellis: Feels that Rome has reasonable capacity for stranding needs and that this makes the Properzi process more interesting. It must be remembered that shortage in copper had a part in the original decision to fill in with aluminum. Therefore, said he, why swing from one posi-
[fol. 5020] tion to the other and feel that this is the time for all of us to agree to make a thirty day decision.

Fraser: Does this mean we do not need new stranders?

Ellis: Not necessarily, but ACSR should be left alone for the present until we see how far utilities will go in substituting aluminum for copper. Then too there is the question of mill flexibility with respect to such things as

flats. Alcoa, for instance, might not be willing to put up with the sudden shifts that we are required to meet for our customers.

Fraser: On 1,000,000 lbs. per month we estimated Properzi saves 3¢ per pound. How much can we save on 300,000 lbs. per month?

Ellis: Purposely I cannot say. At Davenport Rudy and I concluded that we could make a saving of more than 3¢. We can run on one shift as a basis if we desire and manufacture a lower output. However, we believed that we could get customers for rods in additioin to our own requirements.

Fraser: If so we may kiss Alcoa good-bye. We couldn't compete with Alcoa if they pared down their prices.

Schatzel: Nevertheless, we should operate the Properzi equipment to see what we can do and save.

Fraser: On 300,000 lbs. per month should we do it?

Schatzel: Do not feel that Rome should be so tied up with Alcoa that we lose control of our own production.

Fraser: We have two big gambles at present. One is the Sendzimer proces for galvanizing at Torrance. Second is our need to get into aluminum. Then came along the Alcoa agreement which must be taken into account. It is now obvious that there is no good rod source in the middle western area.

Rolston: This is all pre-supposed on the fact that we [fol. 5021] would not be eliminated from doing our own business. For instance, we get inquiries that we could not expect Alcoa to furnish.

Fraser: In any case we feel that getting the Vaughn machine was a good acquisition. We should set up the Elevator Supply machine for wire drawing though it is fully depreciated.

Schatzel: We seem to divide the aluminum manufacturing problem into two parts:

1. Drawing and stranding
2. Casting and rolling rods.

In any event we should commit ourselves to doing the first.

Ellis: Based on the fact there is reduced copper available we have a good chance of producing 5,000,000 lbs. of

copper excluding the use of the bull block. Theoretically we could produce 8,400,000 lbs. If we allow 1,200,000 lbs. for the bull block we can do 5,000,000 lbs. without the Elevator Supply machine and possibly 7,200,000 lbs. Believes that the Elevator Supply machine should, therefore, be set up in the new location for aluminum wire drawing in the simplest manner possible. This would not lead us into minimum cost processing but could be considered a transitional approach which seems desirable since every thirty days conditions seem to make a change in the picture. We must bear in mind that if we had unlimited copper and with the use of the new Vaughn drawing machine we could use all of the available stranding, in which case the transitional approach could be wrong.

Fraser: This serves to show how my mind is not fully clear what to do and I would like to hear from each one present in turn.

Rolston: I think we cannot operate properly unless we can draw and we can strand our own aluminum wire.

[fol. 5022] Fraser: But what about Properzi?

Rolston: I don't know. Perhaps do nothing unless you wish to find out what can be done with it.

Ward: It may be well to keep in mind that the Properzi equipment can be installed for approximately $20,000 or less based on the figures worked up in the last two days with Bob Fraser. This is $24,000 less than for the original set-up including the accumulator for continuous drawing and the variable speed drive, etc.

Ellis: Perhaps we can install the Elevator Supply machine for aluminum drawing in the "as is" condition for $5,000.

Mr. Fraser then called on Schatzel.

Schatzel: We should have our own aluminum drawing and stranding. Furthermore, it will take six months of experimental work to get the Properzi unit operating properly. Therefore believes it should be set up at this time.

Fraser: Perhaps we should wait two or three months but agree now on doing our own drawing and stranding of aluminum wire.

Schatzel: But if we can save 3¢ on the Properzi equip-

ment why not take advantage of it. I agree we should draw and strand aluminum in any case.

Mr. Fraser then called on Ward.

Ward: I would put the Properzi machine in the designated location in a simplified manner. I would also put the drawing equipment in the simplified installation. Perhaps this could be called a temporary solution as opposed to the long term solution for reasons that have already been brought out. This would permit us to use a transformer on order for the rubber mill, saving the purchase of a transformer for the new lead press. Charlie Ellis also desires a variable speed drive and, therefore, this [fol. 5023] could also be used at a saving elsewhere. As to the Aluminum Company objecting, it is my opinion that the agreement would prove to be a bad one in such an event and, therefore, I doubt that this would come about. Furthermore, the history of Rome shows that the business is continually developing and not standing still and that with this long term objective the desirability of installing purchased equipment in the simplest fashion possible seems to be desirable and in line with best policy. Now that Rome has factories in more than one location it is too early to say where this equipment ultimately may go. In any event the assigned location is not ideal, is limited in area and under tentative plans worked out by Mr. Ellis there might be more efficient and desirable locations in the period ahead here at Rome also.

Therefore, to sum up, I would install the Properzi equipment and the Elevator Supply machine in the designated location but in the simplest and most inexpensive fashion possible feeling that the long range picture will develop as time goes on and that the least will be committed by this solution.

Mr. Fraser then called on Ellis.

Ellis: I would do the same. I get scared when I consider the Alcoa forecast on their volume.

Rolston: I question the Alcoa's market reserve. This is too big a share for Alcoa when you consider the total available market and all of the competitors.

Fraser: I agree that it is optimistic. Their claim is, however, that their market analyses people historically are within 2%.

[fol. 5024] Ellis: I am satisfied with the program at least for the next thirty days.

Meeting adjourned.

J. C. Ward, Jr.

JCW:AS

[fol. 5025] In United States District Court

Plaintiff's Exhibit 80

To: All Salesmen.
From: T. S. Marks—Rome.
Date: June 5, 1952.

Subject: Covered Aluminum Orders and Inquiries.

We have been informed that there is a very good possibility that Aluminum will be decontrolled for the third and subsequent quarter of this year. We do not know exactly how this will be handled at the present, but in view of this, we want to outline our policy on the subject of orders and inquiries for covered Aluminum.

Effective at once, please feel free to talk with your customers about our ability to supply covered Aluminum. We have in the past had such a small allotment that many of us probably have told some of our customers that we cannot handle any sizeable amounts for them. This is not true any longer, and we suggest that you furnish quotations and accept orders for the third quarter and later on the covered Aluminum products which we announced we would produce. We repeat these products below so that there will be no question:

Knitted or Braided Aluminum Line Wire
Neoprene Covered Aluminum Line Wire
Polyethylene Covered Aluminum Line Wire
Neoprene Insulated Self-Supporting Service Drop
Polyethylene Insulated Self-Supporting Service Drop

We cannot at this time definitely tell you to accept orders on Aluminum Building Wire, Service Cables or RR Power Cables without asking you to contact us. As soon as this decontrol policy is definitely announced, we hope to estab-

lish our policy regarding the manufacture of these three products, but in the meantime suggest that you contact us if you have any inquiries. One of the deciding factors will be the quantities involved because we canhot set up to manufacture small runs, and we are not yet in a position to produce these items on schedules.

The purpose of this memorandum is to release you from any restrictions on acceptance of orders and quotations for the products that we definitely announced we will manufacture and also to encourage you to discuss freely with your customers our ability to make these products.

Our delivery at the present time on the Line Wire and Self-Supporting Aluminum Service Drop is August.

Yours very truly, F.S.M.

FSM:dr

PLAINTIFF'S EXHIBIT 81

Minutes of Meeting Saturday Morning—January 24, 1953

Whither goest Thou

Present: Messrs. Barnard, J. H. Dyett, Ellis, Rolston, Sarles, Schatzel with A. D. R. Fraser presiding.

ADRF opened the meeting by again stating that he wanted a very frank discussion on as many of the approximately twenty subjects he had previously outlined and that he expected to act largely as moderator. Many of the questions that he might ask largely to bring out the discussion might very well not even reflect his views.

The first subject for discussion was "Shall we continue the Alcoa agreement?" ADRF outlined the many complaints from quite a number of people in the organization on methods of handling the Alcoa business. In view of the fact that the contract will be about a year old by the end of March and Alcoa themselves will probably be reviewing their position he felt it wise for us to know where we stood because we had promised to give them at least a year if we decided to give up the agreement.

Glenn opened the discussion centering first on the competitive situation and the problem of our selling to the same customer. He outlined in some detail the difficulty of getting Alcoa to think as we do. For forty five years they have largely done as they pleased in the sale of aluminum. Their sales or pricing policies have been extremely loose. They have had very arbitrary distribution policies in the past and until the last five years have never sold through jobbers, at least through electrical wholesalers. It is quite obviously difficult for them to accept an established policy for selling. He feels that he is beginning to get somewhere in conversations so that they have some better appreciation for the problem. They have a different policy on selling from consigned stock. In summarizing the competitive phase GER felt he could live with the differing policies between the two companies.

ADRF had asked him to check with Alcoa on publicity covering expansion at Vancouver which might have indi- [fol 5027] cated that they were expecting to put in covering equipment at that point. He reported that the Vancouver development is only expansion of their drawing and stranding departments. They now have drawing and stranding and ACSR capacity at Massena, New York, Lafayette, Indiana, Vancouver, Washington.

GER reported that Alcoa was interested in our furnishing them with a larger quantity of Triplex, probably about double the quantity we have allocated to them.

This subject was also discussed at the time of our going over equipment plans for fiscal year 1953 and we authorized another Tripler. There was some discussion as to duplicating or modifying the present type that we have. In any event, a Tripler was approved and I can report that at a meeting of our technical group earlier this week that it was agreed that we should not duplicate the present equipment but modify the design considerably. This is going to delay getting the additional capacity because there will probably be about three to four weeks of design work necessary.

Coming back to the meeting we then discussed the subject of routine handling. Here things have been in bad shape. This is the place where we have had the most complaints. We had a very thorough discussion about this

and ADRF suggested the possibility of having a committee composed of those who headed up the various sections of our company in the handling of the Alcoa business during the past year and that they come up with a procedure which to them would be ideal, which I agreed to take up with Pittsburgh. Some members of the committee felt this was advisable but others felt sufficient progress had been made so that this would be unnecessary. All of this discussion was generated from GER's remarks out of which his conclusion was that we should certainly continue the agreement, RAS was next in line and he started his discussion as follows.

[fol. 5028] One year is too short a time on which to base a decision as important as this. He feels that Rome is always going to be a customer of Alcoa for some type of product. He feels that Rome definitely needs ACSR. He stated that Kaiser, Anaconda, General Cable, Reynolds, Southern and American Steel & Wire have ACSR as well as some others and they are able to offer both ACSR as well as covered aluminum. This, of course, then brought out the fact that we were penalized in not having ACSR to include with our covered aluminum so that jobbers could get the advantage of carload rates by combining the two products. ADRF then indicated that when he went to Pittsburgh in March he would again bring up the subject of their providing ACSR on some basis. It was agreed that it might even be to our advantage in the interim period to consider a possible consigned stock here from them and our handling it without remuneration in order to service our customers and get the advantage of net carload to jobbers.

The results of the very considerable discussion were that ACSR was necessary if we are going to continue in the aluminum business, or at least expand in the alumium business.

Charlie Ellis then held the floor and said he hoped that we could continue to keep this volume production in the plant as it was an excellent thing for us. We had gained much experience in the last year. We had volume runs that we would not otherwise have had. The three other members of the group seconded the expressions of opinion previously made and as a result I feel that the objections

which were many, even though small, are going to be faced more constructively in the future.

Aluminum—Properzi and Drawing Equipment

ADRF then introduced the subject of Properzi and drawing equipment in Rome. The Properzi equipment had just started operation earlier in the week. CHE said even on such a limited operation he was very bullish on the Properzi [fol. 5029] running without as many of the difficulties as some of our competitors have had. We certainly were benefiting at least up to this point on seeing Anaconda equipment running and getting the benefit of their advice on what pitfalls to avoid. ADRF asked whether, or how soon, we might be able to indicate from our initial experiments we might be ready to consider volume production because the matter of supply, not to mention where we were going to sell such volume, should be discussed and planned.

RAS asked that we be given about two to three weeks before we answer the question of when Engineering, Laboratory and Production Departments felt we might consider production for sale. This was readily agreed to.

It was brought out that the initial 30,000 lbs. that we had on consignment from Alcoa was 99.7 with .3 Boron. ADRF indicated from discussion with Phil Coffin of Alcoa that this particular grade was not only more expensive but was also scarcer. Alcoa thought that we should be looking toward the use of 99.55. It was agreed that RAS would investigate this and see what the possibilities were of our using it. There seemed to be an agreement that production at the rate of probably 1200 pounds per hour was easily possible. (Original estimate was 2000 pounds per hour.) Indications pointed to a production of about 250,000 pounds per month to operate efficiently. This presents problem of supply, particularly if 99.7 is required. ADRF then asked where the Sales Department would dispose of 250,000 per month and GER stated that we could use 125,000 per month in covered wire and 125,000 per month in bare drawn for other fabricators. Going beyond this, and to use the greater capacity of the Properzi equipment, ACSR would be the main outlet. CHE indicated that we had some capacity to do some steel stranding, or ACSR stranding rather, and we would supply the individ-

ual conductor from our own drawing. He will again review how much of this is available. GER will review potentials of ACSR from Rome.

[fol. 5030] "Whither Goest Thou"

I opened this discussion and used the strange quotation above in order to get an expression of opinion from the group as to how they personally felt about where we were heading in Rome Cable. The importance of our determining just what our best thinking was on this subject would determine whether we stumbled into the future or whether we planned for it. I also indicated it could have quite a considerable effect on the group as individuals as well as the Company. Were we interested in carrying on our meteoric rise which might even be considered as potentially continuing if we listened to the estimates of the future or were we interested in staying just a medium sized Company maintaining all the current high standards and keeping up to date but, of course, sacrificing volume. I particularly stressed the ever westward growing center of population, the very important factor of freight, as well as a number of other factors which penalized a plant having only one location. I also brought into discussion HTD's mention at various times of the potentialities of a branch plant located at Texas. I further indicated that certain preliminary studies had been carried on regarding locations in Texas. I also indicated that certain freight studies were in process of compilation and review. HWB expressed himself that if we expand he did not feel that Rome was the place and that if we stopped growing we would probably slip backwards. He preferred to reserve his decision or recommendation until more facts were available. Rudy indicated that he did not feel we could stop growing, that we should continue to grow in Rome, that our entry into the utility field was important and that that line could be further expanded. If we go outside of Rome that should only be done after a very considerable study. We must determine whether we are going to meet competition all over. He brought out that Magnet Wire expansion cannot be done in Rome, aluminum expansion cannot be done in Rome, and Electronics, particularly in the communication field, cannot be done in Rome. He felt that being the kind

of company we are that both expansion in Rome and at [fol. 5031] some outside point or points was a natural evolution.

I called on Glenn Rolston next. He indicated he was more of a conservative. He did not feel that the use of kilowatt hours as a growth factor is going to continue to be proportionate in the use of wire and cable, that utility central stations did not use as much wire and cable as they did years ago. He favored consolidating our position here in Rome and that as he viewed the competitive picture there were probably some products in our present line that we may have to discontinue making, but he also added that there are other types of products that will probably use that equipment and that proper studies should be made accordingly. With particular reference to the utility field he indicated that Bare and Weatherproof were going to be unprofitable in certain districts and that we would probably have to retire from competition in those districts. We should concentrate, therefore, on power cables and other specialized items. We should promote aluminum, assuming that Rome is the place to do so. He felt that not only as far as products were concerned but we should consolidate our position as far as individuals were concerned. He felt that in the rapid pace we had been traveling in the last few years that of necessity we had all lost a considerable touch with certain important phases of the operations. He dreads the thought of expansion other than at Rome. He urged greater reworking of our product. On ACSR he thought that if we were limited to Rome we would only be able to do a job in a very limited area. He questioned expansion of facilities. We should improve methods and reduce costs.

Charlie Ellis was next and he said that if past history was any criterion he does not believe that the basic dynamic spirit on which we were founded and have exhibited since the start could be changed. We will have difficulty in saying "no" to opportunities that are thrown at us. He agreed that we would carry on refinement in our present product line and attempt to improve. His bet was that we will expand. He also felt that we must look toward still making big outlays of cash for equipment to take care of changes in product mix or improve production methods.

[fol. 5032] More and more as we have established our reputation will the kind of opportunities be offered to us which are a challenge and which we probably will not be able to resist.

Jack Dyett indicated that on the basis of past experience, that while we thought we wanted a relatively small company, we seemed to have had expansion whether or not we wanted it and he cited Torrance, aluminum, Spiral 4 as examples of this particular point. He personally is for normal expansion, urged that in keeping with our earlier meetings that we get our organization in shape to meet the future so that we might be better prepared if opportunities develop. We should view the immediate future considering timing as being one of the important parts of it. He felt that perhaps we might continue our expansion trend possibly two or three years from now. He urged that we look at expansion but, like Glenn, that we consolidate first.

Jay Sarles indicated that there was gold in the hills in the expansion program that we have had and have carried on for some time. He stated that he preferred one operation here on wire and cable with better cultivation of our present facilities. Summing it up, he favored modified expansion here at Rome.

In summing up the views it must be borne in mind that these views were expressed without any supporting data on freight or profits or any other information. It was merely my questioning them about what their thinking was regarding their hopes or thoughts for the Company in the future. Summing it all up, they agreed that Charlie and Rudy were more inclined to expansion outside of Rome, while agreeing that we should consolidate our position in Rome. Rudy, of course, indicated that there were quite some considerable places for expansion here in Rome on our present line. Glenn, Jack and Jay were more inclined to modified expansion in Rome. Harry, as indicated, desired to reserve his vote.

In any event, discussion brought out that we were not going to exactly stand still so I then asked whether any of them had any thoughts of what we should do regarding [fol. 5033] our organization in order to prepare ourselves better for what seemed to be our future destiny. Jack suggested that on students where we had agreed in our

organization audit that we needed more, that we should start earlier and provide opportunities. Charlie felt we needed more assistants for top people. Glenn was somewhat worried about our method of training men. Harry thought the President needed more assistants. The President felt that there should be more attention paid and the staff built up to handle such things as public relations, administrative assistance, market analysis, sales promotion, expansion of internal sales, expansion of interpretation of reports and that we plan our training program better for employees and for supervision.

The meeting adjourned at 1:45 'til 9:30 Sunday morning.

Meeting—Continued January 25, 1953, Sunday Morning Session

Before we started on our main subjects for Sunday morning I introduced the subject of excess profits tax money. I indicated that we had embarked on a program with Cornell and started a movie and certain other projects, having in mind carrying on the investigation during this particular period hoping that results would be forthcoming or at least trends indicated by the time the Excess Profits Tax expired. I stated that we all believed that taxes would undoubtedly be high for a considerable period of the future and that we should possibly explore any other items that would fall into the same category as those previously started. I particularly brought up whether we should expand our outside research contact. Rudy answered promptly by saying that expansion must not mean dilution. A strong central core is necessary for research. He felt that we should draw on outside services for the "dreamer" type of research. He is not interested in a divorsed central research. He further expressed himself as feeling that we should not tie our-
[fol. 5034] selves wholly to one university, that there were many opportunities for specialized work with other fine technical institutions. In fact, he brought out that Dr. Winding in his work with us was also using the technical facilities of certain other institutions in order to get the best help on some of our problems.

The only other remark made at this point was that Charlie Ellis felt that if we were carrying on any expan-

sion program or looking for expansion in some other location we might carry on some of the engineering work and get some outside help so that if the decision was ever made to actually do the expansion all of the preliminary work would have been done.

Capital Expenditures for 1953 Fiscal Year

Charlie Ellis than took the floor and said that in presenting the report we could look at the minimum recommendations of the Rome Engineering Department for that plant at somewhere around $450,000, but they also had a program that would run as high as well over $1,800,000. He then reviewed in detail the recommended items on the smaller program. Copy of the detailed report is attached. As you review the maximum total suggested I think you will be impressed, as I was, with the very sizable amount of buildings and the relatively small amount involved in increased capacity. The items marked "X" on the exhibit were the ones recommended for prime consideration in the new fiscal year. Going down the line on "Class 1—Primary Capital Items" you will note an item of $106,550 to get a new superstructure in Building 1. This is the present Shipping Room which is in bad shape and calls for some building out over the tracks. The third floor office section expansion over Building 15, the present Conference Room, Production offices and Laboratory, has a counter-suggestion of making a separate Laboratory and turning the present Laboratory over to Production offices and other uses. As a means of providing room suggestions were made in lieu of this suggested expansion program that some of the Laboratory be [fol. 5035] moved over to the old office which would relieve some congestion. I also suggested the use of certain portions of the Spiral 4 offices which would not be used with the reduced schedule there. The program calls for 14 new fine wire machines which would give us about 80 to 100% of our present capacity with new fine wire equipment. Our costs are high on this particular product, as you know. It was also brought out, however, that many of our present fine wire customers had installed their own fine wire equipment and that we might not have as sizable a market in the future and that study should be given to this. A more intensive study of Cooke annealer should also be done.

When we reached discussion of the Laboratory it was brought out that the current list as submitted did not contain the requested items for the Laboratory for 1953. This would add some $20,000 to $25,000 more. When we came to the Compound Department I think I told you that certain special recommendations were being made on that but which had not been resolved so that will await future developments. Likewise, it was brought out, as I mentioned in the Aluminum report, that Alcoa now wants a million feet per month of Triplex wire. This would mean adding another Triplex machine. Discussion ensued during the morning as to the type of machine. I have already brought out that we need modifications on the present type and that the Engineering Department will design a new machine. This, however, will delay our increasing our capacity by several months.

On "Class 3—Capital Items of Experimental Character", Charlie included the Synthinol project of replacing 50 h.p. motors with 100 h.p. motors on Plastic Extruders #4 and #5 and replacing a 20 h.p. motor with a 30 h.p. motor on Extruder #65-3. This would cost $24,000 and was included in the overall total of minimum expenditures. This program alone would save $50,000 a year.

The controlled temperature feed for C.V's and plastic compound powder mixing and extrusion also included under [fol. 5036] Class 3 were recommended for inclusion in our program.

"Class 4—Capital Items for Future Consideration" carries the recommendation of $100,000 for 10 Vaughn fine wire machines as worthy of consideration in the new fiscal year. I have given you our discussion on the ACSR and you will note that that involves an expenditure of $285,000. I believe that while our other discussion indicated the necessity of having ACSR in our line, we had other considerations brought out that should be explored first before any decision is made.

After Charlie finished we had a general discussion and I mentioned that I felt the trend was going towards need of more cabling equipment and that we didn't have proper ranges. We either had good equipment for small or good equipment for large, but that we were out of the competitive picture on certain intermediate items. Rudy brought out

that more tank test room was needed and that three new sparkers, Entwistle type, at an estimated expenditure of $15,000 were quite essential. We urged that a good floor area study should be made with particular reference to the demands for the Spiral 4 building. We discussed the advantages of closing Henry Street and connecting Spiral 4 with the present Insulating building. I asked that the factory and plant engineering check with both research and development engineering as well as the Sales Department as to new products and added capacity for present products in their viewpoint for the future.

We next tackled the question of Torrance requirements for fiscal year 1953. Their original request amounted to $151,000 which we cut down to about $35,000 as items that should be considered for the new fiscal year. We definitely felt that any other expenditures should await the results of the actual production of the hot dip rigid.

As you can well see from the above and the perusal of the items submitted this was quite a session in itself.

[fol. 5037] Subject: Torrance

I opened the discussion on Torrance by referring to our Organizational Audit meeting wherein we had very thoroughly discussed the question of top management at Torrance. Various names were suggested in the event of an emergency in that meeting.

I stated I wanted to have a very complete discussion of Torrance problem because I knew it was thought of by some as "Fraser's Folly". I indicated I planned to go to Torrance early in March and read copies of both Art Andersen's and Gil Woodill's letters of reply to my letter of January 2nd. I expressed the feeling that if the production troubles on rigid were reasonably well in hand by that time I saw very little problem about coming to some agreement that would make everybody's life much easier. I stressed the size of the investment which we had there and regretted that we had no projected costs on rigid to indicate potential profits. These are being prepared and should be in my hands by the latter part of the week. These have since been received and are being studied. There is some amount of discouragement in them but also some amount of encouragement. Both Charlie and I feel

that they are ultra conservative. Continuing the meeting Charlie Ellis suggested that possibly some one could be brought to Rome to get further indoctrination in our management policies. He also suggested the possibility of getting a conduit man and integrating him to our policies or possibly getting a Rome man and integrating him to conduit problems. Jack suggested that it might be better to have someone from Torrance coming here more frequently and staying longer. Charlie felt it would be well in their present production difficulties to keep away from there at the present time.

[fol. 5038] I really started some very serious discussion when I asked whether the amount of discouragement that we had had on Torrance indicated that we should sell it. I told them I felt that I could think of at least four people who would definitely be interested. This suggestion was greeted by a resounding "No" from the entire group. Glenn feels that he needs it as a product in order to keep down the overall cost of his Coast operations. Rudy felt that it provided a good base for Coast operations. The importance of improving their quality control was stressed and Rudy reported it is under way. After all the discussion it was felt that the present method of contacting be left as is, but that on production matters, rather than Jack and Gil discussing the differences those should be referred to Charlie and he taking them up with Art.

The difficulties of operating with a three thousand mile space difference were stressed.

I asked how important the lack of sizes above 2" would be. GER said that it will be a big problem on individual projects. I then asked whether we would be interested in getting some one to supply us with sizes above 2" for the West Coast, whether we would be interested in having conduit available in our Eastern operations in making an arrangement with a supplier, whether we would be interested in making the West Coast needs of that supplier, whether we would be interested in selling a portion of our output to someone like Essex for example. I also asked whether we would be interested in production of mechanical tubing.

In answering these questions it was brought out that as far as not having the sizes above 2" are concerned we

are always dealing with the jobber and we would only get a certain percentage of his business anyway. O. I. Lewis is going to the Coast for a trip in about three weeks and he expects to evaluate this question.

[fol. 5039] On the question of manufacturing for another on the West Coast GER felt that he would prefer to capitalize on our location ourselves. He does not want to manufacture for Essex.

The question of mechanical tubing is being studied but to date he felt our costs had been out of line.

Before adjourning the meeting on Sunday morning I stated that I had several answers to my letter of January 2nd wherein suggestions were made to reinstitute the old Planning Committee as such. Perhaps with not as frequent meetings but to get together in the larger group. I pointed out that in the past while all the members of the Committee indicated that they would make suggestions for an agenda, generally the agenda was left entirely up to me and in many cases we were educating quite a group on various company matters and that in doing so our progress and our results were frequently slowed up. I had also had the criticism some people had resented the feeling that they were being placed unnecessarily on the spot before too large a group of people. The Executive Group at the meeting felt that the smaller group was much better and it was their responsibility to see that their assistants were kept informed, rather than adding that to my responsibilities. Noble resolves were made in that direction.

Meeting adjourned at 1:45 with the general expression from every one that the group meetings had been highly successful and they were ready to tackle the other sizable number of questions as soon as a mutually convenient time could be arranged.

[fol. 5040] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 82

April 7, 1953.

Mr. Ralph V. Davies, Vice President,
Aluminum Co. of America,
801 Gulf Building,
Pittsburgh 19, Pa.

Dear Ralph:

This is the first opportunity since I got back to sit down and summarize some of the things that we talked about last Wednesday. I will not attempt to cover Messrs. Rolston and Schatzel's visit to your Kensington Laboratory, but I do know that they were very much impressed and felt the trip was very worthwhile. I, too, can say that about Wednesday's visit.

As you recall I opened the discussion with the desire for the usual frankness regarding our mutual agreement. I believe we both recognize that up to the present time it has not been as profitable as it can be for either party. I think we both entered the agreement with the thought in mind that there would be a period of experimentation, with our getting acquainted with the running of aluminum and your getting acquainted with the covered wire and cable industry.

We recognize that your organization must of necessity keep abreast of developments in our industry and it is our job to sell you on our ability to manufacture your requirements on a profitable and friendly basis for both parties.

I gathered from expressed opinions that you had no immediate idea of embarking on your own manufacture and that the present agreement did not require another extention and was adequate for our present needs. The volume as estimated by Phil Coffin would run somewhere near 3,000,000 pounds of bare conductor for the current calendar year, which is the same as was estimated a year ago. He brought out that his sights had been raised on Triplex to approximately 1,000,000 ft. per month, which would need from 80,000 to 100,000 pounds of bare aluminum and he estimated Neoprene Line Wire at 150,000 to 200,000

pounds of bare aluminum. He indicated that just as we have found the situation he was more pessimistic about Polyethylene. We discussed the possibility of our furnishing you a special textile type that might run to several carloads per month for American Gas and Electric or similar customers. I indicated that we would probably give you a price on textile covered aluminum that would obviate your operating your small department at Massena, should you so desire. On the subject of Building Wire you indicated that because of its manner of distribution this was a field where we should do the developing and selling and that you had no intention of entering that field at the present time.

We brought up the subject of the heavy stock and large amount of our shipping space now presently used in carrying that stock for you. Phil indicated that you expected to release half of that stock stock from Rome and will try to plan to keep the stock at about 2,000,000 ft. in the future. While we were on the subject of supplying material we raised the question of extreme scarcity of Neoprene. If we find we are unable to better our supply we will get in touch with you in an effort to get some allocated to us for your needs.

[fol. 5041] We brought up that we still did not know the real evaluation of the scrap which was on hand at Massena and Phil promised to follow through and get us some decision on that.

We discussed the matter of longer lengths on reels as supplied by you and we understood that there is some possibility of your sending us 30" reels but that the investment for larger supply reels would cost $25,000. We did not attempt to cover details in the larger meeting but touched on certain problems that we had had on deliveries, damaged shipments, specifications and a number of other misunderstandings. Out of all this there came an indicated need for a good liaison man for ALCOA, first talked of as being located at Massena but later in the afternoon suggested as one possibility for Rome. We indicated that we would be glad to do everything possible to train such a man in the practices of the industry.

At lunch I brought up the subject of ACSR and out of that came a very considerable discussion. 1) by the use

of the Properzi equipment we could make a limited quantity ourselves. 2) a toll arrangement similar to the covered toll arrangement you have with us might be worked out in reverse.

I then brought up the fact that perhaps if we operated from pig on consignment using the Properzi rolling and our drawing equipment with longer lengths plus certain other changes that we were making in our covered processing we might be able to come up with a packaged proposition on covered wire, which would be more profitable for both parties. We are making some preliminary studies on this possibility and will get in touch with you when they are completed.

We discussed the matter of a long term contract for pig and after learning its purpose we agreed to send in our contract and estimate that it will run from 250,000 to 350,000 pounds per month.

We had some other discussions regarding your being able to supply us with a conductor to compete with a new Kaiser product, similar to Aldrey, being used in self-supporting cable and Phil Coffin and Max Noyes went over the matter with Rudy and Glenn and suggested a program involving certain samples from you.

I think this about covers the main items that we discussed. Again, thank you for a nice lunch and a very pleasant and constructive day.

Sincerely, —— ——, President.

ADRF/m

PLAINTIFF'S EXHIBIT 83

May 4, 1953.

1952

Research and Engineering

During the year progress has continued in the improvement of our products and wider acceptance in utilities and important industrial fields. While the shortage of metals have sometimes handicapped, we have attained a recognition in the chemical and petroleum field which promises to de-

velop. Our Laboratory has made excellent progress in the investigation of the many new synthetic Polymers and in adapting them to our uses, as well as to investigate and adopt new processes for our production. Among these, while still under development, we may mention cold feed of rubber compounds with the elimination of warm-up mixing, the continuous casting and rolling of aluminum rod, and the powder mixing of plastics. This year has also seen our production of Silastic insulated wire and the completion of extending our range of sizes of glass covered Magnet Wire to smaller sizes as well as the production of considerable amounts of aluminum glass covered Magnet Wire. We make no prediction of the future growth of aluminum in this field, but we are prepared to explore and take advantage of any trend.

Our department has supplied Sales and Manufacturing with Technical Service in the form of data, Sales Bulletins, etc. We acknowledge the excellent cooperation received from all departments. A few of the more important items are listed below:

1) Aluminum—Continued expansion of sizes and types of products. The initial development of continuous casting and rolling of aluminum. This is still in the pilot plant stage. Development and production of glass covered Magnet Wire. Obtained approvals of Service Drop Cables from REA.

2) Rome 60—Completed development of rubber jackets and insulation to comply with low-temperature requirements of Air Corps and obtained approvals under Military Specifications. Offered and accepted business (Lincoln Electric) on lower cost Welding Cable. Extended Rome 60 (CV) to include 4 conductor #12 AWG.

3) Magnet Wire—Extended range of glass covered Magnet Wire from #14 through #22 AWG. Cooperated with and obtained approval of ASESA for Glass Magnet—Aluminum Glass Covered Magnet Wire.

4) High Voltage—During the year signed a license to operate under patents on Strand Shielding (License under Peterson Patent). Recognition of our RoZone insulation was continued as evidenced by our supplying in a wider area both Control and Power Cable up to 15 KV ungrounded [fol. 5043] neutral.

5) New Processes and Equipment—We completed an investigation of our recovery of copper from Rod Mill wash water with the assistance of our Research Consultant at Cornell University. Recommendations for installation of equipment were made in cooperation with our plant Engineering department. When complete the savings in copper will be sufficient to pay for equipment in about a year and at the same time overcome a troublesome problem of stream pollution.

Our Properzi Continuous Casting equipment was installed by our plant Engineering department, and has been operating as an experimental development unit by our laboratory. Much time and study were given to the selection of equipment and its installation by Mr. Fraser and Mr. Fitler of the plant Engineering Department. Because of this and the cooperation of Anaconda in permitting our men to study and witness the operation of similar equipment in their plant, we have been enabled to greatly reduce the time of actual reduction to practice. There are still many problems to be solved, and improvements in the way of refinement and instrumentation to be made. The equipment is producing and it is planned to turn it over as a production unit on July 1.

The installation of new continuous lead press is complete and operating. Its use will permit extending our lengths of lead covered cable, and reduce the patching of larger sizes of rubber sheathed cable with a consequent improvement in quality and cost.

We have been investigating the Cold Feed process as developed by Western Electric Co. for about two years. This has required changes and development in equipment, in processes, and in the compounds used. Through the use of this method a step in the processing of rubber, warming up, is eliminated with elimination of rolls and floor space, It also permits close control of dimensions and consequent saving in material. Our first unit is now in limited production.

6) Among the new products developed and approved are some which as yet have not entered our commercial picture to any extent but bid to do so during the coming year.

Underwriters' approval of an all plastic type of Barn Wire (RoBarn) has been obtained on a design developed

and submitted during the year. This is lower in cost than our present RoBarn. At the May 18 meeting of NFPA it is expected this type will be approved as a new type of underground feeder (Type UF).

[fol. 5044] Approval of Government departments has been obtained on the four most popular sizes of High-Frequency (RG) Radar Cables. A new multi-paired Polyethylene insulated Telephone Cable line for pipe lines and certain REA uses was completed and approved.

7) We would like to again mention Spiral 4. While the volume of this product has decreased, we have maintained a high standard of quality and efficiency. This has recently been recognized by the Signal Corps in accepting a Manual of our inspection prepared at their request, and in placing Rome Cable on reduced inspection. We are proud that Rome Cable is one of the first companies manufacturing any product for the Signal Corps which has been accorded this recognition and confidence.

General—With the elimination of controls we are already conscious of the increased tempo of competition, both in costs and quality. Increased supervision and facilities in our inspection department, have been provided or are planned. Many new suppliers of established materials or of new materials make their appearance. While there have been two suppliers of Polyethylene, plans are now completed so we know we will have seven producers. Other companies are entering the field of Silastics. With the turning over of synthetic rubber to private industry new problems will be presented. Our laboratory is alert to these developments, and plans to cope with them. In this field we have the assistance of our Consulting arrangement with Dr. Winding of Cornell.

During the year an Industry Standard for Butyl Rubber insulation was adopted by IPCEA. We are prepared to furnish in accordance with this; while there was efforts made at standardization of several other specifications, progress has been disappointing. The years ahead will be one of even greater activity in this direction.

Two years ago the Industry (ASTM and IPCEA) adopted specifications for moisture-resistant rubber which appeared in Rome Cable specifications first in 1946. In our high-voltage specifications in 1947 we were the first to in-

clude a requirement for corona-level requirement, by equipment developed by our engineers. During the year we have been pleased to see this method adopted and advertised by the largest electrical manufacturer and one of the principal utilities, so that it is gaining wide recognition by producers and users alike. An industry committee has been formed to draw up a recommended Standard of Corona-level testing.

Rome Cable Manual published in 1947 has gained nation-wide recognition, and is known in many countries. Plans are under way to revise and bring this up to date for publication early in 1954.

[fol. 5045] We have had one patent No. 2,635,136 for Sparking Equipment issued in 1953. We have issued a license for a manufacturer to make an improvement on continuous vulcanizing equipment on which a patent is pending.

R. A. Schatzel.

ROME CABLE
CORPORATION

ROME, N.Y.

REPORT SUBMITTED TO THE BOARD OF DIRECTORS OF ROME CABLE CORPORATION AT THEIR MEETING SEPTEMBER 2, 1953

I present herewith net sales and earnings by fiscal years up to March 31, 1953, the April-June quarter of this year and also the month of July:

Fiscal Year Ended	Net Sales			Earnings
March 31, 1937	$ 1,798,092			$ 1,436
March 31, 1938	4,957,103			71,087
March 31, 1939	5,370,665			245,036
March 31, 1940	6,080,902			297,736
March 31, 1941	9,465,851			431,501
March 31, 1942	11,631,785			592,135
March 31, 1943	12,712,333			367,654
March 31, 1944	16,909,735			446,709
March 31, 1945	22,796,218			486,653
March 31, 1946	16,975,009			398,973
March 31, 1947	18,436,305			1,359,593
March 31, 1948	25,202,853			1,152,579
March 31, 1949	26,088,523			1,115,960
March 31, 1950	19,602,984			302,209
		Add: Portion of metal profits set aside in prior years to offset copper loss		150,000
				452,209
March 31, 1951	35,142,901	Net	$1,922,136	
		Transferred to earnings retained	150,000	1,772,136
March 31, 1952	42,657,848			1,753,651
March 31, 1953	54,632,976			2,008,321
April - June Quarter	13,858,372			528,190
July	3,289,935			91,481
Total 4 months	$17,148,307			$619,671

It will be noted that the sales for the first four months are at a lower pace as compared to last year. The uncertainty overhanging the copper market

[fol.5047]

ROME CABLE CORPORATION

is apparently a deterring factor and our customers appear to be holding down orders until prices appear firmer.

Torrance P and L figures for the first quarter of this year show a net loss of $12,926, but with July sales of $402,903 a small profit of $1,446 was made. Sales in August were particularly disappointing. More about this situation later.

The breakdown of sales April to August 31, 1953, with August figures estimated, are given below:

	April-August 1953	April-August 1952	% Increase or Decrease
Rods	$2,583,000	$2,317,035	11.5%
Bare	3,137,000	2,285,832	37.2
Weatherproof	1,330,000	1,319,617	.8
Magnet	1,369,000	1,371,017	-
Rubber Covered	8,355,000	8,050,407	3.8
Torrance - E.H.T.	1,106,000	1,211,362	(8.7)
T.V. Mast	234,000	-	-
Spiral 4	2,781,000	6,211,024	(55.2)
Aluminum	936,000	523,802	78.6

Figures on investment and net return on investment are shown for the last three years on both the Rome and Torrance Plants as follows:

	March 31, 1951	March 31, 1952	March 31, 1953
ROME PLANT			
Investment	$10,474,000	$10,578,000	$10,808,000
Earnings	1,798,000	1,614,000	1,993,000
% Return	17.2%	15.2%	18.4%
TORRANCE PLANT			
Investment	$2,206,000	$3,496,000	$3,821,000
Earnings	124,000	139,000	15,000
% Return	5.6%	4.0%	.4%

Inventory investment at our Torrance Plant is shown below, which indicates a growth of nearly $600,000 in inventory valuation since July 31, 1952.

	July 31, 1953	March 31, 1953	July 31, 1952
Cold Rolled	$529,159	$459,807	$381,944
Hot Rolled	737,461	626,741	349,710
Zinc	117,819	106,748	67,480
Other materials, Labor & Expense, etc.	316,297	302,544	337,264
	$1,700,736	$1,495,840	$1,136,398

In addition to the above inventories we have authorized consigned stocks of $260,000 of E.H.T. and $258,000 Rigid, a total of $518,000. I am told that these stocks are necessary under present conditions in order to promote sales.

[fol. 5048]

ROME CABLE CORPORATION

The backlog of orders is as follows:

		Quantity-Pounds	Value
January 30, 1953	Wire & Cable	13,966,000	89,290,000
	Aluminum	878,000	753,000
	Spiral 4	1,407,000	8,775,000
	Torrance	-	266,000
May 31, 1953	Wire & Cable	10,971,000	7,039,000
	Aluminum	660,000	483,000
	Spiral 4	963,000	5,406,000
	Torrance - EMT	-	3,600
	Rigid	-	219,600
	T.V. Mast	-	42,000
August 15, 1953	Wire & Cable	6,388,000	5,116,000
	Aluminum	567,000	502,000
	Spiral 4	735,000	4,110,000
	Torrance - EMT	-	113,000
	Rigid	-	107,000
	T.V. Mast	-	44,700

Although the copper supply situation appears solved with most suppliers offering nearby shipment, the price confusion continues to exist. Chile has accumulated approximately 85,000 tons of copper which have been offered to the American Government at the world market price of about 29 cents a pound. However, the fabricators of the two large American companies with Chilean properties must still pay the 36.50 cent level. In this Country the producers are charging 30 cents a pound while copper can be purchased from the smelters at 29 cents and under that from certain foreign sources. After an unexpectedly low opening of the London Exchange on August 5th steady European buying has firmed the price to figures approaching our domestic quotations. In the United States, however, fabricators during the past two months as well as for September are keeping their copper purchases to a minimum.

The maintenance of high copper prices throughout the summer in the face of lowered demands has been surprising. After the Chilean stockpile is sold and its current production enters the market, I feel we shall experience lower prices. In view of this our purchasing policy continues to be conservative with all our copper on contract being bought on an average monthly figure or price in effect on date of shipment.

As a result of small rigid conduit production for the past two months, our third quarter steel orders are more than sufficient to fill our needs through December. Fortunately, most of our steel in inventory was purchased before the last steel price increase. All other materials are in ample supply to meet current requirements.

[fol. 5049]

ROME CABLE CORPORATION

Factory payroll statistics for Rome and Torrance are presented below:

	Week Ending	No. Employees	Total Payroll	Average Weekly Wage
ROME	Sept. 14, 1952	M 1032 F 169 1201	$87,985.40 3,781.98 91,767.38	$85.03 57.88
	Feb. 1, 1953	M 1008 F 118 1126	85,954.74 5,460.17 91,414.91	85.27 46.28
	Aug. 16, 1953	M 1019 F 93 1112	81,260.41 5,473.59 86,734.00	79.75 58.86
TORRANCE	Sept. 13, 1952	149	13,753.67	92.31
	Feb. 7, 1953	153	11,611.82	81.20
	Aug. 15, 1953	150	12,686.04	84.57

E.R's approved since our last Board meeting are as follows:

	E.R. No.	Description	Amount	
ROME	1583	Purchase one Model 1250 Multilith	$2,011	
	1584	Purchase and install an additional concentric taping head on multiple taping machine #61-23	1,600	
	1585	Construct and install two paper humidifying cabinets for Magnet Wire Dept.	800	
	1586	Purchase and install one band saw in Carpenter Shop	1,400	
	1587	Purchase one portable centrifugal gas driven pump	400	
	1589	Purchase and install 5 brazing units for stranders	1,000	
	1590	Purchase and install one electrically heated vacuum drying oven in Laboratory, Item #3	400	
	1591	Purchase and install electrically heated vacuum drying oven in Laboratory, Item #4	400	
	1592	Purchase and install three electric hoists	1,330	$9,341

[fol. 5050]

ROME CABLE CORPORATION

E.A. No.	Description	Amount	
TONAWANDA			
C-204	Make expenditures for 1953 Furniture & Equipment	$2,000	
C-205	Purchase a 9,000 CFM zinc dust exhaust and collecting unit	5,390	
C-206	Purchase one 1951 used "Krane Kar" mobile Swing Boom Crane Model AY	8,755	
C-207	Purchase spray showers, etc. to be installed along the electro-plating line	1,500	$17,645

The following Additional E.A's were also approved:

ROME			
1546-A	Provide for an additional appropriation on cold bend test box	$ 200	
1568-A	Purchase and install 14 Vaughn Fine Wire Drawing Machines	154,000	
1510-A	Extra for high pressure pump and motor	977	
1556-B	Additional for Edmunds High Speed Planetary tripler	725	
1563-A	Additional for two test tanks in Bldg. #20	6,300	
1569-A	Additional to cover cost of a spare blower for bar furnaces	323	$162,325

PROPERZI CASTING AND ROLLING EQUIPMENT

This equipment according to C. H. Ellis, is giving us reasonable satisfaction with a running speed of approximately 1450 lbs. per hour although it was anticipated at the time of purchase that we would secure 2000 lbs. per hour. However, we have ordered equipment to convert our unit to the #5 type which should give us 2000 lbs. per hour capacity. This total change will cost about $2600 including the wheel and changes in the rolling equipment. It is quite possible that we may have to order a larger electric motor for the enlarged production. I believe that as we gain a little more experience in the operation of this equipment we will be able to improve the quality of the product as it comes from the casting and rolling operation.

The Robertson lead press, according to C. H. Ellis, has proven to be mechanically sound but we are having operating difficulties which we find some of our competitors are also experiencing, but we hope will be overcome by technical developments by the Robertson company. The quality of the product from the extruder is excellent.

[fol. 5051]

ROME CABLE CORPORATION

TORRANCE PLANT

In my report to the Board on September 4, 1952 I spoke of the many troubles that had occurred at our Torrance Plant due to delays of furnishing equipment, necessary changes in design and at times lack of steel. In our Annual Report March 31, 1953 I stated, "Evidence is now available that we should begin to get fulfillment of our hopes in production of high quality Rigid Conduit by our new process in the current quarter". I am sorry to have to report that our difficulties encountered in getting the Sendzimer process into satisfactory operation have been varied and many. I will not attempt to go into details. Latest information from conversation that Ross and Charlie had with Art Andersen on August 31, 1953 is indicative of progress and they are both of the opinion that they fully expect by late this week or next week that we will be in production of Rigid Conduit of an entirely satisfactory quality. In fact, Art states that we will have a better quality than any of our competitors and that the cost will, in his judgment, be below the cost estimated by Jay Sarles after his recent trip to Torrance. I appreciate some of these many difficulties and think that Messrs. Andersen and Ellis are entitled to our appreciation for the ingenuity that has been displayed in overcoming some of the difficulties.

The Sendzimer process has never before been put in successful operation on pipe. Insofar as we know we are the only licensee of this process for galvanizing pipe. Our sales have been very low for months past and we have been put in a bad light with our customers owing to our past difficulties. I hope that we will soon be producing such quality that our Sales Department will accept the challenge with enthusiasm and get enough business for us to run at a reasonable profit.

ROME PLANT

Again may I stress that I believe this is a golden time for us to account efficiency, cost and quality, not only of product but of service. Let us leave no stone unturned to overcome some of the difficulties that seem to be particularly inherent in our present rubber production. It seems apparent to me that we have been trying to do too much copper and aluminum insulated cable business in the limited space available for this enlarged production.

FUTURE PLANNING

This seems a very opportune time to press our consideration of what we should be planning to accomplish in the balance of this year and the next fiscal year to overcome some of the difficulties above mentioned by attempting to secure additional space and such equipment as is necessary in order to bring about not only greater efficiency but lowered cost of production. A comprehensive study should also include area market opportunities and a study of the effect of transportation charges to each important sales area on the percentage of profits which might be expected on the various products.

BUSINESS OUTLOOK

Since the first of the calendar year we have been steadily cutting into backlogs and in no week since then has the volume of incoming orders equalled out-going shipments. We believe the lowest level was reached in mid-August, with the unsettled price situation for raw copper and predicted lower prices

[fol. 5052]

for that metal it is natural that policies dictating buying only for immediate needs should prevail. The break in insulated wire prices in July and late August produced further hesitancy until it is determined that the market has reached its bottom level. We expect that business in the last four months of the year will be off by at least 10 to 15 per cent from the first half levels.

WIRE PRICES

Early in July base prices on bare, weatherproof and magnet wire were reduced from 32.10 cents to 30 cents copper base to recognize the change in availability of copper at the 30 cent level. In the same month prices on most standard sheet price items in insulated products were reduced approximately 7 to 8 per cent, with 2 to 3 per cent representing actual copper price reductions. Some of these price reductions ran as high as 15 per cent.

On Monday, August 31, we met further industry reductions of 7-1/2 per cent on most building wire items and 10 per cent on non-metallic sheathed. We believe this is the outgrowth of certain vicious practices, such as extra discounts, price protection, etc. offered to get a larger proportion of the reduced amount of going business.

ALUMINUM

It will be noted our aluminum sales for April-August 1953 as compared with a like period last year show a gain of 78.6 per cent. I would expect that with the present price differential between copper and aluminum that this business should continue a steady growth.

We had a visit from Ralph Davies, Vice President in Charge of Sales for the Aluminum Company, and it was indicated that we would probably continue to manufacture their insulated products at least until the end of March 1955. He indicated that their business for the balance of the year on insulated products would be off about 40 per cent from their original expectations. From their studies they continue to be optimistic for the future on a long term basis on a continued upward use of insulated aluminum products. I believe we should do everything possible in our own equipment layout to bring our costs in line on the production of aluminum insulated products.

INVENTORY

Greater availability of material, unsettled price structure and vicious unrealistic pricing practices of competitors generated the usual demand for increased consigned stocks during the last quarter. As a result of a careful investigation by the Sales Department we accepted their recommendation in the amount of 2,200,000 lbs. of copper in order to maintain our distribution. It is quite obvious in this transition period from a controlled order economy to stock item shipments that our inventories will have to be increased.

SPIRAL FOUR

On April 23, 1953 we filed with the Army Emergency Facilities Board a claim for right to use True Depreciation in our Spiral Four contract, a claim totalling $820,531.18. We have had a visit from three officials from the Pentagon designated

[fol. 5053]

to act as a Board of Inquiry into all claims on Signal Corps facilities and are hopeful to get their decision in the near future. No action as yet has been taken on Renegotiation and our total voluntary refunds and price reductions to date on Spiral Four, under our redetermination clauses, total $4,179,467.30. We still have at issue the matter involved in the claim mentioned earlier, the handling of accelerated amortization.

Our most recent checks with the Signal Corps on Spiral Four indicate that they have funds available in the new budget to cover operations for at least nine months additional or until December 1954. There is some possibility that they may eliminate some of the less efficient contractors. In such case we have been advised that we would have further extension into 1955 but it is doubtful if any increased level of operations can be expected.

LABOR RELATIONS

Our contract with I.A.M. Local No. 1875 representing maintenance workers at Rome Plant required reopening negotiations on April 3, 1953. Due to economic conditions at that time an agreement was mutually decided upon to start our negotiations about August 1st. However, the company offered a wage adjustment which was accepted July 13, 1953 including a five per cent increase to the base rate schedule in lieu of the former 4.46 per cent cost-of-living increases. In addition a 6-cent per hour general increase was accepted. The negotiations eliminated a further reopening clause effective December 3, 1953 so that the present supplemental wage contract remains in force until August 3, 1954. Labor relations continue in a satisfactory, friendly condition.

I am advised that absenteeism in our regular factory, not including Spiral Four, for the year ending June 1952 averaged 2.8 per cent, which figure was continued to the end of June 1953. The regular factory portion of absenteeism due to sickness was reduced approximately 10 per cent last year as compared to the prior year.

MEDICAL DEPARTMENT

Certain minor changes in our Medical Department enabled us to provide for cardiographic equipment, eye examination and hearing tests by audiometer.

CAFETERIA

The quality and variety of food furnished by the Slater System in our Cafeteria has been improved during the past year.

COPPER RECLAIMING SYSTEM

With a total capital outlay of approximately $7,000 we hope to save $40,000 per year on reclamation of copper scale in the new settling system and a saving of about $4,000 per annum in the cost of water.

MOVIE FILM

We had the first showing of our movie film a few days ago and our Sales and Engineering Departments expressed their approval of this film as a good vehicle to use with customers and utility engineers. Might I suggest that we give some thought to obtaining a shorter film, perhaps fifteen or twenty

ROME CABLE CORPORATION

minutes duration, to be used for public relations, such as share owners meetings, etc., etc., which would not go into some of the detail shown in our present film but would give a better impression of the type personnel in our plant and the size and scope of our plant and products.

ROME CABLE FOUNDATION

We have invested $70,561.90 in securities under the advice of Carl M. Loeb, Rhoades & Co. They were very generous and cooperative in advising there would be no charge for this service on account of the fact that Rome Cable Foundation is a charitable organization.

BONUS

I suggest that the list of individuals who share in the bonus be discussed and approved at this meeting and that action on partial payment of the bonus should be left to the judgment of the Finance Committee.

EXECUTIVE BONUS GROUP PLAN

In my report to the directors on June 17, 1953 I suggested that the Executive Group Bonus Plan be studied with the idea of making certain changes in same and that the Committee making such study should report at this Board meeting. The study is still continuing, but I feel under present conditions that it is wise not to undertake any revision at this present time and that probably we will take no action during this current fiscal year.

EXCESS PROFITS TAX

Excess Profits Tax expires under present laws, at the assurance of our legislative leaders, on December 31, 1953 so that we will have the benefit of our last quarter without the penalty of this tax. I believe that this tax in the second quarter of our present fiscal year will cost about 45 cents per share. It has been a very heavy drain on us.

LONG TERM DEBT

Our long term debt now stands at $2,104,000 at September 1, 1953. With the enlarged investment due to consigned stocks and the carrying of more staple stocks in our own warehouses it is quite evident that we may be called upon to do some short term borrowing in the not distant future.

SALES MEETING

Our Sales Meeting will be held on September 16, 17 and 18. I think it comes at a particularly fortunate time in order that we may bring our Sales Department up to date with our thinking and stimulate them to obtain a larger share of the going business wherever possible. I feel that with positive assurance of satisfactory quality of Rigid Conduit and the consigned stocks of E.M.T. that we have already given we should be able to secure sufficient conduit and E.M.T. business to put our Terrance plant on a good profitable basis. That is one of our most important immediate jobs in my opinion.

[fol. 5055]

ROME CABLE CORPORATION

DIVIDEND ACTION

I suggest dividend action be taken at this meeting on our Common Stock, payment to be made to stock of record at September 10, 1953, payable October 1, 1953 at the rate of 35 cents per share of Common Stock outstanding.

Appropriate action should also be taken at this time on employees dividend in accordance with the Employee Dividend Sharing Plan.

Respectfully submitted,

R. P. WIGHT
Chairman of the Board

PLAINTIFF'S EXHIBIT 85

Rome Cable Corporation

1953 Sales Conference

Our Future in Aluminum—G. E. Rolston

Under this subject Mr. Rolston indicated that within the last year some of the companies that intended to use aluminum for different applications had found that it was not feasible from a cost standpoint. This was especially true in the Magnet Wire field and we have experienced a slowdown in demand for this particular product.

However, the use of aluminum as a conductor for overhead use has increased tremendously and by comparison he stated that in 1946 twenty-two million pounds of aluminum was sold for this use as compared to 1952 when some 192 million pounds was sold for overhead use. This growth is exceptional and, while some of it was due to copper shortages, most of it was due to a changing trend of the utilities of the country. ACSR for overhead use has been well accepted and the demand for this product will continue to grow. The demand for aluminum Triplex has increased very sizeably and in view of this we have installed a new high-speed tripler and also a new cold feed CV machine. On this subject Mr. Rolston said there were still too many different types of this particular cable being offered and he asked that we all talk about Rome Cable's standard product and steer our customers toward it. The fewer different constructions we have, the better off we are.

We have announced our activity into the bare aluminum field and, as previously outlined, have necessarily restricted this product to States where the freight is now prohibitive. We are prepared to offer for sale all the distribution sizes in ACSR which includes #4/0 and smaller and all sizes up to 1,033,500 CM-61 strand all aluminum. This should give us a fairly rounded line of bare aluminum and ACSR to offer to our customers. At present, we are limited to .062" as the smallest solid wire that we can draw which means #6-7 strand is the smallest stranded size. We are not in a position to offer aluminum conductor in EC-H26

temper as yet. We will, however, consider selling in any part of the United States if the balance of the job is attractive to us. This will have to be decided by Rome.

Mr. Rolston spoke of the activity in aluminum conductor as far as Building Wire and Cable applies and indicated that the activity in this particular line of products has been limited. Aluminum was first introduced as an electrical conductor for insulated products in 1947 as a Building Wire, but due to lack of connectors and the lack of know-how in handling, it was an unsuccessful adventure. Some manufacturers were burdened with stocks that they could not sell and its popularity was at a minimum. While there has been some activity in the aluminum Building Wire field the demand must be a good deal greater than it is for us to announce this product as one of our line.

[fol. 5057] Aluminum conductor used in Type USE Cable is becoming more popular and may be with us sooner than we think. A few competitors have published price sheets on this product and it will bear watching and he asked for all and any information regarding increased interest from the field.

We are interested in attractive inquiries for any insulated products employing aluminum conductors and these inquiries should be referred to Rome for consideration.

Mr. Rolston recounted briefly the pricing history of Wire and Cables with aluminum conductor and stated that it was more stable today than it has ever been. We have price sheets in our customers' hands on bare aluminum and ASCR, RoLene and RoPrene Weatherproof and also Triplex Cables and he said that when we use these price sheets we should use them correctly and maintain the terms and conditions and discounts as outlined thereon.

With regard to price, Mr. Rolston said that competitive reports show that there is very little consistency in pricing of high voltage cable with aluminum conductor. Our policy is still that we price this material on the basis of substituting aluminum for copper and we think this method of pricing is correct and realistic. However, some of our competitors apparently do not agree with this and we should be prepared for severe and unrealistic competition when dealing with this particular product.

Competition

This subject was discussed in an informal session with a panel consisting of the following District Managers, the text of their remarks is as follows:

Mr. A. K. Buckenmaier—Detroit

Mr. Buckenmaier said that the last few months have been hectic and there have been extra 5 percents and the usual price concessions floating around in his territory. During these times it is especially important to be close to the customer and talk quality and Rome Cable as a company rather than price. It is important that you sell yourself, your company and your product; and it is the only way to overcome price concessions offered by fringe companies.

Aluminum (Bare) and Magnet Wire Developments

Bare Aluminum and A.C.S.R. Conductors

You will receive within a few days a new Product Bulletin covering our new line of bare aluminum and A.C.S.R. conductors. This bulletin covers the size range and constructions which we are prepared to supply at the present time:

1. Solid Hard Drawn Aluminum, #14—2 AWG
2. Stranded Class A Hard Drawn Aluminum, #6 AWG —1,000 MCM
3. A.C.S.R., #6—4/0 AWG

All aluminum wires used in these constructions are Grade EC-19, produced by our Properzi continuous casting unit.

All three types are manufactured in accordance with appropriate A.S.T.M. specifications as shown in the bulletin.

In the case of stranded all-aluminum, we have listed Class A strandings only, and have shown those CM sizes which

we believe will be most popular. In most sizes we can also supply Class AA and Class B stranding if necessary, and also we can manufacture certain intermediate CM sizes if required.

In the case of A.C.S.R., our steel core wires are made with standard A.S.T.M. weight galvanizing. The two heavier weights of coating covered by A.S.T.M. specifications can be supplied upon request.

The range of sizes we are presently offering in ACSR does not cover the sizes generally used for long cross-country transmission lines. They are mostly the sizes used for distribution.

Magnet Wire

1. 3/4 Lap Single Paper

This class of magnet wire has grown in use to the point where it is a major part of our magnet wire production. It is replacing both 2-paper single cotton, and 4-paper constructions. We are currently studying our equipment in the light of this trend, and hope to develop modifications which will improve both quality and efficiency.

In this class of magnet wire there has been some confusion as to the meaning of the Price Sheet statement that 1% shall be added to the price for Bonded Paper. Bonded Paper Magnet Wire is a separate class of paper magnet wire which we do not manufacture. We do, in most cases, use an adhesive to keep the paper from slipping on the conductor, but this is not Bonded Paper.

[fol. 5059] 2. Within a few months you will probably receive an announcement from us relative to manufacturer's identification of our product. We have been working with one of our customers for about two years in an effort to develop a means for identifying our product as material made by Rome Cable. We now have on order equipment for indenting the copper with the letters "RC" at six inch intervals. We believe this is a feature which all of our customers will appreciate, and, therefore, plan to so identify all covered rectangular shapes and all covered square wire larger than #8 AWG. You will receive a notice to this effect when we are ready to go.

3. Glass Magnet Wire—Small Sizes

In response to many requests from you over the past several years, we notified you on May 7, 1953 that we were prepared to supply Round Glass Magnet Wire in sizes down to #22 AWG, thus extending our previous limitation of #14 AWG as the smallest size we could supply. This required a great deal of work by Plant Engineering, Laboratory, and Production, and also required building and installation of new equipment. We have yet to receive our first order for magnet wire to utilize this new equipment, and it is standing idle. We believe you should try a little harder to get us orders in this size range.

4. Silicone Glass Magnet Wire

This class of magnet wire was first introduced by us in 1950. It is rated as a Class H material, suitable for use subject to "hottest spot" temperature rating of 180°C. This compares to 130°C for standard glass magnet wire, which is a Class B material.

The use of Class H equipment is growing slowly. There are many problems faced by equipment manufacturers in construction of Class H equipment, and suitable magnet wire is only one of them. Our Silicone Glass Magnet Wire is a product we can all be very proud of. Based on my own personal observation, I believe it is the best on the market. By use of the best varnishes available, applied carefully, and with proper control of the bake, we are supplying a product not yet equalled by our competition. We have one or two large users who will buy this class of magnet wire only from Rome Cable.

5. Aluminum Magnet Wire

Engineering studies by several transformer manufacturers a few years ago indicated that the use of glass covered aluminum magnet wire should make possible savings in the manufacture of dry type transformers. One of our customers went into the manufacture of dry type transformers using rectangular aluminum with glass covering, on a large scale. One or two others are either studying the application or trying it on a small scale. At the present

time, these manufacturers have found that additional fabricating costs in their plants may equal or exceed the anticipated savings. This is largely due to the techniques now necessary for making electrical connections and the need [fol. 5060] for more mechanical support of the coils. The manufacturer who was in large scale production has, for the present, abandoned this production in order to study the matter further. We do not know whether or not this product will find a permanent place in the electrical field. In the meantime, you should remember that we have made more of this material than any other supplier, and are ready to produce it if required. We have accumulated a fine background of experience with this product which is available to your customers.

6. New Materials

There are many new covering materials for magnet wire being offered and discussed. Most of them are for Class B or Class H applications, are supplied in tape form, and are quite expensive. Such materials as Mylar, and Quintena-Mylar are being strongly promoted by some manufacturers. We are familiar with these materials and in many cases have made samples of magnet wire for test. In the case of Quintena-Mylar, we have supplied small quantities to one customer. In discussing these materials with our major magnet wire customers, we have not found any promising applications as yet. Please keep in mind that we are trying to keep up to date on these matters. If you learn of interest in these materials keep us posted and if you need information on them, let us know.

Plaintiff's Exhibit 88

ROME CABLE
CORPORATION

ROME, N.Y.

REPORT SUBMITTED TO THE BOARD OF DIRECTORS OF ROME CABLE CORPORATION AT THEIR MEETING MARCH 3, 1954

I present herewith net sales and earnings by fiscal years up to March 31, 1953, and by quarters for the current year and the month of January:

Fiscal Year Ended	Net Sales	Earnings
March 31, 1937	$ 1,798,092	$ 1,616
March 31, 1938	4,957,103	71,027
March 31, 1939	5,370,665	245,036
March 31, 1940	6,080,902	297,736
March 31, 1941	9,465,451	431,501
March 31, 1942	11,631,785	592,135
March 31, 1943	12,712,333	367,654
March 31, 1944	16,909,735	466,709
March 31, 1945	22,798,218	486,653
March 31, 1946	16,975,009	398,973
March 31, 1947	18,436,305	1,359,593
March 31, 1948	25,202,853	1,152,579
March 31, 1949	26,088,523	1,115,960
March 31, 1950	19,602,984	302,209)
	Add: Portion of metal profits set aside in prior years to offset copper loss	150,000) 452,209
March 31, 1951	35,142,901 Net	$1,922,136
	Transferred to earnings retained	150,000 1,772,136
March 31, 1952	42,657,848	1,753,651
March 31, 1953	54,632,976	2,008,321
April - June Quarter	13,858,372	524,190
July - September Quarter	10,732,248	409,129
October - December Quarter	10,262,761	325,676
Total Nine Months	34,853,381	1,258,995
January 1954	3,159,076	80,567

[fol. 5062]

ROME CABLE CORPORATION

EARNINGS

While our earnings for the third quarter dropped $84,000 below the prior quarter we must recall that the July-September quarter was improved by $120,000 due to reduction of tax rate to 65.5%. Sizable price declines in building wire items adversely affected any comparisons for the prior periods.

Despite the increased sales in January net earnings for that month just equalled December due to further price declines and the fact that in December we included a sizable inventory pick-up in Spiral 4. Therefore earnings will show a drop in the current quarter due to reduced volume and poorer prices. Our earnings for the year should approximate $3.00 per share compared to $4.01 in the prior year and $3.58 in the year ended March 31, 1952.

Looking ahead for the first six months of the new year, while we will run out of the Spiral 4 program in the first quarter, we should see considerable improvement in the Torrance picture and our tax percentage will drop to 52% compared to 65% in the current year. If we assume continuation of the present volume, we will not produce as satisfactory earnings for the first six months of our next fiscal year as in the same period of 1954.

SALES

While January showed about a 10% increase in sales above the low of December it was expected that the total for the quarter will run about 10% behind the October-December period, with a total for the year approximating $44,000,000 or 20% behind the previous year. More than half the decrease is accounted for in difference in Spiral 4 sales in the two years. Lower prices for insulated products account for several hundred thousand dollars more.

The breakdown of sales for the past ten months compared with a like period in the previous fiscal year shows the following:

	April 1953 Jan. 1954	April 1952 Jan. 1953	% Increase or Decrease
Rods	$ 4,273,337	$ 5,637,747	(24.3)
Bare	5,355,194	5,027,825	6.5
Weatherproof	2,248,070	2,765,402	(18.8)
Magnet	2,656,949	2,855,951	(7.0)
Rubber Covered	15,216,317	17,390,208	(12.6)
Torrance -E.M.T. (Incl. T.V. Mast)	2,213,848	1,793,250 [EMT]	23.5
" -Rigid	453,499	805,895	(43.8)
Spiral 4	5,293,894	10,699,954	(50.6)
Aluminum	1,993,541	1,327,892	50.1
Total -Rome	37,037,302	45,704,979	(19.0)
" -Torrance	2,667,347	2,599,145	2.6
GRAND TOTAL -	$ 39,704,649	$ 48,304,124	(17.8)

( ) Red.

[fol. 5063]

ROME CABLE CORPORATION

BACKLOGS

Our backlogs continued to decline throughout the entire year 1953 and continued so into January of 1954. This condition has been reversed in February and we are pleased to report that on wire and cable and aluminum items incoming orders to date have exceeded shipments for the first time in seventeen months.

Backlog figures of a year ago, August 31st and the latest figure for the current year are shown below:

		Quantity	Value
February 21, 1954 -	Wire & Cable	4,026,000 #	$ 2,406,000
	Aluminum	578,000	312,000
	Spiral 4	197,000 pcs.	1,100,000
	Torrance	1,090,000 ft.	127,001
August 31, 1953 -	Wire & Cable	7,417,000 #	4,705,000
	Aluminum	466,000	388,000
	Spiral 4	678,000 pcs.	3,782,000
	Torrance	3,339,000 ft.	381,420
February 21, 1953 -	Wire & Cable	11,592,000 #	8,585,000
	Aluminum	1,148,000	920,000
	Spiral 4	1,298,000 pcs.	8,112,000
	Torrance	1,695,000 ft.	275,439

COPPER

Despite our feelings to the contrary the price of copper has continued at around the 30 cent level. Informed opinion seems to feel that it will stay around that level until late March, owing to the fact that the Chilean Senate failed to ratify contract for sale of approximately 100,000 tons to the United States stockpile and tax agreement with the United States companies on new production. We continue to feel that the price of 30 cents is too high and reduction to around 25 cents should stimulate business.

OTHER MATERIALS

We are overstocked with steel for Rigid at Torrance owing to production not living up to earlier schedules because of difficulties of the hot dip furnace. It will take several months to bring this into balance. Steel is now available on near-term shipment. This condition also prevails with all of our other materials.

INVENTORY

We are bending every effort towards bringing our copper inventory into balance of approximately 11,100,000 pounds, which is our LIFO base.

Physical inventory was taken at the Rome plant at the end of January and preliminary reports indicate satisfactory results.

[fol. 5064]

ROME CABLE CORPORATION

LABOR

Figures covering factory payroll are shown for representative weeks in the last year as well as total number of salaried employees for the same period.

	Week Ending	Employees	Total Payroll	Avg. Wkly. Wage	Avg. Hrs. Worked	Number Salaried Emp
ROME	2/21/54	M 958	$ 70,879	$ 73.99	38.4	
		F 69	3,912	56.70	35.6	418
		1027	$ 74,791	$ 72.83	38.2	
	8/23/53	M 1017	$ 83,003	$ 81.62	41.1	
		F 93	5,560	59.79	37.0	
		1110	$ 88,563	$ 79.79	40.8	411
	2/22/53	M 995	$ 90,718	$ 91.17	45.4	
		F 119	6,950	58.41	37.4	
		1114	$ 97,668	$ 87.67	44.5	397
TORRANCE						
	2/13/54	149	$ 12,216	$ 81.99	38.3	30
	8/22/53	148	$ 12,528	$ 84.65	38.3	34
	2/14/53	141	$ 11,073	$ 78.53	38.5	28

You will note from the above the drop in average hours worked at Rome of over 6 hours per week from a year ago and a drop of about $14, as well as a decline of almost 100 in number of employees at Rome. Our number of salaried employees, however, has increased from 397 to 418 and we believe that this is a subject for very careful review in the light of current conditions.

CAPITAL EXPENDITURES

E. R. 's approved since the last meeting of the Board of Directors:

	E.R. No.	Description	Amount
ROME	1601	Provide appropriation for Furniture & Fixtures for Rome Plant, second half F. Y. 1953	$ 5,000
	1599	Purchase a parcel of three lots on the southerly side of Henry St. and also a parcel of three lots on South Jay St.	33,000

[fol. 5067]

ROME CABLE CORPORATION

For the current fiscal year our capital expenditures will approximate $650,000, while total depreciation of $540,000 and accelerated amortization of $161,000 should total $701,000. As of March 31, 1954 we will carry over in approved expenditures approximately $135,000 to be paid for in the first quarter of the new fiscal year.

Our problem today is to review carefully the requests of both plants and discuss a program for the new fiscal year. Our factory managements at both Rome and Torrance have answered our request for potential requirements, and they have indicated a need for approximately $567,000 at Rome and $65,000 at Torrance. This is within the yearly depreciation and accelerated amortization accrual. However, there is much that should be discussed on expenditures that would improve layout, reduce costs and provide some additional capacity where needed for the future.

With the expiration of the Spiral 4 contract in May best utilization of that building can only be had by closing Henry Street and joining the Spiral 4 building to our present insulating building. We have had under considerable investigation a new scrap disposal proposition and have carried on some investigation of potential volume in telephone wire. I believe we should hear from our three Vice Presidents, Messrs. Ellis, Schatzel and Rolston as to the urgency of some of the matters suggested for executive consideration in the factory management requests for capital expenditures. In any program of going beyond our depreciation charges consideration must be given to providing new money for this purpose. The Mills plan requiring payment of 90% of our tax bill in the first six months of our new fiscal year creates a heavy drain upon our cash and could well mean short-term borrowing. I would like to have a full discussion of this subject, particularly regarding the form or means of raising the money as well as the wisdom of embarking on such a program at this time.

I believe it is imperative that we proceed with a request to the City Administration to close Henry Street. Preliminary conversations with Mr. Hinman of Rome Strip Steel have not been entirely satisfactory and he may not be very cooperative.

I feel that at the present time, we should stop, look and listen before committing ourselves to the larger expenditures indicated in C. H. Ellis' first report headed - "For Special Executive Decision." I believe that between now and our next regular quarterly meeting, we shouldhave more knowledge on several very important matters, including the answers to such questions as:-

(1) Will ALCOA continue on a satisfactory basis with us?
(2) Will the City approve closing Henry Street?
(3) Will price of copper be stabilized?
(4) Has the situation by then sufficiently clarified so that we may know whether we are facing a larger recession than I now anticipate?
(5) Is our Torrance operation on a satisfactory basis?

[fol. 5068]

ROME CABLE CORPORATION

CAPITAL EXPENDITURES -Cont'd

I believe that we can judge the balance of 1954 fairly accurately within the period between now and our next quarterly meeting. Until the above matters are clarified, I would hesitate, in fact, I would not be in favor of the larger program mentioned in Mr. Ellis' report. After these matters clear up, and I have further knowledge re financing and more information on certain parts of the expenditures, I shall then be prepared to vote such amounts as seem proper under the circumstances.

LONG TERM LOAN

With our payment of $206,000 on our long-term loan, on January 1st, the debt was reduced to $1,899,000. Because of the indicated very heavy drain on cash in the new fiscal year and possible needs arising out of potential capital expenditures, Mr. Fraser explored with J. P. Morgan and Co. the possibility of increasing the loan by $1,000,000. They in turn checked with Connecticut Mutual and had a prompt response that they would be very glad to arrange for such an increase.

PRICES

The highly competitive price situation reported in my last letter shows further deterioration. Two additional price cuts on building wire items since our last meeting now bring the accumulative total to approximately 40% on many items since last July 1st. Most items of building wire are now being sold below cost, with reports reaching us that additional discounts are being offered as well as other special inducements, such as price protection for extended periods. Price reductions have extended into other fields such as power cable, and we have found it necessary to review manufacturing practices and margins on all sizable inquiries in order to maintain our customer relationship and proportionate volume.

ALUMINUM

Our aluminum volume continues to grow satisfactorily. Sales for the first ten months of the current year are 50% better than a year ago. Dollar volume of our own sales in the two periods was up 43% and our toll 28%. In the calendar year 1952 we processed approximately 1,600,000 pounds of aluminum which figure climbed to over 3,500,000 pounds in the calendar year 1953. At the January rate of shipment 1954 could exceed 5,000,000 pounds. Copper contents of insulated products shipped in November, December and January totalled 3,600,000 pounds and aluminum a little over 1,000,000 pounds, or approximately 3,000,000 pounds of copper equivalent. If our shipments of copper insulated products should return to more nearly normal levels and aluminum should continue its growth, it is quite evident that our insulating capacity would soon be taxed to its limit, and this matter should be given consideration at this time in our review of capital expenditures at this meeting.

In the calendar year 1952 we used 824,000 pounds of aluminum for ALCOA and in 1953 this climbed to 2,010,000 pounds. In January the total aluminum content of shipments equalled 278,000 pounds. I believe it is important that we should make an early review with ALCOA as to their current thoughts, and we should be prepared to come up with our best prices and ability to perform to meet their needs since I feel this is desirable business.

[fol. 5069]
ROME CABLE CORPORATION

ALUMINUM -Cont'd

We have produced over a million pounds on our Properzi equipment. Production was coming along in quite satisfactory fashion until November when a variety of troubles on both the casting and rolling equipment beset us. Important design changes have been made during this time, and we hope to resume experimental runs this week. During this down period we have been purchasing rods from ALCOA to meet our own requirements.

TORRANCE

Many things have happened at Torrance since my last report. First, Art Andersen has resigned as Vice President and General Manager of the Torrance Plant as of December 31, 1953. Mr. Gilbert Woodill was appointed Acting Manager, and I am pleased to report excellent cooperation by the organization at Torrance as well as a good approach to the solution of many of its problems. Steps have been taken that will provide competent administration for the plant in the near future.

On February 1st hot dip galvanizing unit was shut down to make the necessary changes for efficient production. These have been completed, and trial runs are being made at the time of the writing of this report and will be reported verbally at the meeting. Satisfactory arrangements have been made with Pittsburgh Standard Conduit Co., Pittsburgh, Pa. to sell us sizes larger than 2", which gives us a complete line. This is a further incentive for our Sales Department, and with the high quality of our product our sales should climbsteadily. Efforts can now be further directed at cost reduction and maintenance of quality. We have added a sales promotional man, Mr. Ufer, formerly head of the Underwriters' Laboratories inspectors in Los Angeles which should help our Sales Department.

Electric Furnace Company paid us $20,000 to cover work we had done to complete the furnace. We have also had one meeting with Electric Furnace and ARMCO Steel representatives having in mind potential development of the Sendzimer process, including some potential patents that we may have, that should eventually raise the standards for rigid conduit and be beneficial to all three companies.

Facilities are badly needed for warehousing finished material at Torrance, and I hope we can have a preliminary discussion on this subject. However, such a major expenditure should be deferred until our manufacturing problems on rigid are finally solved.

SPIRAL 4

Much has happened regarding Spiral 4 since our last meeting. At that time we had expected to be continued in the program at approximately the same rate as the then current production of approximately 4,000 lengths per month. As of now, when we complete the present contract in May our part of the program ends. Briefly the story is this.

[fol. 5070]

ROME CABLE CORPORATION

SPIRAL 4 -Cont'd

In late December the Signal Corps asked all six contractors to bid on portions of a total program about equivalent to ours alone. We were awarded half of that program. Before actually receiving the order the schedule was cut in two and new bids asked. Other contractors having had our prices made available to them under-cut us by approximately $2.50 per length. Despite the fact that we had refunded or reduced prices to the extent of over $5,000,000, or 20% of our original contract, and had the best record on quality and delivery performance of any of the contractors, according to the Military, we were dropped as a supplier. We are making a vigorous protest to Washington concerning the unethical handling.

Steps are being taken to get disposal of the equipment and integrate the building into our other operations. We are very proud of the job that our organization has done on this important development of a part of our Country's defense requirements. We sorely regret the necessity of breaking up an organization that made so many fine records and whose productive results earned the esteem of all who came in contact with it, except evidentally the Procurement Officers of the Signal Corps. If the handling of our Spiral 4 contracts is representative of what is happening on other large programs for our defense it is a frightening thought.

Our President went to Washington on Monday and conferred with General Conrad, head of Procurement for the Signal Corps, on the future of Spiral 4 requirements. He was advised that no further program is contemplated for the current year, so we should proceed with the removal of Government facilities as soon after the contract is completed as is practical.

REDERMINATION

We have finally received modification letters from the Signal Corps on our Spiral 4 contracts agreeing to fixed prices on all of the contracts, which we agreed to accept in lieu of our True Depreciation Claim. Messrs. Sarles and Weiss are to be highly complimented on their excellent and alert handling of this matter.

RENEGOTIATION

Our comptroller, J. T. Sarles, has had a first meeting with the Renegotiation Board in Boston and has been asked to prepare additional data. We plan to pursue this vigorously in an effort to get all renegotiation cleaned up at least through March 31, 1953.

INVESTMENT IN SYNTHETIC RUBBER PLANT

In December we were approached by Simplex Wire & Cable Company to join with several other wire companies and other rubber fabricators to organize a potential company to make a bid on one of the RFC Synthetic Rubber Plants. This is just in the process of being organized. After careful study by the Executive Committee it was decided that protection of the supply of synthetic rubber was important for our future planning and that we should carefully analyze the proposal which could mean an investment of approximately $100,000 by us.

[fol. 5071]
ROME CABLE CORPORATION

MOVIE

Our movie has been completed and has had several showings with very favorable results. This movie is largely for use by our Sales and Engineering Departments. The present movie runs approximately 45 minutes and is too long for general public showing. We have been working with Loucks and Norling and have their proposal on a 20 minute version of more public relations appeal. An outline of the script has been submitted to us and looks favorable, and I recommend that we authorize the production of such a movie at an estimated cost of approximately $20,000.

ADVERTISING BUDGET

The quality of our advertising has steadily improved, and we spent approximately $200,000 in the current fiscal year. A budget for the new year of approximately $225,000 will be presented to the meeting for consideration. The major portion of the increase will be spent for product promotion.

ROME CABLE FOUNDATION

In our 1951 fiscal year we appropriated $50,000 to found Rome Cable Foundation and added another $75,000 in the next fiscal year. Total contributions, including $7400 for scholarships, will run about $40,000 through March 31, 1954, leaving us about $85,000 at the end of the current fiscal year of which approximately $70,000 is invested. Our program on scholarships will expand still further during the current year. In line with our desire to build the Foundation so that income could carry on a goodly portion of its work I recommend that we discuss amount of appropriation for the current year and that instructions be given to the Finance Committee to act before March 31st.

CONSULTANTS

For about two years we have had an arrangement with Dr. Winding of Cornell University to act as Consultant on special research on rubber. This has been highly satisfactory. For about the same time we have had an arrangement with J. C. Ward, Jr., now President of Vitro Corporation, which has also been stimulating and productive. In January we engaged Dr. T. Fuller, retired Chief Metallurgist for General Electric Company, who will give us three to five days per month in the field in which he is so well versed - metallurgy.

DIVIDENDS

For several years it has been customary at this meeting to consider declaration of an extra dividend when earnings warranted it. For the entire fiscal year to date we have been on a regular rate of 35 cents per quarter, which if the same rate was declared at this meeting would make payment of $1.40 in the current fiscal year. We consider in view of current business conditions it to be unwise to declare any extra at this time but feel that the payment of $1.40 for the year is modest in relation to the expected earnings and so recommend payment of 35 cents on March 30th to holders of record March 10th. Payment should also be made to the employees under the Employee Dividend Plan at the same time.

[Vol. 5072]

ROME CABLE CORPORATION

EXECUTIVE BONUS

We disbursed $100,000 of the Executive Bonus for the year in December. I recommend thatmother $100,000 be paid after this meeting and depending upon the conditions prevailing and results of February operations and inventory check-up that another $50,000 be left discretionary with the Finance Committee for payment before March 31st.

OUTLOOK

While many of the national indices continue to decline our incoming orders seemed to reach the bottom of the decline in the latter part of December and since that time have been showing an encouraging up-trend. I believe that volume in the first quarter of our new fiscal year should show a 10 to 20% increase above the last quarter of this fiscal year, in physical volume but not dollar value.

Respectfully submitted

H. T. Dyett
CHAIRMAN OF THE BOARD

[fol. 5073] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 90

To: H. T. Dyett
From: R. A. Schatzel
Date: June 7, 1954
Subject: Engineering—Research and Development

Dear H. T.:

This year has been characterized by a rapid change in supply of materials and in intensified competition to sell those materials, as well as competition in our own field. More critical demands of quality and service have been paralleled by the impact of the introduction of new or improved materials, the result of Research in many fields.

On the whole our company has met the challenge and in some areas assumed a position of leadership. In none have we lost a position of contention.

Engineering

Increased recognition of our company among Engineers in the many fields our products enter, such as utilities, industrials and Government, including the Air Force, Navy, and Signal Corps has continued.

Within Industry Technical organizations such as IPCEA, ASTM, ASA, and Underwriters' Laboratories, many new specifications for materials and methods were adopted by Committees representing both Consumer and Producer on which our representatives were in most cases Chairmen, or took a leading part. These are mentioned as evidence of acecptance of our company's position in the Technical Field we are part of.

Research and Development

We are continuing a program of development on Synthetic Rubber under Dr. Winding at Cornell. This is a fundamental study and development of broad background for development. In our own laboratory careful screening of new materials and where warranted, intensive investigation has been carried on.

Butyl Rubber insulated cables have become a regular product and extended application is rapidly progressing.

Silastic insulations have been improved and are being recognized in the industry.

Plastics with improved properties have been developed and find their application in oil fields, appliances and industrial uses. Typical of these are new products—FlexAll a plastic underground cable and Building wire as well as Cathodic Protection Cable and Polyethylene Mine Power Cable.

[fol. 5074] A few years ago hot and cold Arctic Rubbers were a somewhat humorous curiosity; during the year considerable cable was made and approvals received on a broad group of Government constructions.

New and improved form of Polyethylene is extending its use in the Power and particularly the communications field. Expanded Polyethylene for Communication Cables challenges old uses of paper.

With the extension of Automation which has been going on for many years, Control Cables are the nerves of such a system. We are established in this field. Our real participation in it depends on our ability to furnish multiconductor types.

Many new requirements are presented to us, and new tools for their evaluation developed. Radio-active isotopes are becoming and important tool in industry for investigation and control. We have followed this development for some time, and are having personnel trained in the techniques of handling, and familiarity with the use of such materials.

Aluminum—

Much could be written on this. Aluminum is established in the insulated electrical conductor field and it is fair to assume its use will grow rapidly, particularly in those applications where space is not a primary factor.

Our development of casting has progressed satisfactorily. Control of metal purity, determination of proper temperatures and their regulation; selection of materials and methods of operation all have been improved. Fur-

ther improvement is required, but at this date we believe two conclusions can be made:

(a) The Properzi Casting Process is practical.
(b) A product meeting the requirements of industry can be made.

Improvement in design of equipment, furnace, casting wheel and rolling mill is to be expected and required, for a completely satisfactory production unit.

[fol. 5075] Patents

Results of prior development have resulted in patents issued to us and several other applications in prosecution. We have licensed The Standard Machinery Company on a Splice Box for extrusion machines covered by a Rome Cable development.

The Duffy patent on Spark testing of cables has been issued and several companies are interested in licenses.

We are working with Armco and Electric Furnace Co. to obtain coverage of our Torrance process of producing Rigid Conduit.

Student Training

While this may not properly be a part of this report, I believe it pertinent. Due to extreme competition for technically trained graduates and the fact that the supply of G.I. students has run out, difficulty in recruiting suitable candidates is increasing. A review of our practice in training will be necessary. It is probable that the supply of technically trained personnel will not improve until after 1960.

Quality and Inspection

As previously mentioned, a higher level of quality and service has been demanded by our customer. This is a buyers market. We cannot inspect quality into a product —it must be built there. More stringent inspection has been exercised and increased product evaluation testing has been instituted by our Inspection Dept. With the full cooperation of Production and, at their request, an exten-

sion of the statistical quality control program, so well worked out in Spiral 4, is being made to our insulating processes. The general level of quality in the industry has been raised. Rome Cable has maintained a high ranking for dependable quality, despite a few instances where the appearance of our products were criticised. These have been corrected.

Very truly yours,

R. Schatzel.

Plaintiff's Exhibit 91

7/8/54

HTD:AS

Meeting July 7, 1954

"Whither Goest Thou"—Continued

Present: Val, Glenn, Jay, Charlie, Jack, Harry, Rudy, Ross and myself.

With a few opening remarks by H.T., Charlie was called upon to explain the program which we will consider today. He carefully went over the proposed changes in the department and indicated his hope that we erect a new building of approximately 100,000 sq. ft. at an estimated cost of $450,000 to be used for shipping and storage. The building will lie east of Bldg. #20 and west of South Jay Street. This will give us excellent trucking facilities and keep our trucks far from congested areas. This would release Bldg. #20 so that the upper floor could be used for an additional manufacturing space for the Rubber Wire Department. This space would permit of approximately a 40 per cent expansion in our rubber manufactured output. The essential equipment that we would plan to order at the present time contains the following large items:

Lead Extruder	$80,000
One large extruder for either rubber or synthetic	35,000
One Larmuth	40,000

Drawing machine for copper, releasing one of the present copper machines to be used for aluminum	40,000
Cabler	70,000

It is Charlie's opinion that the total equipment to be ordered would be approximately $700,000. With this equipment and rearrangement we would be able to increase our capacity by at least 10 per cent, mostly in power cables. He figures an annual saving due to rearrangement of the department, largely accounted for in our traffic, at $300,000 to which would be added the additional profit due to enlarged operations of $100,000, or a total before taxes of $400,000.

[fol. 5077] After considerable discussion by everyone in attendance Rudy finally made the comment, "The program looks good. We must make larger sizes and longer lengths to satisfactorily serve our customers. Control cables are a growing market. The tendency is towards higher voltages, particularly in the use of improved plastics." In the comparatively near future he sees the prospect of greater use of Butyl. He definitely believes that Butyl will eventually supersede oil base cables. All manufacturers at present are having trouble with Neoprene. The percentage of plastics compared to rubber insulation is constantly growing.

Charlie brought up the question of a large closer and a six wire bay for 16 inch reels—approximate cost $70,000. Rudy: The above would be desirable on communication cables.

Rudy: Magnet Wire—The use of Magnet Wire in electronics, flat, square and down to #30 will continue to grow. He stated that he believes we could make and offer a plastic insulated Magnet Wire with a two mil insulation which would equal enamel and double cotton.

Charlie: Should we attempt to go to one million C.M. C.V. cure? He stated that General Electric are extruding wire vertically which overcomes certain difficulties on the larger sizes. It was thought that we should attempt to go to 500,000 C.M. if possible.

Ross and Glenn discussed P.D's shipping bare wire on 1,000 lb. reels. If we determine to do this we would have

to purchase from 200 to 400 reels. Glenn says there is a strong customer demand for larger packages.

Ross spoke of the pricing situation on ACSR and asked the question whether we should consider ACSR in connection with our Properzi equipment. Glenn thought that we might be able to dispose of 250,000 lbs. of aluminum wire per month. Ross said we should like to be able to offer ACSR. Glenn: Yes, on a limited basis and up to 500 C.M. it would help our sales picture as we could then offer ACSR with insulated aluminum cables in car lots. This he believed would enable us to eventually work up to [fol. 5078] 250,000 lbs. per month of aluminum wire to be used in our own aluminum sales.

Glenn discussed control cables which are a big factor in industrial plants today. The plants are buying through jobbers. They are not conscious of quality. The trend at present is towards plastic. The prices are below the prices we are offering. We should strive to manufacture Butyl on C.V. equipment at least up to 4/0, or possibly up to 500 C.M. All our competition is C.V. insulated. We are "behind the game." The trend towards Polyethylene is very fast. We have experienced so much of delays, reruns and repromises that our boys in the field have taken a hell of a beating and their morale is very low.

Ross raised the question, is aluminum building wire out? Glenn: Do not expect it will grow unless the splicing difficulty is solved. Rudy: Says he believes sizes #1 and larger are okay because they would be installed by expert electrical contractors, but the smaller sizes where the plant electricians would handle them would cause trouble and all thought we should not offer them for sale.

Rudy said he believed our building and equipment plans should be approved. Harry stated he thought the cost of our plan was justified if we can improve efficiency and cut costs. Glenn made the statement that 62 per cent of our sales last year were in New York and contiguous states. Jay thought for a short time perhaps we could defer building. Charlie explained why he did not agree with this and felt the building was essential.

H. T. asked the question, are any new products in the minds of any of you? Jay: How about assembles? Char-

lie: From our past experience I think it is out of our line. Jack: How about plastic pipe? Rudy: At present no standardization. ASTM are studying the matter. Believe we should keep our eye on it, but not favorable at present. Glenn: Thought we should look into armored cable up to 3 inch diamenter. Equipment is made by Sleeper-Hartley. He suggests we get cost on equipment. This was discussed [fol. 5079] at some length and it was agreed that this was worth looking into. Ross: How about some of our products on which we have lost ground? What can we do to build back? Charlie: Spoke of instrument wire and thinks we can get costs down to make us competitive. Glenn: We are about 7 per cent high on instrument wire. Unless we get costs down we will lose business. Last year amounted to about $700,000. Charlie: Think we can bring our costs down. It was decided Charlie and Jay should study costs and labor rates. Glenn: Airport Lighting Cable. Our speed of insulation is from ½ to ⅔ the speed of our competitors which makes our cables high priced. He thought we should check very carefully on what we could do on 5,000 volt airport lighting cable. Jay to estimate costs. Rudy: Think we should take order for experience. Large orders are being placed. Glenn: Brought up Navy cordage. We are losing out because of prices. H.T. Fundamentally he thinks it bad business to lose our position with good customers like Boston Edison and people of that type. As a general thing it has been his experience that when a plant runs fairly full it makes money even if it has to take some business at exceeding low prices. At a time like this he felt it wise to meet the situation and keep in the customers' good graces and work towards bringing our costs down. He thought it was very important not to slip on any of our good products. Ross: We are meeting competition as far as possible.

Ross gave a little discussion on the loan that we are in the process of making, stating that the cost of the plant changes were estimated at $1,100,000. Our depreciation is now running $700,000 which would provide all but $400,000 or $500,000 over the depreciation for the proposed building and rearrangement. Our finances are satisfactory. He thinks that the rearrangement of the plant is very vital.

Upon each person being called on to vote approval or disapproval the vote was as follows:

Rudy	Yes
Jack	Yes
Charlie	Yes
Ross	Yes
Harry	Yes
Glenn	Yes
Val	Yes
H.T.	Yes

[fol. 5080] H.T. then discussed the fact that "merger" seemed to be in the air and a good many companies were merging or considering it because they desired to get greater diversification. He suggested that we give some thought to this matter at this meeting in a purely informal way and state if we so desired both the advantages and the disadvantages. He thought we should consider it very largely from the stockholders angle, as we were the trustees for the stockholders and we should carefully study in our own minds what effect future action might have on their stock.

Ross: He is aware of the difficulties of even one extra plant. We have learned that at Torrance. He thinks that it would be much easier to operate as we are rather than to go into a merged company with one or two other organizations. Glenn: Thought we could build up some of our present lines more than we have. He brought up the question of the flat business he hoped we can develop with the Rome-Turney Company. He thinks we can expand our own business along our present lines. By good hard sales and engineering we can aid our position with a number of our customers.

Ross asked, how about aluminum? Glenn: Said he did not think we could build our ACSR sales very large from Rome plant. He thought Chattanooga was a much more favorable location. Rudy gave his ideas very clearly on the idea of merging with anyone by the statement he had never seen a merger "without a lot of indigestion." Val said, let's stay as is. Jack: Think we all do not care for merger. We might, if the opportunity offered, take over a small plant some time which would not upset our own

organization. Charlie: Think we will find plenty of opportunity in our own business. Harry thinks we should listen but go very slowly.

[fol. 5081] It was very evident that the feeling was quite unanimous that we have plenty of opportunities in our present business and that it seemed undesirable to give any thought to merging our business by joining other companies.

[fol. 5082] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 92

ROME CABLE
CORPORATION
ROME, N.Y.

REPORT SUBMITTED TO THE BOARD OF DIRECTORS OF ROME CABLE CORPORATION AT THEIR MEETING SEPTEMBER 8, 1954

The figures on net sales and earnings for all prior years ending March 31, 1954, as well as the April-June quarter, the month of July and estimated figures for August are given below:

Fiscal Year Ended	Net Sales			Earnings
March 31, 1937	$ 1,798,092			$ 1,616
March 31, 1938	4,957,103			71,027
March 31, 1939	5,370,665			245,036
March 31, 1940	6,080,902			297,736
March 31, 1941	9,465,451			431,501
March 31, 1942	11,631,785			592,135
March 31, 1943	12,712,333			367,654
March 31, 1944	16,909,735			466,709
March 31, 1945	22,798,218			486,653
March 31, 1946	16,975,009			398,913
March 31, 1947	18,436,305			1,359,593
March 31, 1948	25,202,853			1,152,579
March 31, 1949	26,088,523			1,115,960
March 31, 1950	19,602,984			302,209
		Add: Portion of metal profits set aside in prior years to offset copper loss		150,000
				452,209
March 31, 1951	35,142,901	Net	$1,922,136	
		Transferred to earnings retained	150,000	
				1,772,136
March 31, 1952	42,657,848			1,753,651
March 31, 1953	54,632,976			2,008,321
March 31, 1954	44,114,825			1,637,787
April - June Quarter	9,641,198			235,299
July	2,213,645			8,197
August (Est.)	3,211,000			82,000
July-Sept. Quar. (Est.)				210,000
1st & 2nd Quar. (Est.)				445,000

[fol. 5083]

ROME CABLE CORPORATION

The breakdown of sales before deduction for discount and freight for April to August 31, 1954, with August figures estimated, are given below:

	April-August * 1954	April-August 1953	% Increase or (Decrease)
Rods	$2,068,000	$2,614,631	(20.9)
Bars	2,226,000	3,127,486	(28.8)
Weatherproof	961,000	1,325,569	(27.5)
Magnet	1,648,000	1,378,221	19.6
Rubber Covered	4,174,000	8,449,579	(26.9)
Torrance - E.M.T.	751,000	815,720	(7.9)
T.V. Mast	180,000	262,547	(31.4)
Rigid	684,000	192,318	255.7
Spiral & Aluminum	823,000	2,781,094	(70.4)
	891,000	956,849	(6.9)
	$15,806,000	$21,903,954	(27.8)

Torrance figures are presented below: (* August 1954 figures estimated)

	April-August * 1954	April-August 1953	% Increase or (Decrease)
E.M.T.	$719,151	$783,955	(8.3)
Elbows	6,257	6,757	(8.0)
Mechanical Tubing	33,835	25,048	34.8
Rigid - Elbows & Couplings	14,527	1,377	955.0
Rigid - Conduit	665,643	191,655	247.3
T.V. Mast Tubing	166,666	262,546	(36.5)
	$1,606,079	$1,271,338	26.3

The operating figures for Rome and Torrance are noted in the tabulation below:

	April-July	August Est.	April-August 1954 *	April-August 1953
Rome Plant				
Net Earnings	$232,175	$68,000	$300,175	$814,066
Less Metal Profits transferred to Reserve	-0-	-0-	-0-	65,000
Net Retained	$232,175	$68,000	$300,175	$749,066
Torrance Plant				
Net Earnings	$11,321	$10,000	$21,321	($30,086)
Reserve	-0-	-0-	-0-	-0-
Net Retained	$11,321	$10,000	$21,321	($30,086)

[fol. 5084]

ROME CABLE CORPORATION

OPERATING FIGURES (Cont'd.)

	April-July	August Est.	April-August 1954	April-August 1953
Company				
Net Earnings	$243,496	$78,000	$321,496	$783,980
Less Metal Profits transferred to Reserve	-0-	-0-	-0-	65,000
Net Retained	$243,496	$78,000	$321,496	$718,980

I point out the fact that this year our July operations included an unusual two weeks vacation.

The backlog of orders shows a marked drop from January 30th to May 31st, particularly due to "Spiral Four".:

			Value
January 30, 1954	Rome - Wire Products		$2,155,000
		Aluminum	274,000
		Spiral 4	1,269,000
			49,860
	Torrance - BMT		1,980
		Rigid	130,500
		T.V. Mast	$3,818,220
May 31, 1954	Rome - Wire Products		$2,318,000
		Aluminum	298,000
		Spiral 4	100,000
	Torrance - BMT		3,920
		Rigid	27,400
		T.V. Mast	-
			$2,747,320
August 7, 1954	Rome - Wire Products		$2,206,000
		Aluminum	394,000
			25,600
	Torrance - BMT		154,000
		Rigid	39,750
		T.V. Mast	$2,819,350

In addition to the above we have received a contract of $1,845,000 for "Spiral Four", shipments to begin April 1, 1955 and to continue through March 1956.

ORDERS AND SALES

The order picture continues to improve. Total copper contents without considering "Spiral Four" order are about 20 per cent ahead of July a year ago and brings the total for the first eight months to about 8 per cent behind the same period a year ago. It is our belief that incoming orders for the calendar year 1954 will exceed 1953.

I deplore the suffering and loss caused in New England due to the hurricane of August 31st. We are receiving rush orders for wires and cables to help restore electric services in the stricken areas. These rush orders, largely for Weatherproof, will probably result in increasing our sales in the month of September by approximately $200,000.

[fol. 5085]
ROME CABLE CORPORATION

ORDERS & SALES (Cont'd.)

Because of the two weeks vacation shut down sales hit a low point of the year in July. August level will run approximately average for the first quarter, but September should run over 20 per cent above that. The present quarter, however, as a whole will be about 7 per cent below our first quarter of this fiscal year. Excluding "Spiral Four", sales in the current quarter should about equal that of a year ago, with indications that the following quarter will exceed a year ago.

ROME PLANT OPERATIONS

Sales have been on a much reduced scale but in recent weeks are showing evidence of an improving trend which I hope will continue for the balance of our fiscal year.

PRICING SITUATION

There have been four small price changes in the badly affected building wire items. Net overall effect is an increase of 7-1/2 per cent from the low reached in June. To accomplish these there have been four separate price rises and with each rise the loss from raiding of consigned stocks is a very considerable item.

MATERIALS

With the 16 day Kennecott strike having been settled and several other companies having signed labor contracts, we expect to have sufficient supplies of copper to meet our customers' requirements. Even if the Anaconda strike continues, we should be in a comfortable position with nine active suppliers. Aluminum is in very plentiful supply and other materials are readily obtainable.

CAPITAL EXPENDITURES

The following E.R's have been approved since the last meeting of our Board:

E.R. No.	Description	Amount
1631	Purchase from Signal Corps an Air Compressor	$ 3,030.69
1632	Purchase from Signal Corps a Power Distribution System	26,969.31
1633	Purchase five room air conditioners	1,420.00
1634	Purchase 22 Friden Calculating Machines	9,518.00
1635	Purchase and install 4 Bunch Stranders with payoffs	30,000.00
1636	Purchase and install plastic cubing equipment	10,000.00
1637	Purchase and install a Robertson Lead Extruding Machine	82,500.00
1638	Purchase and install preformers	3,600.00
1639	Purchase and install dome type vulcanizer	31,500.00
1640	Purchase and install a lead stripper	15,000.00
1641	Purchase labor and materials to clear site for Bldg. No. 22, etc.	61,300.00

[fol. 5086]

ROME CABLE CORPORATION

CAPITAL EXPENDITURES (Cont'd.)

E.R. No.	Description	Amount
1642	Purchase and install a built-in Corona Level Equipment	$ 7,500.00
		$282,338.00

PAYROLL STATISTICS

Payroll statistics are given below and show the effect of reduction in hours and the end of our "Spiral Four" contract. We regret that this "Spiral Four" contract was not carried out as we had been led by the Military to believe it would be. This closing necessitated the loss of a number of valued employees.

Factory payroll statistics for Rome and Torrance are as follows:

Week Ending	No. Employees	Total Payroll	Avg. Weekly Wage	No. Salaried Employees
ROME				
9/27/53	M 989 F 88 1077	$80,150.93 5,272.13 $85,423.06	$81.04 59.91	412
2/1/54	M 961 F 71 1032	$71,992.95 3,526.01 $75,518.96	$74.91 49.66	417

TORRANCE PLANT OPERATIONS

Glenn Kogar has been at Torrance for about two months now and we are very pleased with the manner in which he is taking hold.

Torrance sales in the current quarter will set a new record and should run better than 25 per cent above the last quarter.

It would be nice to be able to report that all of our troubles are over there, but I think it best to say that excellent progress is being made. There has been very little trouble with the furnace. It now has a capacity beyond the current production rate of the tube mills. Rehabilitation and replacement of rolls on the tubing equipment were found necessary owing to a poorer program of maintenance.

[fol. 5087]

ROME CABLE CORPORATION

TORRANCE PLANT OPERATIONS (Cont'd.)

Gil Woodill has found some interesting potential prospects for industrial tubing, which if realized should very substantially improve operational results.

LABOR RELATIONS

Effective August 9th we granted a voluntary five cents hourly increase to all hourly workers and an equivalent amount to salaried workers in addition to improving hospital allowances from $9.00 to $10.00 per day. These allowances were approved by the Executive Committee at a meeting held on August 5, 1954.

We are still negotiating with I.A.M., Local #1875, representing maintenance workers, to complete a new contract. The expiration date of the old contract was August 3rd.

On August 26, 1954, the National Labor Relations Board supervised a consent election for production workers in the Rome Plant to determine recognition with I.A.M. to represent them through their Lodge #157 in Utica. The Union lost the recognition election by a vote of employees 557 "No" and 116 "Yes" (or 82.7 per cent of total vote). Only one vote was challenged and one vote voided out of a total of 701 eligible employee voters. Conditions prior to and during the election were quiet, and good relationship was maintained and is still being maintained with the employees and the labor organization.

I think the result of the voting of our employees mentioned above is a great tribute to Ross Fraser, Charlie Ellis, Gerald Commerford and our supervisory staff in the factory. It shows that they have continued to cement the pleasant relationships that have existed with our working people over the last eighteen years.

HENRY STREET CROSSING

The Henry Street raising project is proceeding rapidly and provided the weather holds out it should be completed within two weeks. This will effect the level cross-over connection between Building No. 15 (Rubber Covered) and the new Shipping and Storage Building No. 22.

The new Shipping and Storage Building No. 22 is estimated to be completed and ready for occupancy the early part of December. Bids are now being received which indicate the cost of the 90,000 sq. ft. building should not exceed $400,000, including installation of the railroad section within the building, the black top entrances and parking area for truck loading and standby, both within and outside the building.

CAPITAL EQUIPMENT PROGRAM

The capital equipment program and rearrangement of departments should proceed along the following schedule:

All purchases and delivery of new equipment by April 1, 1955.

Departmental rearrangement should be concluded by late 1955.

[fol. 5088]

ROME CABLE CORPORATION

"SPIRAL FOUR"

On August 4th we were notified by the Philadelphia Office of the Signal Corps that on our bid of $102.50 per quarter mile length we had been awarded three-quarters of the total procurement for the year April 1, 1955 to March 31, 1956, or a total of 18,000 units with a total value of $1,845,000. The opportunity to bid on this changed our plans regarding storage of equipment and delayed finalization of contract. The Signal Corps have agreed to pay us $26,000 per year for storage of equipment with charge when equipment is activated, to be on a proration of value basis. Officials of the Signal Corps will be here September 13th to review the details of the rehabilitation contract.

A ruling issued last week by the Office of Defense Mobilization presents what should be more attractive possibilities to cover strategic standby facilities such as ours. These matters will be discussed with the Signal Corps on their next visit.

RENEGOTIATION

The Renegotiation Board has asked for additional data so that final determination is in the same status as the time of my last report.

CONSULTANTS

By mutual consent our arrangement with Mr. J. C. Ward, Jr. has been discontinued. This is due entirely to the fact that Mr. Ward, now President of Vitro Corporation, is so immersed in the details of his business that he would not have the time to give to our affairs.

RESEARCH

Our Research Department is continuing to work closely with the Air Force and has recently been asked for a study of a suitable connector for a cable with Polyethylene sheath replacing Neoprene. Several orders have recently been received for a new cable, Coaxial Flame Resistant Polyethylene. With all the new materials available it is necessary that continuous study be made to keep abreast of the times.

AMERICAN SYNTHETIC RUBBER COMPANY

There have been no further developments on the American Synthetic Rubber situation, except that Essex Wire has been added to the wire mill group. We do not expect to know how successful our bid will be until early 1955.

EARNINGS AND DIVIDENDS

At our last Board meeting I presented figures covering the five years ending March 31, 1950 to and including March 31, 1954. Average per year net earnings were $1,524,000 while dividends averaged $486,000, or 31.2 per cent. While our earnings during this present quarter will touch a low point, we believe that the third and fourth quarters of our present fiscal year will show steady improvement in sales and earnings.

I recommend the continuance of our present rate of 35 cents per share on the Common Stock payable October 1, 1954 to stock of record September 17, 1954, following which the usual action should be taken on the Employee Dividend payable at the same time at the same rate per unit.

[fol. 5089]

ROME CABLE CORPORATION

ALUMINUM SITUATION

Our aluminum business has grown in importance, the year ending March 31, 1954 exceeding the prior fiscal year by approximately 30 per cent. We believe this growth will continue for some time in the future. The aluminum officials have advised Mr. Fraser at a meeting held in April that they had no present plans to go into the insulated aluminum cable business themselves and assured us that if their policy changed they would try to give us one year's notice. I have the feeling that our business with them will probably not continue indefinitely and that we should carefully study whether or not it is to our ultimate advantage to continue such an uncertain situation indefinitely. This subject is one of great importance to us and should be given our most careful consideration.

BONUS PLAN

At our last Board meeting I appointed a new Bonus Committee and anticipate we shall have a report from them at this meeting. I am confident it will be of great interest as your Committee, consisting of Messrs. Fraser, Collins, Kroeger, Jack Byett and A. D. Berning, has studied this matter not only very carefully but they have had full advantage of all the studies on this subject that have been made in our office during the past year.

LONG TERM LOAN

Our Company entered into agreements with J. P. Morgan & Co. Incorporated, The Connecticut Mutual Life Insurance Company and Massachusetts Mutual Life Insurance Company for $4,000,000 to be repaid by serial notes over a period of fifteen years. Morgan participated to the extent of $1,000,000 payable in semi-annual installments of $125,000 each commencing February 1, 1955, interest 3 per cent per annum. The insurance companies each participated in $1,500,000 to be repaid at the minimum rate of $250,000 annually on each August 1st during the period 1959 to 1968 and the balance of $500,000 maturing August 1, 1969 with interest at 3.9 per cent per annum.

After the payment of a $1,000,000 short term loan on September 15th we will have no other borrowing indebtedness.

THE FUTURE

I quote the following from a letter of August 13th signed by Mr. Fischer Black, Publisher and Editor of ELECTRICAL WORLD:

> "Practically unanimous is the agreement that the inherent growth probabilities of the industry indicate a doubling of its business by 1964 and a tripling by 1970."

Respectfully submitted,

H. T. DUNN
Chairman of the Board

[fol. 5090] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 93

9/13/54—HTD:AS

Memorandum of Conversation at My Home with Ralph Davies, R. Murray Willard ("Jess"), J. H. Dyett and Myself.

I asked Ralph if he felt that our company was giving full cooperation and he said "so far as I know. I should say that the cooperation between the two companies were perfectly satisfactory with, of course, the little usual troubles on each side." I asked him if they had any plans or were contemplating making a study of doing their own insulating. He said he had not heard a word on this subject, he did not think it was being investigated in any way and he assured me that if it did become of interest he would estimate that from the time he told me that they were giving it consideration that it would probably take them six months to make a thorough study and one year to get their equipment into operation. He promised me that he would notify me the moment they started to investigate equipment. He quite appreciated that we were entitled to all the time that they could give us if they reached a determination to go ahead with their own insulating.

He then spoke of the Southern Electric Company as the bad boy that was causing quite a little trouble. He had heard rumors that one or more of the principals in the company wanted to sell. He did not believe that they were operating at a profit at the present time. He thought they had continuous trouble on their rolling mill and so far as he knew they had not solved this trouble yet. He seemed to agree with me that Al Tessmann was a good man. He asked what I thought of the other principal and I replied that I did not feel that I knew him well enough to say much about him. I, therefore, did not express any opinion. However, I think he was able to get the impression which I feel is mutual that he would not make a desirable man to tie up to. He felt that the Southern business had been built up from the start by price cutting and he believed under the present

management it would probably continue along that line. Ralph said he hoped that if they sold that that would sell out and fall into strong hands who would cooperate. I rather thought that this might be some little indication that his *could* would not be adverse to our stepping into the picture there.

Ralph asked how the Properzi equipment was operating. I expressed my own individual opinion that we had made quite a little progress in the last few months but I thought it would continue to be little changes here and there that would eventually produce high quality at a reasonable cost. I made the remark that if the Properzi turned out to be very satisfactory and if Alcoa continued their present policy of selling aluminum at a delivered price all over the country that there might come a time when, if our relationship with their company continued, we might discuss with them the desirability of a small Properzi wire drawing and insulating plant somewhere in the south or the west. I asked him if he had ever given this any thought and if so I would be interested in his thinking regarding a location that might be of interest. He mentioned their new Texas aluminum plant was opening this summer and thought that that would be a very desirable location.

Ralph asked me what I thought about the price of copper. I told him Jack knew a good deal more about the copper situation than I did but between Jack and myself we gave him the understanding that we expected a price drop in copper in a year or two. We did not believe from what we had heard it was liable to have a serious effect on the price advantage now enjoyed by Aluminum Company.

[fol. 5091] Jack asked him what effect they expected at Massena due to the proposed state development of power. Ralph stated that as the work progressed that they would lose their cheapest power development on the St. Lawrence and that it would be a very harmful thing to the Aluminum Company. After talking it over I made the remark that it seemed that the only fair thing to do was to attempt to assure Aluminum Company that they would be given at least the opportunity to contract for the same amount of power they were not using at the present cost price that they now enjoyed. Ralph made the significant remark that the build-

ing industry was now accounting for about 18 per cent of all the aluminum sales.

Ralph could not have been friendlier and before he left he urged me to come down to Pittsburgh with you some time and see the transformation that has taken place in that city.

[fol. 5092] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 95

To: R. A. Gray
From: E. Mark Wolf
Date: March 17, 1955
Subject: R. E. Uptegraph Mfg. Co.

CC: R. A. Schatzel, F. S. Marks, G. E. Rolston, J. R. Woods

Dear Dick:

The question of aluminum vs. copper for electrical conductors is doubtless going to spread to other fields as the spread in price between the two metals increases. Fortunately, in the case of transformers, we have a pretty good background to work from because of previous work with Westinghouse and Moloney.

The magnet wire coverings which we supply and the equipment which we use are not sensitive to the type of conductor involved. All of these coverings can be applied equally well to copper and aluminum, and the quality of the coverings will be about equal in either case. We have noted no significant difference in bonding of glass coverings between the two metals.

Because of design considerations involving size and weight, the economics of the situation up to the present time have not justified the use of aluminum conductors in liquid cooled transformers. In the case of air cooled transformers, however, the economics apparently looked interesting when copper was 30¢.

In actual production trials certain unforeseen increases in time and labor largely nullified any apparent advantage with aluminum. The people I have talked with generally have felt these problems could be solved with experience.

Aluminum magnet wire apparently winds more easily

than copper. However, because of its lower mechanical strength it is desirable to depart from dead soft wire and increase hardness to the point where windability is affected. This point is reached at about 17,000-21,000 lbs./sq. in., which is only about ½ the tensile strength of soft copper. More blocking and supporting of the coils is necessary with aluminum because of its lower strength, but this problem is readily solved.

The major item which involves increased cost is joints. In the past aluminum to aluminum joints have been made by inert-arc welding, which is a more expensive operation than the usual carbon block brazing employed with copper. Aluminum to copper joints have required silver plating of the copper. We think other methods of joining may be developed to solve this problem.

While delivery problems are not in my department, I have talked with F. S. Marks, who advised that promises may run 1 to 2 weeks longer than copper magnet wire.

E. Mark Wolf

EMW/jbb

[fol. 5093] In United States District Court

Plaintiff's Exhibit 96

Meeting Held May 3, 1955—Subject: Aluminum

Present: Messrs. A. D. R. Fraser, C. H. Ellis, G. E. Rolston, R. A. Schatzel and J. H. Dyett.

C.H.E. advised that we could have a 600,000 lb. monthly capacity on a two-shift basis. He has received recently encouraging reports both technically and manufacturing-wise. An additional furnace would be required but this should improve costs and give us insurance against shut downs.

R.A.S. pointed out that in order to arrive at one-half million pounds minimum monthly we would have to make certain assumptions that we would have the following product list:

1. 3/8 and 7/16 rods in coils (or reels).
2. H.D. wire H19 sizes .061 through 2.
3. Solid or Stranded H26 size 14 through 500 M Stranded.
4. Triplex and line wire.
5. Insulated building wire and RR to 500 M.

In his opinion we can continue to use an electric induction furnace if we can be sure of getting the same purity aluminum. We have had no trouble since the metal has been cleaned up. Spout trouble has ceased. Mr. di Lustro of Anaconda stated that if they were independent and could get Alcoa metal he would recommend putting in a 30,000 lb. reverbatory furnace. Holding the metal would be necessary. Revere is planning on going to a 30,000,000 lb. capacity monthly. Reverbatory furnace is cheaper but we should have 2,000,000 lbs. a month. Consequently, Mr. Glesmann has recommended that an electric furnace would be better for us. Nichols is using two Ajax furnaces and two 5,000 lb. swindle ladles. He expects to have one hour's holding time for 2500 lbs. an hour.

We must get assurance of Alcoa first that they can continue to supply the pure metal which comes in as EC 99.55 but actually is considerably purer. We set the specification on what we are receiving but Alcoa says that if we actually specify 99.70 we would be charged one cent additional and two cents additional for 99.8. It was pointed out that we should prepare for 1,000,000 lbs. a month. A.D.R.F. said that he would present the problem to Messrs. Davies and McGee, telling them that they have developed a metal which is good for the Properzi and wondering if we can get more. A.D.R.F. wondered if we could offer to pay a premium. According to R.A.S. he did not know whether or not we could use other materials with the swindle ladles.

C.H.E. pointed out that the Properzi cost was 6.22 per pound in March as compared with 6½ cents cost of rod from Alcoa. That 6.22 cost is with no piece work. In producing 12,800 lbs. in eight hours the cost should be reduced to 5½ cents, while on a two-shift basis it would go to 4.7 cents per pound. Overhead is 7 to 1 on 6.22 cents, 6½

to 1 on 5½ cents and 5¼ to 1 on 4.7 cents. A.D.R.F. pointed out that this was still high. C.H.E. agreed on this but pointed out the power load. With a large 5,000 lb. package only 30 per cent man load on the Elevator Supply. We can get 2,000 lbs. of aluminum an hour on size 8 with this man load. We could use one or two more machines. C.H.E. stated that we could take one of our old heavy intermediates, which however is hard to pry loose, and a light intermediate which we have already set aside. He feels we are inadequate in drawing at the present time.

[fol. 5094] R.A.S. thought that we should stop producing building wire at size 6. According to C.H.E. we should give the Sales Department a chance to sell at the rate of 2,000 lbs. an hour before we spend any money on new machines. G.E.R. said that .077 for #4 strand is the biggest size required. C.H.E. thought we could be competitive with a small capital expenditure.

It was R.A.s' opinion that we should have two furnaces in any event. Mr. Glesmann knows of three on the west coast ready to be uncrated at about $19,000 each. To this would be added the installation cost and the labor. Our present furnace cost us about $70,000. Mr. King at Vancouver favors the reverbatory furnace.

The question of selling rods is a new problem to G.E.R. Fabricators cannot afford to pay 28 cents for rods and compete on ACSR (there are only 16,000,000 lbs. a month of this sold in the country, and only 2,200,000 lbs. a month in covered aluminum wire). Simplex can't buy aluminum and supply Triplex and break even. At the present time we are accounting for about 10 per cent of the covered aluminum wire in the country. We might possibly get some rods from Okonite. G.E.R. pointed out that we would only get 40 per cent as much on the covering of aluminum building wire as do for copper owing to a bad pricing situation.

In view of the sales picture C.H.E. thought we should emphasize lower costs with minimum expenditures for the next three months. A maximum of $15,000 should be spent for drawing, in his opinion. A.D.R.F. will plan to see Ralph Davies on May 9th. G.E.R.'s best guess would be about 50,000 lbs. a month use at Okonite and Hazard.

(Other subjects.)

On reverse lay R.A.S. stated that we would have to sign a license for $5,000 before we could get into the Okonite plant to see the operation.

C.H.E. recommended that we go from 70 to 95 units of Spiral Four a day and run out the contract two months early. This should provide lower costs. According to A.D.R.F. this sounded satisfactory but J.T.S. should be consulted.

JHD:AS

[fol. 5095] In United States District Court

Plaintiff's Exhibit 97

A. D. R. Fraser
R. A. Schatzel
May 3, 1955
1954

Activity in the field of Research, Development, and Engineering affects most products and processes, as well as the evaluation (testing) and application of our products for useful purposes.

In expectation of the transfer of rubber plants from Government to private operation, many companies accelerated their research in high Polymers. With the actual transfer having been accomplished, Research activity under private operation has been greatly increased. Many new and improved types of rubber and plastics, as well as compounding agent for modifying the properties of these materials are being turned out at an ever-increasing rate. These are bound to have a great impact on our processes and products. We have a vantage point of contact by our association with American Synthetic Rubber Company.

With the gyrations of the copper market and the relative stability of the aluminum market, as well as its increased supply, a greater interest in aluminum has been engendered. Our development of aluminum from ingot to insulated conductor has progressed well. The problems of quality have been overcome and the problem of cost reduction is now one of volume. Industry studies of safe

operating practices of aluminum conductors are well on the way to completion. Aluminum is now ready to take its place as an accepted conductor for electrical distribution.

During the year we completed another phase of our survey of Airport Lighting Cables for the U.S. Government. The recommendations for an insulated conductor were accepted and we are now completing the final phase, the development of proper means of connection which constitutes a complete system of Airport Lighting Cable and installation means.

The growth in the use of Butyl rubber insulation has increased, as has also the growth in use and supply of Polyethylene; our Laboratory has developed a new plastic sheath—RoSeal—which combines improved mechanical and electrical protection to cables at a reduced cost.

While the Mining industry has been at low ebb, the interest in better cable has been greatly accelerated. This is often true as an industry slows down. As a result of our industry cooperation with the Mining industry, in which we had an important part, new designs of Mining cable were developed, and improved methods of evaluation which will result in greater safety, as well as a more reliable service in this industry.

The developments at Torrance have been largely those of cost reduction. However, several mechanical improvements were completed in the making of Rigid Conduit [fol. 5096] which have resulted in the filing of two patents. We feel confident other patents will result from developments now well under way.

R. A. Schatzel.

RAS P

[fol. 5097] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 98

To: C. H. Ellis
From: R. M. Fraser
Date: August 16, 1955
Subject: Aluminum

Cc: R. A. Schatzel, F. P. Baumler, G. L. McCutchan, G. Pirk, W. Schneible, C. Baker, R. Schiller, Dr. Fuller, L. Fitler, G. Commerford

Yesterday afternoon Messrs. Schatzel, Baumler, McCutchan, Pirk, Schneible, Baker, Schiller, and Dr. Fuller met with you and the writer to discuss the production of aluminum rod and wire.

Charlie Baker reported that present average daily production in a 9 hour day is 15,000 pounds, and at this rate it was estimated that we could produce on a 2 shift basis 600,000 pounds per month.

You stated that we should aim at a production of 1,000,000 pounds per month.

There was considerable discussion regarding the best type of melting and holding furnaces and other details of production. The objection to gas fired reverberatory type of melting furnace is the necessity of purging the melt of hydrogen, which process produces chlorine gas which would be very objectionable—especially at this location, and the neutralization of which would be costly and present many other problems.

Rudy Schatzel reported that he had several discussions regarding this matter with members of other organizations, and in particular reported a conversation with Louis Glesmann of Revere in which Mr. Glesmann recommended for production ranging between 500,000 and 1,000,000 pounds per month the use of electric induction melting furnace with Swindell ladles or holding furnaces. He would recommend the reverberatory type furnace only if production requirements exceed 2,000,000 pounds per month.

I was instructed to obtain quotations on an induction melting furnace having a capacity of 2,500 pounds per hour and 2 holding pots.

We will also investigate other types of electrically heated furnaces.

It was also decided that I should further investigate the Waterbury-Farrel continuous rolling machine.

It was reported that Nichols Wire & Aluminum Company of Davenport, Iowa, have a new Ajax melting furnace with Swindell ladles in operation, and I am to make arrangements for a group to visit that plant in the near future to observe operations.

Assurances were given that the roof of the reconditioned Building No. 1, in which the aluminum operation will be located, would be of suitable height to provide proper ventilation and improved working conditions.

[fol. 5098] Frank Baumler brought up the matter of drawing the additional production of aluminum rods, and he was advised that our budget contained an item of $46,000.00 for a new drawing machine.

R. M. Fraser.

[fol. 5099] In United States District Court

Plaintiff's Exhibit 99

Minutes of the Executive Committee of Rome Cable Corporation August 17, 1955

A meeting of the Executive Committee of Rome. Cable Corporation was held on August 17, 1955 at 10:00 A.M.

There were present: Messrs. Bernard, Collins, H. T. Dyett, J. H. Dyett, Ellis, Fraser, Rolston and Schatzel. Mr. J. H. Dyett acted as Secretary of the meeting and read the minutes of the Executive Committee meeting of August 15, 1955 which were unanimously approved.

The following E.R.'s were unanimously approved:

C-249, C-250.

Mr. Ellis explained the savings in this fiscal year's E.R.'s over the estimates and discussed the additional aluminum equipment which would be required to give 1,000,000 pounds a month. He emphasized the insurance factor of another

furnace for production of 500,000 pounds a month. After discussion, upon motion duly made, seconded and unanimously carried, it was

Resolved, that the sum of $165,000 be and hereby is appropriated for the full reconstruction of Building No. 1 as proposed by Mr. Ellis on August 15, 1955.

Mr. Fraser presented a Pension Plan outline to all Executive Committee members with the request for suggestions. There followed a discussion of participation in the Executive Bonus.

Mr. J. H. Dyett presented a proposed salary change schedule and merit increases which would bring total general and merit salary increases to approximately $8,000 a month. After discussion, upon motion duly made, seconded and unanimously carried, it was

Resolved, that the general rate schedule as presented by Mr. Dyett be and hereby is approved, and it was further

Resolved, that the merit salary change as listed below be put into effect on the dates given, for the balance of the fiscal year.

ROME CABLE
CORPORATION

ROME, N.Y.

REPORT SUBMITTED TO THE BOARD OF DIRECTORS OF ROME CABLE CORPORATION AT THEIR MEETING SEPTEMBER 7, 1955

I present herewith net sales and earnings by fiscal years up to March 31, 1955, the April - June quarter and by months to date:

Fiscal Year Ended	Net Sales		Earnings
March 31, 1937	$ 1,798,092		$ 1,636
March 31, 1938	4,957,103		71,027
March 31, 1939	5,370,665		245,036
March 31, 1940	6,080,902		297,736
March 31, 1941	9,465,651		431,501
March 31, 1942	11,631,785		592,135
March 31, 1943	12,712,333		367,654
March 31, 1944	16,909,735		466,709
March 31, 1945	22,798,218		486,653
March 31, 1946	16,975,009		398,973
March 31, 1947	18,436,305		1,359,593
March 31, 1948	25,202,853		1,152,579
March 31, 1949	26,088,523		1,115,960
March 31, 1950	19,602,984		302,209
		Plus: Transfer from contingency reserve	150,000
			452,209
March 31, 1951	35,142,901	Net $1,922,136	
		Minus: Transfer to copper reserve 150,000	1,772,136
March 31, 1952	42,657,848		1,753,651
March 31, 1953	54,632,976		2,008,321
March 31, 1954	44,114,825		1,637,787
March 31, 1955	39,186,095		930,879
April-June Quarter	11,687,152		379,847
July	3,838,914		161,738
July-Sept. Quar. (Est.)	13,733,000		450,000
		First Six Months Est.	$ 830,000

[fol. 5103]

ROME CABLE CORPORATION

Breakdown of sales before deduction for discount and freight for April to August 31, 1955, with August figures estimated *, are as follows:

	April-August * 1955	April-August 1954	% Increase or (Decrease)
Rods	$ 2,161,000	$ 2,065,046	4.7
Bare	3,498,000	2,237,319	56.4
Weatherproof	1,299,000	957,224	35.7
Magnet	1,449,000	1,049,407	38.1
Rubber Covered	8,547,000	6,122,922	39.6
Torrance - E.M.T.	1,146,000	764,331	50.0
T.V. Mast	125,000	178,314	(29.8)
Rigid	1,180,000	705,445	67.4
Spiral 4	768,000	822,545	(6.6)
Aluminum	1,416,000	962,131	47.1
	$21,589,000	$15,864,683	36.1

Rome has operated since my June report to the limit possible with available copper. I believe we have been as amply provided for as possible under present circumstances. We hope copper will begin to flow more freely within the next quarter. You will recall that in my June 15th report I stated our budget for the current fiscal year indicated an anticipated 15 per cent increase in the physical volume of sales. In the last five months this figure was 22 per cent compared to an increase of 36 per cent in dollar sales.

Torrance figures are presented below:

	April-August * 1955	April-August 1954	% Increase or (Decrease)
E.M.T.	$ 1,016,000	$ 738,719	37.5
Elbows	10,000	6,399	56.2
Mechanical Tubing	120,000	19,213	524.6
Rigid - Elbows & Couplings	45,000	16,562	171.7
Rigid - Conduit	1,135,000	688,883	64.7
T.V. Mast Tubing	125,000	178,314	(29.8)
	$ 2,451,000	$ 1,648,090	48.7

The profit in July at Torrance was abnormally high because our sales jumped to $814,000, which was double the average monthly shipments. On sales of $400,000 our profit would be about $24,000 per month. However, we expect later this month to make a contract with the Pittsburgh Steel Conduit Company under which they would take their west coast requirements from us, amounting to $600,000 to $1,000,000 per annum. This should have a beneficial effect on our future earnings. While this arrangement will help us at our Torrance Plant it still leaves our company without the ability to sell conduit at a profit in the eastern market. This is something that we shall continue to study and hope for a solution later.

[fol. 5104]

ROME CABLE CORPORATION

BACKLOG OF ORDERS		Value
January 30, 1955	Rome - Wire Products	$2,327,000
	Aluminum	527,000

		$4,753,000
May 31, 1955	Rome - Wire Products	3,921,000
	Aluminum	623,000
	Spiral 4	1,640,000
	Torrance - E.H.T.	44,000
	Rigid	75,000
	T.V. Mast	-
		$6,303,000
August 20, 1955	Rome - Wire Products	3,438,000
	Aluminum	932,000
	Spiral 4	1,077,000
	Torrance - E.H.T.	365,000
	Rigid	427,000
	T.V. Mast	33,000
		$6,272,000

Incoming orders for the first eight months this year show a 46 per cent dollar gain over a year ago.

COPPER

On August 17th Anaconda Copper Company changed their copper price from 36 cents to 40 cents per pound, and on August 25th they raised their price from 40 cents to 43 cents per pound, shortly followed by similar action on the part of Phelps-Dodge. Kennecott increased its price to the 43 cent figure, effective September 1st. We are not unconscious of the fact that the price of copper is the highest it has been during my lifetime, and we shall carefully bear this high price in mind and try to protect ourselves as thoroughly as possible, so that we do not get badly caught some time in the future. Consumers are paying over 50 cents per pound for nearby copper, but we are staying clear of this premium copper except where our customers request it. Steel and aluminum are both in short supply, and we are having difficulty to protect ourselves fully for anticipated enlarged requirements. I believe, however, we are doing all possible to guard against metal shortages.

ALUMINUM

It is evident that with copper at or near its present price the use of aluminum is going to grow very rapidly. We have done considerable business with Alcoa on a toll basis and while we have no assurance of long continuance of this business, we are hopeful that we may be able to retain at least a very large portion of it. I believe with conditions as outlined that we will

[fol. 5105]

ROME CABLE CORPORATION

ALBRIGHT (Cont'd.)

shortly have a meeting with Ralph Davies, Vice President in Charge of Sales, and his sales manager of wire and cable products, here in Rome - I hope by the end of this month. Our Rome Plant does little or nothing in the manufacture and sale of ACSR transmission cable. This might be a large item if we were located in a portion of the country where large buying of this type takes place and our costs permitted us to compete at a profit. This is a subject of great importance to us for the future. I have thought for at least five years that we were handicapped by having only one wire and cable plant. Present freight rates handicap us in meeting competition in many territories. I believe this is a subject for very serious consideration in the coming twelve months. I think we will gather some very interesting information from Mr. Davies when he is here and that certain information which our Mr. Ellis has secured this past week should be thoroughly discussed at this meeting.

I will ask him, after our formal portion of this meeting is over, to bring up the possibility of acquiring two Properzi units and furnaces at a price of approximately $150,000, which represents approximately 60 per cent of what new equipment would cost. I understand that the above equipment under discussion is the property of Anaconda Wire and Cable Company which has been in service a comparatively short time and is in good condition, and which at present is surplus equipment to them on account of a new very large aluminum rolling mill installed by the Anaconda Copper Company out in Montana. I feel that after you have listened to Mr. Ellis' story that we will be warranted in giving him power to enter into the proposed purchase. Mr. Ellis expects to be able to get the final story on this proposition tomorrow. Therefore, we must consider this matter seriously today.

LABOR SITUATION

The Executive Committee approved an increase in labor rates of six cents per hour to all hourly workers affective August 29, 1955. We also approved certain upward revisions in specified job classifications. Increases to salaried workers to meet these new conditions were made effective September 1, 1955.

The Executive Committee approved a modification of the Employee Dividend-Sharing Plan to include a new Profit Sharing Trust arrangement. They also approved a Pension Plan. In addition improvements were made in the hospital, surgical, medical and accident health programs. The total improvement will amount to approximately a cost of 15 cents per hour. The above improvements were offered to maintenance workers represented by International Association of Machinists, A. F. of L, and accepted by them as containing the improvements in the new contract which will be negotiated prior to October 7th.

All of the above changes approved by the Executive Committee had been thoroughly discussed with our directors at their last meeting and approved in substance. I believe that our present agreement with our workers puts us well in line with other local plants and with our industry in general.

[fol. 5106]

ROME CABLE CORPORATION

Our Company factory payroll figures covering number of employees, total weekly payroll, average weekly wage, as well as number of monthly salaried employees at both Rome and Torrance are shown below:

Week Ending	No. Employees	Total Payroll	Avg. Weekly Wage	No. Salaried Employees
ROME				
9/26/54	M 862 F 22 884	$79,904.19	$90.39	413
2/6/55	M 840 F 22 862	71,500.32	82.95	414
8/14/55	M 854 F 37 891	73,440.79	82.42	419
TORRANCE				
9/25/54	139	14,146.53	101.77	31
2/5/55	136	12,109.35	89.04	33
8/7/55	125	11,641.38	93.13	38

CAPITAL EXPENDITURES

Major equipment already ordered but not received is as follows:

a) One heavy Lamuth strander to improve our production volume - necessitated by higher aluminum cable production.

b) One large lead extruder and dome vulcanizer for same - to expand our product line.

c) One large cabler to expand product line and manufacture cables up to 61 wires. This will be particularly suitable for control cables and will permit us in one operation to put on layers of 6, 12 and 18 wires. This, with the center wire, would give us a complete one-operation cabling of 37 wires.

d) One special reverse lay cabler for aerial cable.

e) One large tripling machine to increase output of Triplex cable.

The above equipment is scheduled for delivery between September 1955 and April 1956.

The Executive Committee at a meeting held August 17th approved the expenditure of $165,000 for the rehabilitation of approximately 34,000 sq. ft. of Building No. 1. This important improvement should be completed within the calendar year 1955. It would transform a very old building to a much better building with higher head room and with an inside railroad track. The new

[fol. 5107]

ROME CABLE CORPORATION

CAPITAL EXPENDITURES (Cont'd.)

building with added height will permit better and safer operation of our Properzi aluminum equipment including electric furnaces. The estimated cost of this building will approximate $5.00 per square foot.

We are presently endeavoring to get accurate estimates for all costs in connection with increasing our equipment for aluminum rod and drawing capacity to a safe million pounds production per month figure. We are now procuring costs for an additional electric furnace and holding ladles and a heavier rolling mill. These additions would give us the possibility of turning out about one million pounds of aluminum per month at lower costs than at present. At present volume we are producing aluminum rod at 2.1 cents per pound under the present purchase price for aluminum rods. We believe that this new equipment will permit us to expand our business and secure competitive costs.

I am attaching to this report a list of the E.R's approved since the June 15th meeting of our Board.

SPIRAL FOUR

Our production on Spiral Four is at the rate of approximately $150,000 per month.

MARKET SITUATION

We expect the heavy demand for wires and cables will continue throughout the current fiscal year. Owing to the very high price of copper we expect a greater and greater interest will develop in the use of aluminum wires and cables.

REARRANGEMENT OF PLANT

The plant rearranging program is proceeding as scheduled.

a) The complete synthetic extrusion department has been removed from Bldg. No. 15 to Bldg. No. 20, including five present machines and an additional new high economy extruder for competitive plastic wires.

b) The complete Reflex department has been removed from Bldg. No. 15 to Bldg. No. 20.

c) Three-quarters of the Magnet Wire Dept. has been removed from Bldg. No. 4 to an improved section of Bldg. No. 1. The Magnet glass wire machines will complete this department move to Bldg. No. 1 by September 15th.

d) Partial movement of the Receiving Dept. from Bldg. No. 7 to Bldg. No. 1 has been accomplished. No further movement in this change will take place until the rehabilitation of Bldg. No. 1.

e) Spiral Four has been removed from the main floor of Bldg. No. 20 to the basement of Bldg. No. 20 for both production and storage.

Of course, all of the above changes were preceded by the erection of the new Bldg. No. 22 for Shipping and the removal of that department from Bldg. No. 1 to Bldg. No. 22.

[fol. 5108]

ROME CABLE CORPORATION

PRODUCTS

At my request Mr. Holston on August 26th presented me with a very thoughtful report listing each major product class and the products under such class which we now produce; also a suggestion of those items which he would consider as suitable for our consideration as additions to our line at some time. I will quote from his report on Magnet wire:

"I believe that the time is rapidly approaching when we will have to give serious consideration to the question of enameling wire, both synthetic and regular type. There are definite indications that enameled types of covering are now gaining favor for transformer work which represents a large portion of our business."

Under telephone wires and cables he states:-

"We have already produced the plastic telephone cable in small quantities and have authorized the purchase of new cabling equipment."

I think we all realize this represents an opportunity with the cabling equipment now on order.

Under aluminum wire he states:-

"Due to the high copper prices now prevailing, very serious study should be given to the use of aluminum in many of the copper products we now manufacture with copper."

POSSIBLE CHANGES

We had a little discussion with the officials of a prominent wire company on the subject of a possible merger, the discussions being confidential and purely exploratory. Since that meeting we have had no definite sign that the party with whom we talked has any great amount of interest in this subject. I personally feel it is exceeding doubtful if anything comes of it.

PENSION AND BONUS PLANS

You are all familiar with the adoption of our Pension Plan which with our Bonus Plan will be subject to full review at this Board meeting.

DIVIDEND ACTION

I recommend payment of our 66th dividend at the regular rate of 35 cents payable on October 3, 1955 to share owners of record of September 19, 1955.

[fol. 5109]

ROME CABLE CORPORATION

LISTING ON NEW YORK STOCK EXCHANGE

I give below the earnings for the first quarter of the present fiscal year and the figures for 1954:

	1955	1954
1st Quarter (April-June)	$ 379,847	$ 235,000

Our estimate for the second quarter 1955 is $450,000 as compared to $177,000 last year. This gives us a total for the six months of $830,000 compared to $412,000 in 1954. The six months earnings this year are at the rate of $1.63 per share of Common Stock.

Our price structure looks more favorable than last year at this time, and the present indications are that for months to come we can run our plant as full as materials will permit.

I have discussed this matter with our Finance Committee and we are unanimously in favor of making our application for listing. If our Board approves this suggestion, we should authorize our officers to take suitable action.

PRICES AND FUTURE PROSPECTS

Prices on certain products have recently been improved, and I believe that under present conditions we may anticipate a slight improvement in our profit margins, at least for the next few months.

GENERAL

At this meeting it is customary to designate the members of the Executive Bonus Group for the current fiscal year.

This year fourteen students have been granted Herbert Thomas Dyett scholarships, bringing the total number receiving aid in the current fiscal year to 38 young people.

I would like to have Mr. Schutzel, either before or after luncheon, bring us up to date on any new development projects that we will be able to offer after our insulating department is completed late this calendar year, and also to advise of the very important work he has been doing on standardization.

Respectfully submitted,

H. T. Dyett
Chairman of the Board

HTD:AB

[fol. 5110]

E. R's approved since the last meeting of the Board, June 15, 1955:

	E.R. No.	Description	Amount
ROME	1714	Design, construct and install a reverse lay cabling machine	$ 15,000
	1725	Materials and labor to construct a pit furnace with stack connected to boiler house breeching and a steel supported roof over the rubbish collecting dock	7,800
	1726	Purchase and install a band saw in the Reel Repair Shop	1,400
	1727	Purchase one portable electric welding unit	600
	1728	Purchase and install two 50 VS Reliance control units for supplying D.C. Current on Vaughn C.I. machines	9,000
	1729	Construct a new superstructure over portion of Bldg. No. 1	165,000
	1732	Purchase and install suction fan and ducts on roof of Bldg. #11	1,100
	1733	Purchase and install two suction blowers to improve ventilation of basement in Bldg. #20	4,200
	1734	Purchase and install one 100 K.V.A. Lighting Transformer	1,000
			$ 205,100
TORRANCE	C-248	Construct dumping base for special containers to be fitted to Ford Truck, and purchase 10 special containers	$ 732
	C-249	Purchase Westinghouse Air Conditioner	250
	C-250	Purchase and install Par-Air Package Coolers	3,819
			$ 4,801

Additional E.R's approved:

ROME	1688-A	Over-expenditure on 4½" plastic covering unit	$ 785
	1688-A	Over-expenditure on purchase and installation of bins, shelving, etc. for relocated Receiving Dept.	573
	1698-B	Over-expenditure on 4 Roflex paper wrapping machines	575
			$ 1,933

[fol. 5111]. 9/8/55 - H.T.H.:ss

I read the attached statement to the Board and it seemed to be unanimously approved with the exception of Mr. Krueger, who suggested he thought it possible to make a deal with Oronite. I told him this was contrary to what Al Metz had told me in my office and that I personally thought that it was very questionable if he would change his mind in this respect.

I again stated I felt that our organization would be happier running its own affairs and that we could pick up possibly one or two small companies in special lines and add to our own facilities in a new location, so that I felt our organization might not only be happier but our stockholders fully as well off as if we tried to merge with any company.

[fol. 5112]

INFORMAL REMARKS FOR THE BOARD MEETING 9/1/55 - H.T.B.:ss

I have given a great deal of thought to the present merger situation and have attempted to analyse the conditions I foresee if anything comes of the discussion started with one or two other companies. My feeling is that if a merger of three companies of somewhat similar size comes about there are many headaches and perhaps a bit of unhappiness and a political situation started that might be exceeding unpleasant.

I have personally come to favor a very careful survey of what our own Company could do by expansion, possibly picking up one or two small companies who would add to the breadth of our line and would give us another location where we might do a certain amount of insulating at some later time. I believe at the present time we are too concentrated into one location. Freight has become a more and more important factor. I have believed for the last five years that we should have another plant, the location midwest, far west or southwest, to be carefully analyzed by our Sales and Manufacturing Departments before we attempt to reach any conclusions.

I would very much like to have a full and informal discussion on this subject as to whether or no we should keep our own strong, happy organization in control but attempt to broaden our line and to open at least one more factory in some other location.. It is my present thought that such a course holds better and happier promise for our executives and a continuance of our progress for our stockholders. If I find you are in agreement with me it will entail much careful study and analysis before we could begin to arrive at any firm conclusions.

[fol. 5113] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 103

1955 Sales

E. Mark Wolf

Thank you Rudy. Well I'd like just to quite briefly go over some of the things that have happened this last year in the field of our industrial accounts, and in getting into that subject, I want to say what I have thought for a long time, that we've got more to offer potentially in that field than we're finding a place for. I think we've got quite a little to offer to these industrial accounts and electrical manufacturers—quite an impressive list of people that we've worked with, other than Magnet wire users—and in each of these cases we've been able to learn their problems and their processes and work with them—develop special little gimmicks in manufacture that give them what they need and each time we go into a new spot we carry some of that experience with us. I really think we've got a lot to offer to this class of people and it's business that I think all of you would like to work with, once you crack one of these accounts. You end up earning the everlasting gratitude of the people you work with because you've solved their problems; in many cases you're not in a highly competitive field because you're making something specially suited to their needs. That's the way we work with people like IBM, Westinghouse, Singer, General Railway Signal, Louis-Allis—there's quite a long list of them.

Let's talk just for a minute about Magnet wire and some of the things that have been going on—it's a subject I always like to talk about because I think we really have something to be proud of and I say this from my experience in getting around in the plants where our Magnet wire is used and seeing the product that our competitors are furnishing, and I still can say, as I've told you before, that there ain't nobody that makes the Magnet wire as good as Rome Cable does. I wouldn't say that if I didn't mean it. I give you one example of how that thing works out. I went with Jack Woods to an account down near Pittsburgh

a few months ago, where we were not selling Magnet wire, but he knew that they used it and we were interested in seeing what could be done. They were having a great deal of trouble with Silicone glass which is true with many manufacturers of rotating equipment and stationary equipment, and when we got down in the plant it was rather easy to see that the product they were using was in no way comparable to ours. Four different manufacturers were supplying their Silicone glass and, (I'm not exaggerating), I don't think there was a reel in that plant that would ever get out of our Inspection Department; so we started talking with these gentlemen about our Glass Magnet Wire, and when we got through he said, "Well, if your wire is half as good as you say it is, you've got yourself a new customer. Send me a sample." So I came back and had Dave Wright cut about a 15-pound sample off of one of our regular runs and sent it down to him, and it was just about two weeks ago that Jack got his first order from this customer. All he had to do was try our wire and he found . . . . RAG—I believe Mark that company just moved into the Pittsburgh area. EMW—That's right, it's a new development down there, a transfer of an operation into that area. But that sort of thing in one way or another has happened many times.

As you know, all those of you that have Magnet wire accounts, we've introduced this green tracer on our Magnet Silicone Glass Magnet Wire in the last year as a means to help these people identify Silicone glass from the regular glass in their plant. That move got many of our competitors a little sore at us and made all our customers love us, and I think that's the way it ought to be.

[fol. 5114] Glass Dacron is a new product that we've introduced this last year, and as most of you know, the first product of that kind was introduced by Phelps Dodge along about December or January. It's very much like regular Glass Magnet wire, except that instead of putting a 100% fiberglas covering on it, the covering is plied; it's made up of about half fibers of Dacron and the other half fiberglas, and the heat of the baking ovens fuses the Dacron and produces a tighter bond to the copper, a harder, tougher exterior surface—the magnet wire that seems to stand the abuse that is necessary in winding coils for rotating equip-

ment. We're making it, and I think in every way the product we're making is comparable to or better than what's being offered by others. The bulletin that you received from us sometime ago, I think, stated the case fairly well, and everything in that bulletin is still true. We're finding in general, transformer people are not too much interested in it because they're perfectly satisfied with what they've got, and find that people making rotating equipment are interested in it because it solves some of these tough winding problems.

¾ lap paper is another Magnet wire we're very proud of here. As some of you know, the development of the ¾ lap paper Magnet Wire, as we see it today, and as a product that's not too high priced—that development largely took place here. I think we originated the use of the type equipment that all manufacturers are now using for this wire, and just to show you the kind of talent we're able to bring to bear on that, I wanted to tell you one thing that's happened internally here. One of the problems in making this wire is to get this paper on without wrinkles. Wrinkles affect dimensions, and they make the wire more susceptible to damage during winding, and one of the things that is needed in putting this paper on is a proper nosepiece and polishing head on the machine. I don't know how many different types of nosepieces we developed here in an effort to solve the problem. They all improved it a little bit, but none of them completely cracked it. We still were head and shoulders above our competition, but none of us were doing the job that needed to be done. Then one of the operators of our paper machines got interested in the problem; it happened that he and his father had a small machine shop at home, and one morning he came in and handed Dave a nosepiece that he built at home in his spare time and wanted to know whether we could try it. So it was put on the machine experimentally, and while there were some faults in it, it was the first real step that we'd been able to make—it looked like a positive improvement. The thing went through several revisions—all at home in this fellow's shop, and the result was that this nosepiece is our standard piece of equipment now. I wish you could compare ¾ lap paper coming out of this plant now with our competition, there's no comparison. That fellow was

talked to personally by both Charlie and Ross. He's now working in our Industrial Engineering Department. We've got a lot of talent here in the plant and I'm kind of proud of the fact that we're finding ways to use it.

The only other thing I wanted to mention in the line of Magnet Wire was Aluminum, and I'm not going to spend [fol. 5115] much time on it, except to tell you that unquestionably there's going to be a great deal of interest in Aluminum Magnet Wire with this price differential between aluminum and copper. It isn't the kind of product that you can go out and sell until the man that's using Magnet wire says he's interested in it, but if you haven't already heard that from your customers, you're going to hear it. But remember when those requests begin to come in that as of today, we have had more experience in the manufacture of rectangular Aluminum Magnet Wire than anybody else in the country, through the experience of working with the Westinghouse plant down in Sharon for the year and a half or two years when they were actually making aluminum wound transformers. I think that experience is going to hold us in very good stead.

I'm always supposed to mention the subject of complaints. This year I think our situation on complaints has been considerably better. I think our plant has done a grand job in correcting many of the things that needed to be corrected. I thought I'd like to mention a couple of instances that have come up this past year that show that complaint isn't always a bad word. We've had some complaints that I think have eventually worked out to our advantage and of course, to the advantage of the customer. These are complaints of the type where a study is instigated cooperatively between ourselves and the customer; the result in each case has been some improvement in what we're doing here, and a great deal of appreciation on the part of the customer for our co-operation. We are going through exactly that situation down at the Sharon plant of Westinghouse on rectangular copper, where they had a general complaint with all of their suppliers on the quality of rectangular copper. I think the work we've done with them was very much appreciated down there, and we know here that we've gotten a lot of good out of it—we're making a better flat wire today than we ever made. The same thing has

been true up at the Buffalo plant of Westinghouse on rods. We're now in a similar study down at Penn Transformer on the condition of Magnet wire reels and we'll talk a little more about that when we talk about Packaging on Friday, but there again, we've earned the customer's respect and appreciation and we've improved our own lot.

Well I'm not going to take any more time on these subjects, and I think I'll turn the next part of this section of the program over to Lew. He's got several things he'd like to cover. Lew Selden.

[fol. 5116] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 104

Rome Cable Corporation
1955 Sales Conference

"Our Industry—And Us"—A. D. R. Fraser

I feel somewhat apologetic about the fact that I have had to come to this meeting not as well prepared as usual. I hope sometime I will be able to enjoy one of these meetings and spend a little more time with you. There have been a few things going on, however, that have required my attention in other places. It is rather an important thing, I think, that represented at this meeting are 30% of the total shares of the Rome Cable Stock. So I may be a little bit rough in certain respects in some of the things I say, but it is being done in your interest as share owners and your interest as employees.

I would be indeed remiss if I did not very sincerely acknowledge the fine job that Glenn, Fred, Rudy, Mac, Bob, Dwight and several others have done in all the arrangements that were made.

I am a little bit disappointed in this meeting, at two things; one, that we haven't stressed a little bit more on how we are doing and I haven't found as much of the panel discussion as we did have in some of the other meetings. I always got a great deal out of getting information from you at first hand. It seems as though we in Rome have

had to do more of a talking job than in some of the other years. I know you have had a tough year and we had a lot of ground to cover and we have tried certain experiments, but that's just merely my impression.

Coming back to the matter of the figures. You knew about the budgets we made out for the year and the budget for the current fiscal year, that is April 1 to March 31, projected was up 15% above a year ago. Now those figures have been corrected to take care of the price increases, they have been corrected to take care of the copper increases and anything of that nature. Whenever those things happen, figures are corrected. Fifteen percent roughly in volume was expected to be the overall increase for the year. I am very pleased to tell you that we are doing a little better than that on the budget. Up through August, even with the shortage of copper, with all the things that you have heard that have been in our way, we are 3% ahead of that. You know, we don't just accept the dollar figures or the quantity figures on your sales projections. They are carefully reviewed by several here at Rome. We look at it as potential production, manpower, equipment and financial needs. We, as you know, also have an expense budget for each of the main departments this year and when you get all those things together, you may ask, "How are you going to do; how are you going to make out profitwise?" I am very happy to tell you that at the end of five months, we are running 10 to 15% better than we figured we were going to be by that time.

Now that's good, it is a good trend, but you heard quite a few pitfalls, potential troubles that can hit us with the situation in copper. It doesn't take very many million pounds of copper at 4¢ a pound difference, buying it at 47¢ and selling it at 43¢ to make quite a difference in the overall results.

The orders for the five months in the fiscal year are up about 28% or so above the same five months a year ago and we were beginning to have a pick-up in orders at this time about a year ago. The Kroeger order chart, with which you are familiar—the red line is that of industry generally, the blue line is ours. It is based on a moving average. One reason for our dip down here (reference to chart) is

because we haven't been able to enter all the orders we could have because we have only entered them on the basis of the orders that we have thought we had sufficient [fol. 5117] copper to produce. However, you see the general trend is up. We are apt to be more heavily affected than industry generally as we were here because of the inventory liquidation but now, as you see, we are well ahead of the pace on the inventory overall picture of industry.

Financially, we are very solvent as Harry told you. Harry made a new record in collections the other day. It was a million-and-a-half or so dollars in one day—a million-and-a-half dollars! You realize just about twenty years ago today, a little later than this, we were talking about how we were going to raise approximately two million dollars to start the Company. It is quite something to ponder on. Of course, they are different dollars, but they are the dollars that we have to work with. Let's not forget we still have a big debt of about four-million dollars, part of which was incurred for Torrance and part of which was incurred for consigned stocks. We heard something about consigned stocks earlier and you will hear more about this before I get through.

We might look at this almost twenty-year record—the sales in the first year were less than two million. This year we expect they will be well over 50 million, and the net worth at the beginning of the company was less than two million. By the end of this year, the net worth of the Company will exceed 15 million dollars. Our organization has, we believe, been strengthened during the year. You heard of some of the changes. There is no one who could be more delighted than I have been with the way in which the whole group has taken the bumps. Last year was a rough year. I think, frankly, we had about the poorest record of any wire company in the business and that is not normal for us. I told you the other day, that in 1938, when all the companies were losing money and we were only two or three years old, we were one of the few who made money, but there was a story back of last year. We were doing a lot of holding line. We got out of the small company-class. The influence of our policies and our actions could have made a much worse debacle out of last

year's results if we had chosen not to hold the line and not to try to get a better industry than we seemed to be having.

I haven't been around here as much this year. I have been doing a lot of traveling, not the kind of traveling that I would like to do to your districts, nor the kind of traveling out in the mill that I would like to do. I have had to do certain other special jobs. And I want to pay particular tribute to Jack who, as Executive Vice President, has been carrying on. I have delegated job after job to him. He has taken over well and taken off my shoulders a great many responsibilities and has done an outstanding job working with the other top people in the Company. I have absolutely no qualms about being away and doing some of the other jobs. I know that they will be carried on well and better than if I were here myself.

Capital expenditures—yes, we are still spending money. You see what we are doing to the old bare wire building, we are revamping it, we are also going to add to our aluminum production and what you heard about aluminum certainly indicated that there was need for some revision—some [fol. 5118] additional capacity there. Incidentally, we have spent approximately 11 million dollars or so on capital expenditures in the last 11 years and that is a pretty heavy pace for a company of our size in the ploughing back of the money that was made.

Employee relations have been good. We had troubles at Rome and we are currently having some potential trouble at Torrance, some more organization work, we don't know how it will come out.

During the year we announced a revision on the employee dividend plan and what we think is one of the most forward-looking pension plans that is in operation today, together with a profit-sharing trust. We haven't got all the details available on that. Those things have been worked out again on the old Rome Cable principle of endeavoring to get the best that we can within our ability to pay.

I was very pleased with the Engineering report. I like the way Bob said it. "Not much new in products but more and better with what we have." I think we went through a period of adding so much to our product line—we got a little bit ahead of ourselves and we had an awful lot of

headaches and an awful lot of troubles. I think what has happened in this particular period is that we have consolidated our position, we have worked harder on the quality end. The returns picture is much better than it has been, I think, since the Company started. We, on the other hand, from what you saw from Rudy, Mac, and Bob, have been working on other new things that are going to mean something in the future—but I again say let's not go off half-cocked until they are fully ready—until we have the equipment. Let's not promise things until we have got good assurance we can produce. Let's not go through another Tree Plex, another Rigid Conduit, let's be a little surer of our ground. And you know that I am a gambler, not to match up with some of you boys in your games around here, but in the business world, you know that I am willing to take chances.

Remember that laboratory exhibit which is very, very impressive and let us do a little digging into the fact that at the present time in Rome we have two-hundred product classes—two-hundred product classes: Each product class may have dozens and dozens of sizes and types of wire under them. Now I told you this last year, as far as I know, nothing has been done about it, but in that set-up, 35% of that number of product classes are giving us less than 6/10th of 1% of our total sales. These items individually total $12,000.00 per year. Now you can't make very much wire today on a thousand dollar per month total for a production class. When you go up to $24,000.00 a year, the figure goes up to 46% of the total number of product class or almost 100 product classes gives a grand total of less than 1½% of our business. Now I know that we take certain jobs because we want to get in with a good customer and to get experience in running certain products, but in this period of scarcity, in this period when the mill has a big problem of rescheduling to keep going for regular customers, can't we do just a little bit more on investigating of what is the value of spreading ourselves so very thin? I feel that there is a lot of "gold in them thar hills" and it would mean paying better dividends.

[fol. 5119] On the material side, it took 65¢ of the sales dollar last year to pay for materials and supplies. You heard Jack's story. It is going to be probably a larger

amount because of the higher price of copper this year. An excellent job of taking care of our material requirements has been done by Jack and Stan. The aluminum picture has presented problems. We think we have licked most of the problems of the production on the Properzi. You have heard of what we are going to do in expansion. The economics of aluminum over copper will mean further usage of aluminum. Then we hit the matter of supply. Then we hit the matter of how we are going to reconcile the economics. Gentlemen, I would not be very happy for Rome Cable to have the Company entirely on an aluminum production basis based on the present prices on a switchover from copper. It would be a very, very sad Company as far as returns were concerned. So we have got a lot of things to be done in that connection.

The plant re-arrangement has gone forward apace, the boys have done an excellent job in manufacturing, engineering, we are looking and already seeing the benefit of many of the savings.

Now there is one thing that I understood was said that I would like to take just a little bit of an issue with—and that was that anyone was certainly crazy to be in the conduit business. Well I had something to do with that. We were told back in '36 that we were crazy to get in the wire business again. Industry was operating at 30% or 35% capacity and I can remember a New York banker going through our plant in the late 30's and saying we should certainly get out of the rubber covered business. We can remember it took us 40 odd months to break even and yet shortly after that, the Rubber Covered Department carried the Weatherproof and Bare Wire Department through a bad price war. I can remember a little bit about the cost in rejects and high costs in getting into high voltage. I can remember rather vividly—rather vividly, the fact that last year, the building wire, which we had made for a long time in which we had two-and-a-half times the volume that we had at Torrance that we lost 200 thousand dollars on it. So I am not discouraged about the Torrance picture.

Volume, when we had it in certain months, showed the potentiality there. Glenn Kroger has done a fine job. Ted Lewis has done a fine job in getting us established with the

industry and establishing out reputation with competitors. I think the policies in the conduit business last year were much better than some we had had in the wire and cable business. I like Dick Gates' enthusiasm. They have got a grand bunch of boys who want to be on the team and are on the team and I think we'll give Torrance a blue ribbon in the not too far distant future.

What we have learned from the meeting? Well, I guess we had better go out of the warehouse business from what the McGraw-Hill boys told us so we had better save some money on some warehouse leases, inventories and consigned warehouse stocks. Part of that debt that we built up was at your behest and right at the Sales Meeting time two or three years ago, we authorized the equivalent of over 4 million pounds of copper to go into that. Because we were operating on LIFO that meant a switch in inventory which accounting-wise kept our value of copper in inventory at a relatively low figure. Let's not forget that when you do [fol. 5120] increase your inventory, or replace it, you are replacing it at a higher level and I was alarmed, as some of the organization know, about this climb to 600,000 pounds above the level authorized. What happened? In the period between June and August, as Jack told you, we lost 2,200,000 pounds of inventory, that went out at lower prices. It costs us quite a pretty penny. Replacement of that at 43¢ or 47¢ copper can well represent ¼ million dollars loss and if we are not able to replace that inventory on an overall basis, which we hope we can do before March 31st, Harry is going to have to dig up a little matter of over 250,000 dollars in additional taxes. The overall average of the cost of our inventory will move up 3 or 4¢ a pound so we mean what we say, it's your money you're dealing with when you give an extra amount on this consigned stock. I was amazed to find early in the year that we were getting about 1 and ½ times turnover on a lot of our building wire items. Because we had to have material going though the mill here, we had to have it in stock, we had to have it in transit to the warehouse, we had to have it in the warehouse and then we had to have three or four months in the hands of the jobber. Now that's not efficient. I won't go for this business of three months stocks with a consigned stock

where we have a warehouse also in that same city because in that event, you are going up to 4½ months stock in many cases and that is not good operation.

This question of inventories to me is an extremely important matter and it is extremely important that we get information back from you. If you find for example, that your customers are carrying too heavy inventories, get that back to the Sales Department so that we won't be operating overtime and then suddenly shut off.

Coming to our part in industry. Where do we stand? There are certain figures that are available. On copper, we have improved our percentage slightly this year despite the shortage, I mean our percentage of the overall total because of what Jack has been able to do. In building wire we are up slightly. We have about 3% of the total magnet wire business but we don't make a great portion of that product. It runs about 11 to 12% of what we make. We run about 5 to 8% of the NEMA power and control cable. Five percent of the portable cords, and on the overall with about 40 companies representing a major portion of the industry, on the items covered by NEMA, we run about 5%. We run about 8% of the aluminum covered wire business. On EMT 6 to 7% and in rigid 3%. Now, if we had a billion and a half industry, you have got some conception of where we stand from some of the figures that I have quoted.

Here you have the total of insulated wire and cable. (Reference to charts) These are NEMA charts and we have put the Rome Cable figures on them—the blue line is the Rome Cable—the black line is total insulated wire—the red line is total new construction—the green line is total electrical manufacturing industry and this goes up to 1955 and the figures to 1970 are going well above two billion dollars. You notice how the building wire follows the total of new construction here. Rome Cable figures fell off last year. You know why, but we are back on the trail again. Here is the trend of magnet wire business. Look how closely that follows the motors and generators sales, and the pos-
[fol. 5121] sibility here we are off a bit because the enameled types represented a larger proportion than the other type coverings that we make.

You have heard about the NEMA job that I have. I just want to touch lightly on that and some of the things

that we have been doing, some of the things that I think are helpful for the industry. You have heard about the IPCEA being responsible now for the standards. If we are successful in this program we will have some real standards in the industry and you know that that will relieve a lot of your headaches. Frank McKevitt has headed up a traffic committee. For the first time, the wire and cable and the brass fabricating industry are working together to make some very effective savings in freight rates. We have had all the labor relations people in the various member companies in NEMA together to swap information covering important matters in labor relations as far as the industry is concerned. We had Jay down there last week on a matter of analyzing cost systems with regard to what is considered overhead and how inventories should be carried. We are trying to make it easier to satisfy the Government on the matter of cost analysis.

We also had a meeting of statistical and market analysis group. Out of that I hope that we will have an industry that will be as well informed as any in the country. The companies are enthusiastic about some of the things that we have been able to do. Copper has been a headache, but there again, in its initial stages, we were able to work with the brass mill. For years whatever the brass mills did the wire mills would do exactly opposite. We have been working very closely whenever we have gone along on a program alone, we have kept them informed and same is true vice versa. From my trip to Washington last week, I believe that there will be and we have seen some actual results on copper. There is some possibility also that if we can get a law in effect on involuntary liquidation of LIFO that many million of dollars will be saved to the industry. LIFO at Rome Cable means over a 3-million dollar cushion of what we have at the present time.

Coming to the growth picture, let's look at, let's say, the almost 20 years of our Company. Twenty years ago, the gross national product which was the output of everything was 72½ billion dollars/ Well, the cost of government runs about that today. In 1945, ten years later, it climbed to 214 billion dollars. Today there is some actual predication that we may reach this year almost 400 billion

and by 1970, 567 billion. Electrical energy—(reference to charts)—electrical energy—remember at the start of Rome Cable, you have seen this chart before, we used it in our prospectus, we used in in the talk to Security Analysis, the production of kilowatt hours. We have capital expenditures of utilities on the green line. We have plotted the Rome Cable sales line as it actually has occurred in that period. We had a dip last year. Here is our estimated resumption of that line. This only goes to 1964 at some 800 billion—you carry it on to 1970 and you get a line that goes up to a new figure—a trillion-four-hundred and some odd billion kilowatt hours. Well, if this same story holds true, fill in your own figure.

[fol. 5122] The Federal Reserve Board index was at 47% in 1935, 107 in 1945, 136 today, and over 200 expected in 1970. Rome Cable Sales were nothing in 1935, 17 million in 1945, 55 million in 1955—what will they be in 1970 if we follow along that curve. Aluminum production 60,000 tons in 1935 almost 500,000 in 1945—a million-five in 1955 and 3½ million in 1970. Copper wire bars—259,000 tons the actual consumption of copper wire bars in 1935, was less than one-half what Rome Cable has consumed in the period since we have been in business, 570,000 tons in 1945, 800,000 tons in 1955, but their predictions on the usage of copper in 1970 do not climb anywhere near the way any of these other items.

You heard what the McGraw-Hill boys said about the potentialities of business. All of the things that are going to add up well for the wire industry. You have at your places, passed out before, a very fascinating story of forecast by the McGraw-Hill Electrical World staff from 1955 to 1970. You men of the Sales Department take it to heart and think of the potentials that you have ahead. You men of the factory take a look at it also as to what kind of plans we are going to have to make in order to meet that kind of demand.

But let's not be carried away entirely, let's approach this thing with care. I was not too young but what I heard the wail of the new plateau by many bankers, and many industrialists in the late 1920 period. I well recall that book that was published in 1933 by the very interesting title "Oh Yeah!" in which the quotes of these men

prominent throughout the country were given and it certainly was rather a sad picture, so there are a few things on the horizon that can cause trouble. These inventories can get out of hand. I believe that we have enough brakes on our economy today to cause us not as much concern. I believe the long term trend is well plotted but it behooves us as a company and each of you as a representative of the company to be on your guard. Let's remember '54. A lot of companies were having a pretty good year in '54. They didn't get the dip that we did. We went through some pretty rough times. By being on our guard, by doing some of the things that have been so ably discussed and talked about at these meetings this time and not forgetting them when we leave this room, we can learn a lot from 1954.

I go back to Jerry's remark about "Why should I worry about the thing, that's for the boys at the head office", but many of you are shareowners. I don't like this worry angle, I say "think" is a little better. Let's all of us do a little more thinking about our job and what we can do, let's use our heads a little more.

The matter of the fair advantage was quoted. Charlie Ellis and Jay Sarles remember a little bet that I had with them where I said, "I'd like to have a fair advantage" and the matter was indicated that we don't need a fair advantage. We do have a fair advantage. We have got this organization harmoniously working together. We have got the equipment. I hope you are all as proud as I have been during these last few days to hear the number of times that your Company has been mentioned as being first in this, first in that and it ran over a whole range of different things. The fair advantage is the reputation that you men have made for the Company. That, to me, is a real fair advantage in any selling job. We have had a success story that is envied. Let's keep it that way. As Harry Barnard said in his story, "Interesting, ain't it?"

[fol. 5123] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 105

Mr. W. A. Miller—Phila.
Mr. G. E. Rolston—Rome
December 7, 1955
Philadelphia Electric Co., F.O. #A-14095

Dear Bill:

I have your memo of December 5 relative to the above mentioned order number and particularly with regard to the feeling that this customer has that our promises on this class of material are not reliable. I quite agree that they have every reason to feel this way and the information that I am going to give you is not in the nature of an alibi because we as a company are responsible for the promises and items that we agree to take. I do feel, however, that I should tell you quite frankly about this situation and properly tell you what we are doing to correct it.

In the first place, this plant has not been set up to draw aluminum wire in size smaller than .061. We only had one drawing machine set up for aluminum and was put in for the express purpose of making conductor to go into line wire and Triplex and as you know, the smallest size of individual wire strand going into those products is the size of strand into #6 AWG. About a year or year and a half ago, we were approached by the Aluminum Company of America to make some of the smaller sizes of stranded wire for them with TW insulation and in some cases, with RoMarine-RoPrene. Because of our other commitments and the insulating of their conductor, we felt that we could not refuse to do it and we set up purely on a temporary basis one drawing machine to produce some of the smaller sizes of wire. Our experience under this set up, of course, has been very unhappy and we have not done a good job on orders for this size from your customer nor have we done a good job for the Aluminum Company. Unfortunately our whole organization has not been completely aware of this situation and we now find that you and we are embarrassed by poor per-

formance on this particular type of wire. I will not attempt to go into all the other problems on discussions that have taken place with regard to outside diameter and tolerance, etc. because I am not qualified to do so and it would take an hour or two to try to reconstruct what has transpired, consequently, I am talking only actual making of the stranded conductor itself and in the case of this particular order that you are talking about, over one [fol. 5124] month of the delay has been caused due to that one source.

You now properly come to the question of what are we doing about it. I think we intimated to you at the time you were here at the Sales Meeting that we realize that we are going to expand our activities in aluminum wire and we told you of the new plant that we were building and the fact that we are putting in equipment to make a full range of sizes. This means that we will have not only the one original rod machine which was in our old set up but an additional intermediate drawing machine and twelve fine wire drawing machines. This work is pretty well along and I would say that in the next six weeks or so we would have a complete new operation for the drawing of the finer sizes of aluminum wire. I am sure that as soon as we get more and more experience in drawing these finer sizes that our difficulties of the past will either be eliminated or greatly minimized. I feel quite sure that we can convince you as well as any customer after we have set this thing up properly that we can do a job and keep reasonably close to promises which we make.

As I said at the outset, this is not going to solve the immediate situation but at least indicates that we are conscious of the fact that in order to take on items that are required by the trade that we must have a mechanical set up and the proper equipment to do it. I will have to speak for myself in this case when I say that I was distinctly opposed to trying to take on orders for products that were not within the scope of our mechanical equipment at that time and I think the results that we have had during the past months demonstrate just what has happened where we do take a gamble on some kind of a temporary set up.

I do not expect you to pass this information on to the

Philadelphia Electric Company at this time but I do believe that when and if we have this complete installation going that we will be able to convince them that our capabilities are well in hand and possibly we can convince them that we should be given another opportunity.

Very truly yours, ——, ——.

PLAINTIFF'S EXHIBIT 106

A. D. R. Fraser
R. A. Schatzel
December 8, 1955
1955 Developments

1) Butyl Rubber

The desirable properties of this material has long been recognized. The difficulty of its processing has been a problem to overcome. Some of this has been due to non-uniformity in the rubber as received. This shows improvement which we hope continues. Compounding to fit existing equipment has also been a problem, and cannot be completely accomplished without mechanical changes and adjustments not required by other types or rubber.

We have made real progress in the understanding of these problems and have made progress in equipment and compond adjustments to enable us to manufacture orders for both high-voltage and R.H.W. insulation. With the adjustments in equipment now under way, solution to this problem should be accomplished.

2) Aluminum

Progress in the casting, rolling and drawing of aluminum has continued. We have drawn aluminum wire to #30 AWG and fabricated it into flexible welding cable, which is being evaluated by Lincoln.

Study of connectors for such cable is being made by both Rome Cable and the Lincoln plant.

Once again the use of aluminum Magnet wire is re-

ceiving attention, which will undoubtedly result in an increased selective use where engineering studies justify. We are in position to supply if evaluations or changes in economics can justify.

3) Mining Cable

The mining industry again is moving forward. We have developed an improved mining machine strand and cable within the present dimensional limits, and at little change in cost, which should go far to satisfy the demand of several years for a more sturdy and reliable cable for mining equipment.

4) RoFlex

Throughout the years there has been periodic complaints of lack of flame resistance, sticky wire, flaking at freezing temperature, dirty wire to handle, etc. on Nonmetallic sheathed cable. Working with our supplier we have developed a finish which meets all requirements of performance and appearance. We are producing about [fol. 5126] 40% of our production at present and will be in full production when equipment is available in February.

5) Magnet Wire

We are accepted as one of the leading manufacturers of quality large round, rectangular and flat Magnet Wire; Paper, cotton and glass covered. We have never made enameled Magnet Wire. Within the past two years many of the problems of film coating large flat and square Magnet Wire have been solved. The synthetic enamels are tough and heat-resistant to a degree sufficient to warrant their use without other covering.

Film coated Magnet Wire for certain uses is replacing flat and square Magnet Wire to the extent of about 25%, and continuing to grow. In addition the use of film coated single glass covered wire is growing for some uses as replacement of double glass. It is therefore necessary for us to consider either equipping or to obtain a source of suitable enameled bare.

Study of enamel types and of equipment requirements

has been started. The field of enamel development is as broad or broader than the field of synthetic rubber, and while there is no single enamel which satisfies all needs, we believe by prudent judgment a single type covering can be selected to cover the basic requirements we will need.

6) Silicone Rubber

There has been much progress in the development of these materials. Dow Corning have been recognized this year by the Chemical Engineering Industry for their outstanding achievement in building a laboratory curiosity (Bouncing Putty) into a going business in the space of 12 years. A growth from 50,000 per month to 6,000,000 per month in that time and still in its infancy.

The U.S. Navy has standardized on it and are endeavoring to have the British Navy do likewise. We are an approved supplier of such cable to Navy. We have manufactured one order on a plant trial basis. We have been complimented on its quality by the Navy. Further improvements in our methods have been made and work with the Navy has been invited by them to enable us to provide other types.

[fol. 5127] In addition to Navy, certain industrials are finding limited use for Silicone rubber insulated cable. This represents a new field of chemistry which will grow as our knowledge and Technology expands.

Alcoa Pig

This afternoon I talked with Jess Willard of Alcoa's Albany office and requested him to supply us with 400,000 lbs. of aluminum pig for each month of the fourth calendar quarter. Jess said that he had not yet been able to get approval of the 300,000 lbs. October order which we sent him.

At the present time Alcoa gives the Albany office only 600,000 lbs. a quarter to distribute in the pig or ingot form. We have been getting about 80 per cent of this. We have recently been able to get 300,000 lbs. a month owing to the relief the aluminum industry has been able to get from Government stockpile.

Jess made it very clear that in his opinion we should look towards another source. I explained the difficulties of trying to get a now supplier at a time when metal supplies were at an all time scarcity. He agreed with this but stated that Alcoa was not very anxious to sell aluminum pig. They wish to use their aluminum in more fabricated products. He stated that our requirements had jumped to such an extent that he could not see how Alcoa could take care of us. I explained that their requirements on us for wires and cables had jumped in the same way and that we were doing everything to meet their needs.

Mr. Wilmot has recently returned from a trip to the Connecticut Valley and was amazed at the projected plans of expansion which would demand large quantities of aluminum. In Jess' opinion there is just not enough production in the United States to take care of the requirements in the foreseeable future.

I asked Jess to relay our request to Pittsburgh at the

earliest possible time. He said they would definitely not sell aluminum pig on a firm price basis. I brought up the fact that we had tried to place firm orders with Bill Stout between June 27th and August 1st, and Jess replied that he could not have accepted any during this period.

Ralph Davies is at present on the west coast and will not be back until after Labor Day. Jess suggested that Ralph should come to Rome shortly thereafter to discuss our mutual plans. Jess also intimated that he would like to be here at that time but I made no commitment.

PLAINTIFF'S EXHIBIT 108

Notes on Visit of Messrs. Ralph Davies and Phil. Coffin to Rome on Oct. 4, 1955

Messrs. Davies and Coffin, together with Messrs. Willard and Stout of the Albany sales office of ALCOA and three other Pittsburgh representatives were in Rome yesterday.

Messrs. H.T. Dyett, J.H. Dyett, G.E. Rolston and A.D.R. Fraser met with the first four mentioned in the morning, at which point the main discussion was their ability to take care of our requirements for aluminum pig. We were asking for 400,000 per month for the last three months of this calendar year. Ralph Davies explaining the extremely critical situation in which they found themselves owing to a fall-down of ALCAN in supplying aluminum to ALCOA on their contract. He indicated that our usage of 400,000 pounds per month is an increase of 100% over our earlier requirements and that they did not have the metal. He indicated that they would endeavor to give us 900,000 pounds for the last quarter, which would mean 400,000 pounds in October and 250,000 pounds each in November and December. We indicated that not having made any efforts to get additional suppliers we were in a bad position with aluminum in short supply to get on the books of other suppliers and furthermore that even if we were able to get some metal we had to make certain tests

as to practicability of running. After much discussion it was finally agreed that they would supply us with 400,000 pounds in October, 300,000 pounds in November and that Mr. J.H. Dyett would make efforts to get some additional metal by December from other sources. Mr. Davies stated that they definitely did not want to be 100% supplier to anyone and made no commitment as to the percentage he would like to have of our business. I believe we can count on 300,000 pounds per month through the first calender quarter of 1956.

[fol. 5130] It was indicated that aluminum is available on the Black Market and also that if we were able to pick up ordinary grade aluminum that possible arrangements for exchanging same for EC ingot could be set up.

We then went to lunch.

In the afternoon with Messrs. Davies and Coffin from ALCOA and Messrs. Rolston, J.H. Dyett and Fraser from Rome we discussed their requirements from us and how their program of production was planned. Mr. Coffin indicated that the first extruder for Polyethylene will not be available for delivery until late spring 1956. This was confirmed by Mr. L.T. Guest in conversation with Mr. Schatzel who stated that they would not be in production on Polyethylene for eight to nine months. Coffin stated that their second extruder would be available in August. Their twisting equipment would not be delivered for approximately one year. They are able to twist a limited amount of smaller sizes of Triplex in Massena now on a costly basis on a cabler. Therefore, we will continue to get Polyethylene business in sizable quantities for the next eight or nine months and it will be at least a year before they manufacture all of their Polyethylene. For the full year we will continue to get the larger sizes of Polyethylene that has to be twisted, On Neoprene they stated they have no idea of adding facilities for Neoprene and if they were asked to make a guess they would say at least two or three years and possibly never. This was also confirmed by Mr. Guest separately in conversation with Mr. Schatzel. They seemed to be questioning their ability to handle Neoprene. On Mr. Coffin's statement that they would have liked to have given us orders for 7,000,000 feet of conductor for October and November, because they needed

[fol. 5131] it for stock, I brought up the subject of their sizable stock increase of 50% since the end of July and that the walls of our shipping room were bulging with material. This seemed to surprise their entire group. I also indicated that we had produced for them in September approximately 8,500,000 feet and we had also made certain insertions in our production schedule at a penalty to our own customers' service when it was obvious that they could have substituted the running of that material rather than making it for stock. I tried to make this a very emphatic point with them and reverted to their conversation of the morning, that they be realistic in their demands if metal was as short as was indicated in the morning we did not feel it should be put towards increasing inventories. At that point because Mr. Coffin was at a loss to account for the sizable increase in inventory he called in their scheduling man Mr. Kehew. When I asked him the question as to what their actual needs for the period ahead without building stock, he indicated that 3,500,000 ft. would be adequate. I then stated that it would be helpful to both parties if they would review their requirements carefully and give us a revised estimate and that we would then check our production facilities and if we were able to give them any additional quantity we would so advise them. We did not consider it good practice on our part to have to run Saturdays and overtime to build stock for them which might mean reduced requirements in the near future as their over-estimates in inventory had done to us in the past. I indicated that on Neoprene insulating for the first nine months they had ordered an average of 2,760,000 feet per month and we had produced an average of 2,725,000 feet. On Polyethyelene they had ordered 2,170,000 ft. average per month and we had produced 2,170,000 ft. average per month and on Triplex they had ordered 1,200,000 ft. average per month and that we had produced 1,320,000 ft. This indicates that with the heavy production in September we have brought ourselves up-to-date on their requirements despite sizable increases in demand.

[fol. 5132] On the matter of their increased stock at Rome they stated that increases unfortunately were in less active sizes but they agreed to take prompt action on shipping sizable quantities to Massena.

I then asked them what their views were on entry into the building wire field. Mr. Coffin stated they had hired a special consultant in an electrical engineering firm in New York to make a full appraisal and study of the building wire question and give them a report on aluminum wire versus copper. He indicated that because of Kaiser's entry into this field and what he believed this report would show they might be coming to us to make aluminum building wire for them.

I then asked them about power cable. Phil. Coffin being an old utility engineer stated this was a subject dear to his heart and that their salesmen were getting increasing inquiries about the possibility of their supplying power cable. He stated that they have kept away from the subject but they did not know how long they could, but this would require considerable study. I pointed out to them that expecting us to make either building wire, and particularly power cable, was something that could not be undertaken over night and that a full appraisal of the impact on our facilities and extent to which we would become involved was an important consideration for both companies.

A number of policy matters were discussed. I spoke a word for their joining the Wire & Cable Section of NEMA and Phil Coffin asked if we knew of any technical production man who might be anxious to be superintendent of their Massena plant.

[fol. 5133] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 109

October 5, 1955.

To: Mr. Ralph V. Davies, Vice President
Aluminum Company of America
1501 Alcoa Building
Pittsburgh 19, Pa.

Dear Ralph:

First, I again want to say that we appreciated Phil and you coming to Rome yesterday.

As in the past, while not having any formal contract I think it well to summarize briefly certain decisions and programs that we talked about so that unfortunate misunderstandings can be avoided in the future. I would appreciate it if after reading this letter, and having had an opportunity to talk with Phil about it, if you would advise me that you agree with the letter or at what points we are at variance.

If Rome had started looking a month ago, they could have obtained metal from K and R, both of whom were soliciting business up to about 9/1.

First, we understand that you do not wish to be a 100% supplier of pig to us and now that we know this we will diligently endeavor to secure other sources. You agreed to supply us with 400,000 pounds of pig in October and 300,000 pounds in November. We did not settle on the exact December amount but my suggestion was that you try to give us 300,000 pounds and that we endeavor to get supplementary supplies to relieve your commitment of 300,000 pounds up to the extent of our ability to get 100,000 pounds between November and December, delivery to us. We understand that you will take care of us to the extent of 300,000 pounds per month for the first quarter of the calendar year 1956. We will also try to improve our supply position from other sources in that period.

No such understanding. We *hope* to help them to this extent.

In the discussion we stressed the importance to us of this transition period where we have not been on the books of other suppliers, because we had been getting 100% of our requirements from you. Our problem is compounded not only from the shortness of the overall supply of the metal and heavy backlogs in the hands of other suppliers but also because we will need lead time to experiment with quality of other suppliers' metal.

Should be good quality, based our past observations.

In the matter of your requirements from us, we understand that delivery of your first plastic extruder will not come until late Spring and the second machine in August and therefore you will be looking to us for full Polyethylene [fol. 5134] supply for the next eight or nine months and on large sizes of Triplex for a full year. You indicated that your requirements for Polyethylene would go steadily downward from late Spring and probably be ended by August or September of 1956.

We may have to lean on Rome indefinitely for fringe requirements.

You indicated that you had no present thoughts of doing any Neoprene insulating and the guess was made that it might be two to three years as the shortest time that you might even consider it and it would require additional time thereafter to get into production. We, therefore, are expecting and planning to supply your Neoprene insulating requirements at recent current levels of 3,000,000 to 3,500,000 feet per month. This is on a reservation basis. We will continue to twist all Neoprene insulated material.

We actually insulated well in excess of 5,000,000 feet of Neoprene in September. We stressed, however, the importance of getting any advance information on sizable increases because of limitations that could come up in compound mixing. Providing additional facilities for compound mixing might become a major capital expenditure with us, as well as a long lead time to get delivery of equipment, which emphasizes the importance of the second paragraph under 3. of the original memorandum of agreement between our two companies. In other words, if we have to acquire additional facilities that we be given the request so that we can advise you within 30 days as to

decision to make such an investment and what sort of extension of period of the old agreement would be required.

We understand that you are studying and have studied the subject of building wire and that when your studies are more definitive that you may ask us to manufacture building wire, or decide to go into the manufacture yourself, but in any event you would advise us of your decision.

I also raised the question of your view on Power Cable and here again we were told that you had a considerable amount of interest being expressed by customers but that you would discuss the matter at some later date with us as to your feelings. We stressed the complications involved in getting into production of a product as complex as Power Cable and the further strain on our facilities if we should be asked to provide Power Cable for you without adequate planning and sufficient lead time. This matter affects not only our and your manufacturing but the engineering and training of sales departments for proper customer contact.

[fol. 5135] We discussed sizable stock of your product here at Rome and asked for some relief as it has been increased 50% in the last two months. With approximately 5,000,000 feet now of finished stock in Rome our storage facilities are being overly taxed and we hope that some of this can be shipped to Massena or direct to customers. We also stated our desire to cooperate with your need for increased quantities and it was agreed that you would review your actual immediate needs and we would endeavor to tell you how much additional we could take on towards reaching the inventory build-up that you felt necessary. We have certain reserve shifts on equipment but would only be desirous of opening these up if the demand warranted it for at least a two or three months period.

We discussed this on the plane. This was the result of misunderstanding in paper work.

I believe this outlines the major significant items and while I do not like long letters I feel that the discussions were of such importance to both companies that it is well to be sure that we have no misunderstandings. I am sending you an additional copy of the letter in case you want to give one to Phil. Coffin.

As always it was nice seeing you and we appreciate the effort you made to come to Rome.

With kindest regards.

Sincerely, ADRF, President.

ADRF/m

Aluminum Company of America

Pittsburgh 19, Pa.

October 12, 1955.

Ralph V. Davies,
Vice President.

Mr. A. D. R. Fraser, President,
Rome Cable Corporation,
Rome, New York.

Dear Ross:

This will refer to your letter of October 5 on which I probably should make a few comments.

First, in the third paragraph of your letter you relate your understanding that we will take care of you to the extent of 300,000 pounds of pig for the first quarter of the calendar year 1956. You may recall that when this subject was discussed Mr. Coffin pointed out that our books were not open for pig orders for the first quarter at this time. I think, therefore, it would be more proper to say that we hope to be able to help you to this extent.

In the fourth paragraph you comment on the quality of other supplier's metal for your needs. Based on past observations, we believe you will find the quality satisfactory.

The first paragraph on page 2, regarding polyethylene supply, might be amplified by the statement that we may count on Rome indefinitely for fringe requirements.

Going now to the first paragraph on page 3 of your letter—Maybe your people have told you by now that the exceedingly large stock of finished material on hand at Rome was due to a misunderstanding connected with paperwork. This large stock was called to the attention of other [fol. 5137] members of our party while they were out in the plant, and Mr. Coffin and I were told on the plane coming home that this misunderstanding was promptly corrected and shipments to alleviate the situation could be made.

Thanks for the courtesies extended to us on our visit and for the fine luncheon. We enjoyed our visit with you and your associates and had a pleasant return trip.

With best regards,

Sincerely yours, Ralph.

Mr. Ralph E. Davies, Vice President,
Aluminum Co. of America,
Pittsburgh 19, Pa.

Dear Ralph:

I should have mentioned that the 300,000 pounds of pig per month for the first quarter of the calendar year 1956 was on the basis that you hoped to be able to help us to that extent.

We have been working overtime to get out the heavy specifications on stock shipments which we received after misunderstandings on paper work were cleared up.

In reading your comments on my letter of the 5th we are very pleased to know that our meeting of the 4th resulted in such complete accord of the matter covered in my letter.

With kindest regards.

Sincerely, ——, ——, President.

PLAINTIFF'S EXHIBIT 112

cc: A. D. R. Fraser, S. O. Williams.

cc: Mr. R. Murray Willard, District Sales Manager, Aluminum Company of America, 90 State Street, Albany 7, N. Y.

October 21, 1955.

Mr. W. S. Stout,
Aluminum Company of America,
90 State Street,
Albany 7, New York.

Dear Bill:

Stan has showed me your letter of October 14th, and we thought it best if I answered it as I have been doing the rounds of the aluminum suppliers.

When Ralph Davies was in Rome on October 4th we reviewed our requirements and indicated that we would endeavor to get on someone else's books as soon as possible. Since then I have talked with three suppliers and have been unable to get any aluminum pig prior to January 1st. They are also not ready to talk about the first quarter.

In view of the above we hope that our December orders from you will total 300,000 pounds. This is in line with Ross Fraser's letter to Ralph Davies on October 5th which stated as follows:

> "We did not settle on the exact December amount but my suggestion was that you try to give us 300,000 pounds and that we endeavor to get supplementary supplies to relieve your commitment of 300,000 pounds up to the extent of our ability to get 100,000 pounds between November and December, delivery to us."

We have been unable to do this and, therefore, trust that you will be able to ship us the full 300,000 pounds.

In spite of the above, you may rest assured that we shall continue doing everything possible in order to get additional aluminum pig before the end of the year, but as

we suspected this is the worst possible time for us to begin to swim.

Best regards.

Sincerely, ——, ——, Executive Vice President.

[fol. 5140] In United States District Court

Plaintiff's Exhibit 113

To: A. D. R. Fraser, R. A. Schatzel, S. O. Williams.
From: J. H. Dyett.

Date: October 21, 1955.
Subject: Aluminum.

I am attaching copy of a letter sent to Mr. Glass of Anaconda. On October 18th I was talking with Mr. VanAlstyne, President of Aluminum Limited Sales who stated that they were extremely short of aluminum because of a landslide at Kitimat and lack of rain at their Saguenay property. He admitted that we were a good location and that they would get in touch with us as soon as they had anything available. He believed they were shipping some Boronized pig into this country but did point out that there might be some exploration of the tariff problems necessary.

Mr. Robert Belknap, New York Sales Manager of Kaiser appeared to be the most anxious to sell us. He did not think that they would have anything except rods prior to the first quarter. In respect to this period he will have to get in touch with us. He seemed most anxious for me to meet Mr. Inch when I was on the coast and indicated that perhaps something could be done out there.

The net result of my visits was to emphasize the scarcity of aluminum at the present time. Although no promises were made I do not believe it will be too many months before we can make at least a start with Kaiser. ALCAN and Anaconda will be much tougher to crack.

Jack.

October 21, 1955.

Mr. Clarence Glass,
Anaconda Company,
25 Broadway,
New York 4, New York.

Dear Mr. Glass:

Your courtesy last Wednesday was most appreciated even if you could hold forth no hope of our getting any nearby aluminum. We understand at the present time you are not in a position to supply aluminum to our specification which is 99.55 E.C.H. Boronized aluminum pig. We do hope, however, that it will not be too long before you will be into this grade of aluminum.

Although you are not in a position to supply us at the present time we are wondering if there is any possibility of your supplying us with an aluminum of a lower grade for delivery to a point no further east than Chicago. If this is possible we should like to get information from you as to the availability of 50 to 100 tons of this material in the hopes that we could make a switch.

We are very anxious to become a customer of Anaconda in aluminum as well as in copper. We understand the many difficulties in getting started, but hope that it will not be too long before you will be as anxious to sell us as we are to purchase.

Sincerely, Rome Cable Corporation, ——, ——, Executive Vice President.

November 18, 1955.

Mr. R. Murray Willard,
District Sales Manager,
Aluminum Company of America,
90 State Street,
Albany 7, New York.

Dear Jess:

In answer to your November 10th letter, I have just returned from a California trip, consequently the delay in answering.

Ross will definitely be in Rome on December 1st and possibly the afternoon of November 30th. If there is any way you could rearrange your schedule it might be better to be here on the 1st, but he will make every effort to be in Rome on the 30th, in the event your schedule is inflexible. We shall look forward to seeing both you and Mr. McKee.

Bill was in to see me, and I gave him the sad story of our first attempts at swimming in the aluminum pond. As we expected, no other supplier finds us particularly attractive as a customer for the foreseeable future. It begins to look as though we shall have to depend upon you for our full requirements for at least the first quarter of 1956. You have probably heard of the increased demand for cables on your own company, so that you can well imagine that holding us to 300,000 lbs. a month is going to be a distinct hardship. In view of the situation we hope that you can be somewhat more generous. As one potential aluminum supplier told us, we could have been in the picture by now if we had been in a position to purchase metal during the first half of 1954. I guess our respective timing has been rather bad.

We shall look forward to seeing you week after next.

Sincerely, ——, ——, Executive Vice President.

JHD:AS

[fol. 5143] P.S.—Can we make reservations for you at the Green Lantern? We are hoping that you will have lunch or dinner with us—or better yet, both of them.

[fol. 5144] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 116

To: A. D. R. Fraser.
From: J. H. Dyett.
Date: November 22, 1955.
Subject: Kaiser Aluminum.

When I was in Oakland I met the following Kaiser personnel:

Messrs. D. C. Rhoades, Vice President & General Manager.
Tom Ready, Vice President in Charge of Operations.
Ford Lovelace, Mr. Inch's assistant in sales.

They all appeared to have considerable faith in the growth of the aluminum wire and cable business. Ravenswood should be in big production by 1957. I told them we should like to start very shortly at 50 tons a month and progressing at the earliest possible time to 100 tons per month. They would make no commitments but urged that we see their Chicago people. They seemed to know quite a bit about our company and Alcoa's plans of going into Polyethylene. They emphasized what a cheap purchase their Newark plant had been. Mr. Ready was amazed at Cerro de Pasco's buying of Circle. He stated that if Kaiser had known, it perhaps would have been interested in purchasing the company.

In Chicago on November 16th I met with Gillette Houck, Carl Ferguson of the electrical conductor office, Don Walker, and his assistant Verne Lorch, in the office of sales of pig and ingot, Maurice O'Halloran in charge of rod sales, as well as John Menz, the General Sales Manager. Mr. Walker stated that the first quarter was probably out but that they might possibly make a start with us in the second. He emphasized that the fourth quarter government relief must be replaced by April. He said that it was too bad we had not tried to buy from them earlier in 1955 since we would now be in their picture. Anything they could give us at the present time would have to be at the expense of their other customers. Mr. Walker also said that 1956 looked bad and that 1957 looked even tighter. After hear-

ing this story Mr. Menz tempered it somewhat by saying that it was hard to look ahead in the metal business and that he thought something might develop before anticipated. I told each one of them that we were most anxious to have Kaiser as a supplier but that in our opinion we would not have to wait to get suitable sources as long as 1957.

In line with my visits in Oakland and Chicago you might be interested in what American Metal Market November 18th issue stated: "The total aluminum supply including primary, secondary and imported metal for 1956 will amount to 2,350,000 tons. . . . . Net year requirements, exclusive of any stockpiling calls, will run from 2,050,000 to 2,150,000 tons." These are guesstimates made by a panel consisting of Mr. Nash from Alcon, Mr. David Reynolds of Reynolds Metals, Mr. Wilmot of Alcoa and Mr. Rhoades of Kaiser.

Jack.

PLAINTIFF'S EXHIBIT 117

December 2, 1955.

Mr. John L. Loeb,
Carl M. Loeb, Rhoades & Co.,
42 Wall Street,
New York 5, New York.

Dear John:

Armand certainly sent Mr. Trefethen a most helpful letter. For your information, Kaiser has sold us 50,000 lbs. of aluminum rod. Although this is not the type of material we wish to purchase it will help us through a tough period in January. It is our hope that it will not be too long before Kaiser becomes a supplier of aluminum pig.

We continue to have our problems in getting enough

copper, but it looks as though operations for both December and January will be at satisfactory levels.

We do not expect to be in New York again for any length of time until mid-January at which time we are hoping you and Peter will reserve an evening for us.

Sincerely, ——, ——.

Enc.

ROME CABLE
CORPORATION

ROME, N.Y.

REPORT SUBMITTED TO THE BOARD OF DIRECTORS OF ROME CABLE CORPORATION AT THEIR MEETING DECEMBER 13, 1955

I present herewith net sales and earnings by fiscal years up to March 31, 1955, and by quarters for the current year, the month of October and estimates for November:

Fiscal Year Ended	Net Sales			Earnings
March 31, 1937	$ 1,798,092			1,616
March 31, 1938	4,957,103			71,027
March 31, 1939	5,370,665			245,036
March 31, 1940	6,080,902			297,736
March 31, 1941	9,468,451			431,501
March 31, 1942	11,631,785			592,135
March 31, 1943	12,712,333			367,654
March 31, 1944	16,909,735			446,709
March 31, 1945	22,798,218			486,653
March 31, 1946	16,975,009			398,973
March 31, 1947	18,436,305			1,359,593
March 31, 1948	25,202,853			1,152,579
March 31, 1949	26,088,523			1,115,960
March 31, 1950	19,602,984			302,209)
		Plus: Transfer from contingency reserve		150,000) 452,209
March 31, 1951	35,142,901	Net	$ 1,922,136	
		Minus: Transfer to copper reserve	150,000	1,772,136
March 31, 1952	42,657,848			1,753,651
March 31, 1953	54,632,976			2,008,321
March 31, 1954	44,114,825			1,637,787
March 31, 1955	39,186,095			930,879
April-June Quarter	11,687,152			379,847
July-Sept. Quarter	13,931,255			471,316
Total Six Months	25,618,407			851,163

[fol. 5147]

ROME CABLE CORPORATION

Fiscal Year Ended	Net Sales	Earnings
Total Six Months 1955	$ 25,618,407	$ 851,163
October, 1955	5,185,657	187,248
Total Seven Months	$ 30,804,064	$1,038,411
November, 1955 (Est.)	4,569,000	160,000
December, 1955 (Est.)	5,337,000	194,000
Total Third Quarter (Est.)	15,091,657	541,248
Total Nine Months (Est.)	$ 40,718,064	$ 1,392,411

EARNINGS

November showed a drop in sales volume of approximately 10 per cent below October, largely due to lateness in copperarrival, which will be made up in December and bring the total dollar volume of sales for the quarter to a new high. Present trends indicate a net earnings picture somewhere between $1,900,000 and $2,000,000 for the year. Of the seven months earnings in the current year $923,000 came from Rome operations and $115,000 from Terrance. Total for both plants is more than double the results of the previous year.

SALES

The breakdown of sales before deduction for discount and freight from April to November 30, 1955, with November figures estimated, are given below:

	April -November 1955	April-November 1954	% Increase or (Decrease)
Rods	$ 4,268,000	$ 3,513,107	21.5
Bare	6,175,000	4,190,460	47.4
Weatherproof	2,295,000	1,655,069	38.7
Magnet	2,486,000	1,745,700	42.4
Rubber Covered	14,015,000	10,026,234	39.8
Terrance -E. M. T.	1,997,000	1,632,401	22.3
Rigid	1,804,000	1,154,354	56.3
Spiral 4	1,230,000	822,545	49.4
Aluminum	2,695,000	1,766,835	52.5
	$ 36,965,000	$ 26,506,703	39.5

On the basis of equivalent copper for the two periods the current year increase would be 25 per cent above 1954.

We estimate that the fiscal year in physical volume will be 40 per cent above 1954 and about 25 per cent on the same copper basis. Actual production increase in the current quarter is much greater than the 7 per cent of sales increase levels because of the heavy inventory liquidation that occurred in the July-September quarter.

[fol. 5148]

ROME CABLE CORPORATION

BACKLOG OF ORDERS

		Value
Jan. 2, 1955 - Rome -	Wire Products	$ 2,287,000
	Aluminum	338,000
	Spiral 4	1,845,000
-Torrance-	E. M. T.	38,000
	Rigid	19,000
	T. V. Mast	-0-
		$ 4,519,000
June 30, 1955 - Rome -	Wire Products	$ 3,472,000
	Aluminum	731,000
	Spiral 4	1,435,000
-Torrance -	E. M. T.	77,000
	Rigid	153,000
	T. V. Mast	13,000
		$ 5,881,000
Nov. 30, 1955 - Rome -	Wire Products	$ 5,605,000
	Aluminum	776,000
	Spiral 4	615,000
-Torrance-	E. M. T.	308,000
	Rigid	37,000
	T. V. Mast	184,000
		$ 7,525,000

The above figures on backlog of orders show a steady rise during the year, with the exception of Spiral 4 contract which expires next March. We have made a bid on requirements for next year but have not heard the results.

Incoming orders for the first eleven months of the calendar year show a 48 per cent dollar gain in total over a year ago for Rome plant and 39 per cent for Torrance. On poundage of copper orders are 18 per cent ahead of a year ago and orders received on aluminum 78 per cent.

COPPER

Since my last report copper sold by the principal domestic producers has remained at 43 cents per pound. On the other hand the custom smelters and metal dealers have been charging premiums ranging between two and seven cents per pound. During October world copper production established a new record, but the high demands of a booming European economy and buying for year-end inventory purposes in this Country have kept copper at historically high prices and in short supply. Rome Cable, I feel, has been well treated by its suppliers. However, the effects of last summer's disastrous copper strikes remain with us, and late deliveries caused

[fol. 5149]

ROME CABLE CORPORATION

COPPER -Cont'd

lower shipments in November than budgeted. Barring strikes throughout the world we expect to receive sufficient copper in December and January to fill most of our customers' requirements. By February or March we hope that supply will balance the demand and the premium price for smelter copper disappear.

ALUMINUM

Although our aluminum needs have been satisfactorily met by ALCOA the present allocations to us for the remainder of the fiscal year provide only for the present level of operations at a time when more of our customers are switching to aluminum in protest against copper's high price and new outlets could be developed. Since ALCOA in October advised us that we should no longer depend on them as our sole source of aluminum pig, we have actively been trying to get on the books of other aluminum suppliers. To date we have had only limited success with Kaiser, but we believe in a few months we can begin to rely on one or two other sources in addition to ALCOA.

STEEL

Steel likewise continues in limited supply, but we have been able to get sufficient supplies to increase our production of thin wall conduit for the next few months. If the steel companies maintain their delivery promises, we should be in a position to meet out customers requirements unless the anticipated steel sheet price increase forces an unusually large demand for conduit.

PAYROLL STATISTICS

Our factory payrolls covering number of employees, weekly payroll, average weekly wage and average hours worked for period a year ago, six months ago and the last week available, as well as number of monthly salaried employees for both Rome and Torrance are shown below:

Week Ending	No. Employees	Total Payroll	Avg. Weekly Wage	Avg. Hrs. Worked	No. Salaried Employees
ROME					
12/5/54	M 841	$ 77,311.85	$ 91.93	43.6	
	F 22	1,407.04	63.96	39.4	411
6/12/55	M 856	$ 76,183.41	$ 89.00	42.7	
	F 37	2,234.36	60.39	37.2	411
12/4/55	M 883	$ 89,775.04	$101.67	46.0	
	F 40	2,825.02	70.62	40.8	419
TORRANCE					
12/4/54	139	$ 12,612.48	$ 90.74	40.0	32
6/25/55	123	11,509.08	93.57	40.6	37
12/2/55	130	12,483.11	96.02	41/1	48*

* Due to transfer of 9 sub-foremen from hourly to monthly salaried payroll.

[fol. 5150]

ROME CABLE CORPORATION

PAYROLL STATISTICS -Cont'd

It is worthy to note that the increase in number of employees at both Rome and Torrance in the last year is considerably less than the increase in output.

LABOR

The CIO Steel Workers Union and the A F of L Machinists Union informed us that they had enough signed cards from employees to warrant an NLRB supervised election at Torrance. This was held on November 3, 1955 and a majority of our employees voted for no Union. Our majority was cut considerably from the previous year and our Torrance Manager has made an excellent analysis of reasons for this changing trend and attitude, and steps are under way by an educational program to rectify the conditions and misunderstandings.

Contract has been signed in Rome covering maintenance employees extending the contract to October 7, 1957, without any changes from our voluntary offer of July 27th. There is a reopening possible on October 7, 1956 regarding rates.

With the recently accomplished merger of A. F. of L. and C.I.O. we can expect increasing and better planned pressure upon both plants for complete unionization. Our personal and employee relations have been well handled in the past. This is a new challenge for the future.

CAPITAL EXPENDITURES

Our capital expenditure program has changed radically during the year due to better business outlook. We entered the new fiscal year with a carry-over of $324,000 unpaid for authorized expenditures from prior years. Our original informal authorization added a total of $545,000 to that figure. This was supplemented in September with another $165,000 for reconstruction of Building 1, and additional extruding equipment at a cost of $125,000 to take care of both increased ALCOA demands for neoprene, plus our own needs for additional plastic capacity. There was also added $185,000 for additional Property equipment. As a result our total authorizations plus carry-overs will total in the neighborhood of $1,350,000 for the year of which carry-overs will approximate $200,000, leaving a net addition of about $1,150,000 for the fiscal year. All but approximately $130,000 of this amount was for Rome expenditures. Our depreciation for the current year will run $655,000 for Rome and $195,000 for Torrance, or a total of $850,000.

Because of the increasing lead time necessary to get new equipment I asked our Operating Department at both plants to submit a preliminary request covering suggested requirements for the next fiscal year. These have not been screened or generally discussed by the Executive Committee at the time of writing this report but the grand total approximates $1,000,000. In the light of other discussions which we will have at this meeting I urge a very careful scrutiny and a partial approval of

[fol. 5151]

ROME CABLE CORPORATION

CAPITAL EXPENDITURES -Con t'd.

the most necessary items, and then having the whole program synchronized with our overall cash requirements for the new year.

For your information capital expenditures approved since the last meeting are listed separately.

ROME PLANT OPERATIONS

I am very pleased with the progress that has been made on plant rearrangement in Rome. About two-thirds of the program is completed and savings already made are running approximately 50% of our overall estimate. Shipping and Receiving Departments, as well as the Magnet Wire Dept., have been relocated. Several insulating sub-departments have been moved to Spiral Four building, the saturating and finishing departments and tool room have been rearranged. There still remain the rearrangement of the C-V. Dept., installation of the new Properzi in the reconstructed building, moving of Spiral Four and certain other sub-sections of the insulating department to complete our rehabiliation program. We commend the Production Dept. for their excellent production record which not only has had to contend with moving equipment but in some cases serious lack of copperv

TORRANCE

Torrance has made notable strides in cost reduction by cutting scrap, increasing percentage of operations on incentive. Their new warehouse will save considerably on outside warehouse rent and duplicate handling of material. By next quarter we should be successfully galvanizing the thread of our rigid pipe and we hope we can have a decision that would elimimte our costly enameling operation.

I am urging factory, engineering and sales for a decision on the protective coating problem for Torrance that might enable us to write off the $60,000 of unsuited equipment at very substantial annual savings for the future. Elimination of this enameling unit would provide sufficient space for one or two plastic extruders, which would enable us to begin manufacture of plastic wire at Torrance.

Industrial tubing business is showing a healthy growth. If either one of the two competitors who are asking us to make EMT for them for their West Coast needs should finally decide to do so this increased load would add very materially to the profits of the Torrance operations. At Glenn Koger's request we are investigating the cost of acquiring the additional 5 acres adjoining our plant which belongs to the City of Torrance.

[fol. 5152]

ROME CABLE CORPORATION

DIVIDENDS

In view of heavy demands on cash I consider it wise to recommend declaration of Dividend No. 67 at the regular rate of 35 cents per share payable on January 4, 1956 to share owners of record on December 23, 1955. If our present projected earnings for the current fiscal year materialize I believe we could well consider a 5 per cent stock dividend at our next Directors' meeting.

I also recommend payment of cash dividend to employees on the same date at 17-1/2 cents per participating unit, and that a contribution of an additional one-third of that amount be added to the Rome Cable Employee Profit-Sharing Trust Fund.

PENSION PLAN

We will have available for the meeting a proposed contract with Massachusetts Mutual Life Insurance Co. to handle all record keeping, acturial computation and disbursements on our Pension Plan on what is known as a split fund basis. If we were planning to amortize past service liability over a thirty year basis payment of $120,000 for the first year would be made to the insurance company and a fixed amount of $195,000 would be made to the bank trustee, J. P. Morgan & Co. For tax purposes we would be allowed a total contribution of $438,000 in the current fiscal year and we are accruing expenses at that rate. If we were able to maintain that rate of payment for eleven years a net saving of over $800,000 would accrue to the Company. Such advances could likewise cushion or reduce heavy payments in a year of poor operations. I strongly recommend our planning on a contribution of $438,000 before March 31, 1956.

There are a number of policy matters regarding the pension contracts with Massachusetts Mutual Life Insurance Co. and J. P. Morgan & Co. Incorporated that will be covered in a separate memorandum and on which I would like to have your decision and action at this meeting. As soon as the contracts have your approval we shall proceed to get Treasury approval on both Pension and Profit-Sharing Plan if humanly possible before the end of our fiscal year.

ROME CABLE EMPLOYEE PROFIT-SHARING TRUST

There are also some policy decisions to be settled before we can execute a contract with J. P. Morgan & Co. Incorporated on our Employee Profit-Sharing Trust and these will also be covered by a memorandum submitted to the meeting. With the payment to be made on January 4th we will have approximately $26,000 in the fund. I would like to have the trust instrument executed so that we can start putting it to work rather than having it lie in the bank without interest.

[fol. 3153]

ROME CABLE CORPORATION

ROME CABLE FOUNDATION

Since 1952 we have contributed $200,000 in cash and 1000 shares of Rome Cable Common Stock to Rome Cable Foundation. As of November 30th we had $26,000 in cash and $126,000 book value of investments (market value $155,000). Our commitments for the balance of the fiscal year will run approximately $16,000, which is about the same amount as we have already disbursed. Because of poorer operations last year we had to cut our contributions. I would like to recommend our paying $75,000 to the Foundation in the current fiscal year, but only paying $35,000 to them at the present time and awaiting final action on the above recommendation until our March meeting. If you see fit some portion of this contribution could be made from treasury stock. Our scholarship program will cost us about $14,000 in the current fiscal year.

EXECUTIVE BONUS

At the last meeting we approved the recommendation of the special bonus committee revising the Executive Bonus. It has been customary in prior years to make one or two distributions before the end of a calendar year and in good years these have ranged from $165,000 to $200,000. We have done this in an effort to make a more equitable distribution of taxes to the recipients. On the basis of the amount that will be accrued in the bonus fund by December 31st I recommend the payment of $150,000 at the Treasurer's discretion to those persons authorized at the last meeting of the Board and in the amounts indicated.

CHRISTMAS GIFT

In accordance with past practice I recommend that $5. Christmas gift be distributed to all employees other than officers who are directors.

GROUP 2 BONUS

For many years we have voted a distribution in December, a payment ranging from 2-1/2 to 7-1/2%, to a group of salaried employees not covered by Executive Bonus or Supervisory Bonus. On the basis of earnings I recommend that a distribution at the rate of 5% be made to those employees qualifying at an estimated cost of approximately $27,000, most of which has already been accrued. I further recommend that the salary committee be authorized to study and revise this plan.

STOCK PURCHASES

At various times during the year the Finance Committee has authorized the purchase of up to 10,000 shares of our stock. To date we have acquired 8,789 shares of this total at an average price of $23. 3/4 per share. There are several uses to which this stock could be put -(1) some could be transferred to Rome Cable Foundation or to the Pension or Profit-Sharing Trust at a saving in cash to the Company.

[fol. 3154]

ROME CABLE CORPORATION

STOCK PURCHASES -Cont'd

While the cost of acquisition mentioned above runs approximately 15 per cent below current market price, which is the maximum difference allowed by the Internal Revenue Department, and a year has elapsed since our last plan we do not believe that another offering should be made at this time because there is still $317,000 owing to the Company by 82 individuals on the other three offerings.

It is also possible that such a block of stock might be of use in some of our other programs that will be discussed at this meeting.

MOVIE FILM

We had a showing of our film "CABLE MAKERS" for several hundred of our Rome employees in November and it was well received. Plans are under way to make this available for TV showing.

We just had a showing today on the film which the conduit industry group produced under NEMA auspices. This is a very effective story both on adequate wiring and the use of conduit. We expect to purchase several copies for effective use by our sales department.

SALES MEETING

We had our annual sales meeting in September attended only by District Managers and a small group of Rome people. It was an excellent meeting. The Sales and Engineering Departments are conducting regional meetings throughout the year with marked success.

AMERICAN SYNTHETIC RUBBER

You will recall that our Board authorized the investment of up to $100,000 to be pooled with several other wire companies and other synthetic rubber users toward the purchase of the Louisville GRS plant from the Government. To date we have paid in $73,000 of our commitment for which we have 430 shares of American Synthetic Rubber Common Stock and $30,000 of 4-1/2% Debentures. We received our first debenture interest check in November in an amount of $ 675. I have also just received the six months' interim statement through October 31, 1955 which shows a very satisfactory earning during that period. Earnings are $691,000 after taxes or approximately $27. per share of the 25,113 shares outstanding. Their Board of Directors is considering a further expansion program. Production currently is at a rate of 20% in excess of rated capacity for the facility.

[fol. 5155]

ROME CABLE CORPORATION

RENEGOTIATION

We have had several meetings with the New York Regional Board handling our renegotiation case. For the fiscal year ended March 31, 1952 they have asked for a gross refund of $150,000, which after tax credit amounts to $24,000. Sufficient amount has been set up in our tax accrual to cover such a payment. We made one final effort, in a letter by Mr. Fraser, which strongly indicated our reluctance to accept their determination. We have received their reply stating they have further reviewed our case and are standing firm on their first determination. The course of action left to us is to either accept their recommendation or take our appeal to Washington. I would like to have some discussion of this at the meeting. My own recommendation at the moment is that we accept with a strong letter emphasizing that the determinaion which we are accepting for that year is being accepted without prejudice that might affect the two following years.

PRICES

Because of metal scarcity and heavy demands for the products of the wire industry prices have been more stable over the past few months than for a long time. Our products are being sold on a price based on 43 cent copper while the average purchase price of the raw metal by companies other than producer controlled is in excess of that owing to higher prices charged by smelters and other small producers. We have absorbed over a quarter of a million dollars loss in the first seven months of this fiscal year due to this condition.

ALCOA AGREEMENT

We had a meeting with representatives of the Aluminum Co. of America early in October. They indicated that they were going to put in their own extruding facilities for the production of plastic covered aluminum wires and that we would probably only be supplying small quantities of this type to them by next October. On neoprene, however, they told us they had no plans for that production. In fact almost immediately after that meeting they asked us to further increase our production for them. By manipulation of shifts we have been able to almost double that production. In November we had an official request to expand our facilities and accordingly after discussion have authorized the purchase of another CV insulating machine and are accordingly writing ALCOA to extend our agreement with them on this product to a total of 7,000,000 feet per month, which is more than three times the average that we supplied in the first eight months of the year. We have asked that the agreement be extended to January 1, 1958, with provisions for extending the agreement should both parties so desire. This should prove a very satisfactory and lucrative load for our plant.

[fol. 5156]

ROME CABLE CORPORATION

THE FUTURE

The majority of the judicies and predictions for the year 1956 talk of output and demand in excess of the current year. Every now and then we see and hear something which could well urge a note of caution. I hope we will have time to get your individual views as a means of determining policies for 1956. Such discussion could well encompass the all important step up in the cold war, our basic raw materials supply situation, our immediate expansion program, and certainly the financial needs which this would involve. We have ceased to be a small company but cannot yet be classed in the realm of being a big company. Such growth as we have had in a span of less than twenty years could not help but leave us with growing pains.

Whatever doubt, if any, there may be regarding the year 1956 certainly the prognostications and prophecies for industrial growth particularly in the electrical manufacturing and utility industries, which we serve, and the chemical industry which serves us are nothing short of fantastic whether it be ten, fifteen or twenty-five years that is being considered. Predictions made ten years ago, which seemed to be in the same category then looking at 1955 could well be as far wrong for 1965 to 1980. We have all thought that the pace has been terrific. We must carefully analyse our ability to further step-up our pace.

We have had many discussions in our various "Whither goest thou?" meetings and it seems to me that now we must become more aggressive and more definite in our approach toward the attainment of our goal. We have all agreed that even the maintenance of our present position in the industry must involve considerable expansion. We have discussed some possibilities of mergers. We have had certain nibbles where larger units in both allied and unrelated industries have shown interest in us. Diversification and bigness are every day subjects of discussion. We have had many discussions as to how best to plan our own destiny for the best mutual interest of share owners and employees alike. I think we have looked at the matter unselfishly.

Our most recent meetings seemed to have centered around rounding out our product line through the possibility of acquiring some smaller companies which could help accomplish this purpose as well as disperse our production facilities on a better basis to meet competition. The present pace in the program that we have been carrying out is more of a strain on our present organization than I like to see. Some things of necessity have had to lag and with the probability of adding to our overall program rather than curtailing it cannot help but add to our prospective difficulties. Any expansion move involving any other company should be well screened as to the matter of organization and what additional burden would be placed on the home organization here. At the next organizational audit meeting to be held in January I want each separate section of our company to review our organizational problems more aggressively and constructively.

[fol. 5157]

ROME CABLE CORPORATION

THE FUTURE - Cont'd

We must carefully search our present younger organization for men who are able to take on larger responsibility and present top executives will have to delegate more responsibility to these men in order to have them available for some of the problems that we face in the future. If my guess as to the program that will be suggested or adopted by this Board today is anywhere near correct. I feel we have done a fine job overall to date in share owner and employee relations and I am proud of our reputation with our suppliers, customers, financial institutions and in the communities where we have plants. We stand very well with our competitors too. While we have done an amazing job of keeping up-to-date considering the size of our organization I believe the stepped up pace of the future is going to require more serious planned efforts to even maintain our present position.

We must consider expansion of our product line, the new uses of aluminum conductors for building wires, service cable, power cables, welding cables, etc., as well as the possibility of broadening our present limited line of ACSR. Trends in rectangular magnet wire indicate rapid growth in demand for rectangular enameled magnet wire. This growth is going on at the expense of the type of product which we produce. It therefore seems vital that we should soon have facilities for production of rectangular enameled magnet wire and a broad line of enamel wire of other types we believe would also be helpful to us.

We have watched the terrific growth in telephone wire demand. Part of our present program of expansion provides some facilities for this.

We still lack the heavy sizes of rigid at Torrance and could well consider some discussion regarding expansion of our industrial tube operations, aluminum tubing and even plastic tubing. Mention was made earlier of potential manufacturing space available for plastic wires at Torrance. There are other locations that should be studied.

Mr. Fraser will bring you up-to-date at the meeting on the interest of some other companies in us and our interest in them, and we should have a discussion as to how this will fit our overall program.

Adoption of any part of this program is going to mean a need for more money and the expenditure of a great deal of energy by the Rome organization. Wherever competent outside services can be hired to do some of this work I am in favor of doing so. I believe it is vital that we as soon as possible determine what our needs are for a good sized student course for the coming year. The competition for the graduates is exceedingly keen and we will probably have to revise upward our ideas of remuneration, with all of its affects on our present organization. There are a number of departments in our organization which need near-term strengthening and if we cannot do it from our upgrading of our own organization we should be initiating steps to find them elsewhere.

[fol. 5158]
ROME CABLE CORPORATION

THE FUTURE - Cont'd.

This whole program is going to be adding to our expenses but I feel that the Board could well consider a sum expended in this fashion as insurance for the future.

I know this whole program is a large order for one day but I hope when the day ends we can consider that some progress has been made.

NEW DIRECTOR

I know I speak for all the members of the Board in extending a very sincere welcome to our new director, "Al" Foote. Each of us know how helpful he has been to us in the past and we are pleased with the opportunity of working more closely with him.

Respectfully submitted,

H. T. DYETT,
Chairman of the Board

Aluminum.

This week the Syracuse office of Kaiser told us they had 90,000 lbs. for us in the second quarter, 30,000 lbs. each month. This is the first time we have been able to buy any aluminum pig from any source except Alcoa. Kaiser indicated that this was a start on a month to month basis since they did not wish to be in-and-outers.

Last week Andy Hunter and Kurt Gager of Aluminum, salesmen in the eastern section, spent nearly a whole day with us. They were not particularly optimistic as to getting into their month to month schedule but did say that once in a while they had wind-falls. I indicated we would be very happy to have one of these with the understanding that it would not be the basis for a month to month contract.

From the above you can see that we are beginning to make a start.

Aluminum.

Within the past week we have had conversations with both Kaiser and Alcoa on the subject of our selling redraw rod. Both these companies received the information that we had been selling to Aerofin Corporation. Messrs. Stout and Ralph Davies of Alcoa and Messrs. Belknap, Berry, Southerland and Tietjen have been advised that this was

only a sample order in the amount of approximately 1,000 lbs. The Kaiser men and Bill Stout were told by both Glenn Rolston and me that we were not currently selling redraw rod, that we were in no position to offer these rods owing to the tight aluminum situation, but we emphasized that we felt this was a normal type business for us in times when metal was not as scarce as it is today.

The Kaiser men left a long-term contract with us to run for a period of 10 years starting January 1957. This contract calls for 600,000 lbs. per year, which we emphasized was a drop in the bucket. They indicated that this would not mean they would not offer us more but that it is merely a part of the amount which the government wishes Kaiser to sell to independent fabricators during this period. We should have Executive Committee consideration of this contract next week.

In talking with Ralph Davies he stated that he would not be surprised to see the aluminum pig situation loosen up within two weeks or so. At present secondary aluminum is quite free and certain customers are turning to this market who had formerly stated they needed primary aluminum. As yet he did not know of any pig availability but intimated that this situation could change very fast. I emphasized that with the cut from 400,000 lbs. to 350,000 lbs. he caused us considerable hardship and that the most that we had been able to get from other sources was 30,000 lbs. a month. He promised that if and when more pig became available that they would consider additional amounts for us. He thought that Aluminum shipments might be increased into this country within the near future. Incidentally, he did not seem to take the Aerofin situation as seriously as Alcoa sales offices.

Gib Wolfe was advised this morning that we could not make any offer to sell Aerofin rods until the overall pig situation had improved.

Alcoa.

On June 13th Bill Stout visited us, and I told him in Stan's presence that in July we were receiving aluminum from a third source and that we now were in the position where we could offer rods. He implied that they would have no objection to this policy, which confirms my conversation of early last month with Ralph Davies.

In respect to next quarter's aluminum from Alcoa, Bill stated that they would not reduce below the 300,000 lbs. a month and that they might possibly have additional tonnage for us. This statement was made after I told him that in line with our conversation last October we were now in a position to give them some relief in July to the extent of 60,000 lbs. if Alcoa actually wished to reduce July shipments to us. I made it very clear that we would be unhappy if they requested it, but we would agree to it since this was our verbal arrangement with Ralph Davies. I asked that he pass this information on to Pittsburgh.

Bill says that Alcoa is now thinking about long term contracts. It is his belief that these would run for a period of five years. I told him of our dislike of contracts which ran for more than one or two years unless there was a fair escape clause. He had been told two months ago that Alcoa would give us additional tonnage if we were going to enter into definite arrangements with other suppliers even if such arrangements did not start until early 1957. He did not know whether or not Alcoa would now favor us making long term contracts with others as the metal is now more plentiful. It seems rather unusual that a supplier would wish us to make contracts and then give us additional tonnages until these contracts became effective at a time when aluminum was scarce. However, I am only reporting what Bill told me.

Rome Cable Corporation

1956 Sales Conference

Products—G. E. Rolston.

In our program this year we have tried to bring you men more and more into the discussions as you will see later. There is not as much in our part of the program on the products as such. We are not always sure that complete understanding is retained by you people when you go back. Most of the information on the product as such will be forthcoming as Bob said yesterday in the form of bulletins and we are going to try to send out supplementary information of a typical sales character that may supplement information that you get from the Engineering Department. There are, however, a few problems that we are faced with that involve products, the first one of which is aluminum.

You have heard Jack's story about availability. You saw some things in the plant and laboratory and while it is perfectly true that we generally are in a position to produce aluminum conductors with, we will say literally, any of the types of coverings that we now make for copper, they present no problem. Unfortunately, the commercial situation is not at all clear. At the moment, ACSR as a typical example where we have limited our activities in the past, we will expand. With the availability of more aluminum, we are making studies of this freight rate situation, but I believe while I cannot answer it at this time, that we can meet it. In all areas we will definitely expand the areas of ACSR which we have restricted heretofore. One part of our program has been to improve the operations of the Properzi equipment. We have better costs of producing rod than we had some time ago and here again, it is somewhat like a steel mill. If we are going to get those costs down, we are going to have to put more tonnage through those Properzi machines so that factor of quantity is an important one now.

There is no change in general in the picture insofar as covered line wire, whether it be Polyethylene or Neoprene or in Triplex. The commercial picture has been pretty well established for a long time, but when we get over into the area of building wire, RH-RW type or TW to name just the two in that field, we have a situation whereby one of the integrated aluminum manufacturers is exceedingly anxious to introduce aluminum in place of copper. It is our belief that in so doing they are overlooking certain fundamentals and elements of manufacturing costs and profit consideration, and we feel quite frankly that their published price schedules are entirely unrealistic in relation to costs, so much so that in some cases we can't even consider the possibility of having any price levels that would be competitive with that integrated producer. This situation is not peculiar to us. It is chiefly the problem of any other insulated wire manufacturer who is equally anxious as we are to put on a covering over literally any conductor. How soon this situation might be recognized I don't know, but let us go back for a moment to just about four or five years ago. As you know, the introduction of covered aluminum wire and Triplex only dates back in any quantity to the middle of 1951. The same integrated producer was definitely interested in promoting the use of covered aluminum conductors for overhead distribution work and he had published price lists that were approximately 20 to 25% under price lists that we and other insulated wire manufacturers had.

[fol. 5163] We wrote out the criticisms at that time. You fellows traced it and said you couldn't understand why our price was $120 when they could buy it from an integrated producer for $100. We believed then as we believe now that part of the problem in their mind was to overcome the resistance and the inertia on the part of utilities and others to change from a copper conductor to aluminum conductor. As time went on the thing became corrected and you now have an industry price level that is relatively uniform in those products. It is my belief and the belief of some others that the same action is being taken now in that it is recognized that the ordinary contractor has certain reluctance in dealing with aluminum conductor so they established a price level which creates enough incentive on the

saving basis to interest them to get into this product line. Now I believe the same thing would happen as heretofore that when such progress has been made and overcome in this inertia and resistance then the price might seek levels at which we think they should be in relation to costs at the present time. The answer to all that is that we are in a practically impossible position to say to you that we are introducing a line of type SE cable, TW building wire, RH-RW, RR cable, RRD, with aluminum conductors. I will say that in the study of this thing, when, as and if we do unless there is some change, they will not be anywhere near the price level that is now public information from this integrated producer. I am telling you in advance that if we do take such action please don't object to the high prices that we will have because that is the situation that is going on at the present time.

I can best give you an illustration of what we believe to be this type of thinking. It is what happened when we were told first hand from this integrated producer that there was three school buildings built out in Iowa in which they had an opportunity to work with the engineers and then subsequently the contractor in the detail layout of these jobs. The intent was very definite that they get aluminum building wire in these three schools. The figures were something like this: that in the original layout that the copper wire, priced as it was at that time, would cost approximately $75,000. If you used aluminum wire, we will say priced on what I call a conductor substitution that is where you simply take out the copper conductor and put in aluminum and have the same price for the covering would have resulted in about $62,000, but this particular integrated producer having an interest in getting it across agreed to furnish the wire for $47,000. Now my reaction to that whole thing was this, wasn't the difference between $62,000 and $75,000 sufficient interest to cause them to select aluminum in place of copper? Why did it have to be another $15,000 below what I would call realistic figures? Well, you can draw your own conclusions just how much you have to offer to someone to get them to overcome years of experience and practice, I don't know but that gives you the relative level.

There are one or two manufacturers who apparently have

decided that they will or have entered into what we will call it, insulated aluminum field. I am talking in building wire or 600 V rubber Neoprene. Their published price schedules as of this time are in the neighborhood of 15 to 20% above the published price schedules of this integrated [fol. 5164] producer. In other words, they have apparently decided that in their case, they too could not recognize this competition so they have brought out published price schedules at this higher level. U.S. Rubber is one, Anaconda Wire & Cable is another and General Cable Corporation is another. Just recently, in fact June the 20th, a new published price schedule of U.S. Rubber was issued on 600 V rubber Neoprene and TW aluminum conductor. That is the situation, so the only way I can see to approach it is to study these individual cases and come up with a decision as to whether or not we think we should go into this field at that level. Don't forget, we cannot afford to sell any of it if we make 500 ft. quantities here and there. It means a decision to manufacture and stock aluminum conductors of this type because you surely can't be in the building wire business 600 V RRD making every order special. We have made quite a considerable quantity of aluminum conductor with rubber Neoprene coverings, those of you who have not run into it as a matter of fact, we produced this cable for use in the Aluminum Company of America plants. We stock in Rome. In fact that stock is available to you. We carry a stock of RRD cable in assorted sizes. It is rather interesting to note that the prices at which we are selling this RRD cable, aluminum conductor, I assure you are not at the price level of this integrated producer,—we cannot meet it. We have been asked if we won't sell aluminum rod. We have already submitted some samples to two different accounts,—so it may well be that very shortly we will be selling 3/8" aluminum rod. We will also be interested in furnishing aluminum drawn wire similar to the fabricator customers we have now where we furnish copper. We will work on and expand that activity, but on new types of insulated construction materials in that whole field, we are going to have to go very very slowly.

In connection with the engineering department's program yesterday, they showed you that this problem of making what we call compact type of strand is not a difficult

one. They successfully made it and have a bulletin that will show the range of sizes that can be furnished, but here again, we have got the old commercial problem. If we are going to get anywhere, we just can't have two or three different wires for the same purpose. In other words, it is an awful job now, we've got many different constructions of Triplex and everybody wants a different type of neutral and when you combine Polyethylene with Neoprene and two shot compared to one shot and 500 ft. coils instead of 1,000 ft. reels, we are confronted with many problems.

Now it is my belief that we should not go hog wild on this type, what we will call compact strand. My own experience from the few places I have been in the field is nix. Jim Scheppach and I made calls, 20 minutes apart, in Indiana. One place said they have tried it and like it and they thought maybe that is what they would use. The other one said they had some and they never wanted to hear about it again. I don't know the specific reasons. Just within the last week, there is a report from Dick Gray's territory that Penn Electric bought 30,000 ft. of a Triplex cable with the neutral. They had all kinds of trouble with the particular type of fittings they use. Now that doesn't necessarily mean that this product is not good. There are these [fol. 5165] advantages that were given to you yesterday, but the point I am talking about is put yourself in our place. We certainly can't be talking about one day furnish this type of strand, and another day the other and get any service on it. We will probably have to set up absolute minimums and we may have to say we won't furnish it in less than 50,000 ft. quantities because here again we cannot afford to set up for small quantities. I have had some conversations with the company that has promoted this, Southern Electrical Corporation who started this compact strand and which they call Compresto. I believe the acceptance has been mixed. I am told that it has been well accepted in Texas and Oklahoma and through there. I am also told that in other areas they just don't want any part of it, so I think you have got to steer a pretty careful course in connection with that.

The next thing which Rudy touched on and said that I would mention is our changed equipment with regard to cabling of conductors and the fields which we might enter

both more profitably and in greater quantity than we have in the past. This new cabling machine will certainly give us greatly improved operations and greatly increased capacity on control cables. We are going to have considerably better operations of cabling of conductors. We will be able to go up to 37 conductors of one pass,—in other words as one pass through the machine you can cable up to 37 conductors. Actually by going through several times it brings our normal limit up to I think we can make 91 conductors of the straight away type going through this cable by the several passes which we couldn't do at all. Of course, we can make cables literally with hundreds of conductors depending on the groupings of pairs, triplets, quads, etc. With regard to the specific telephone type which we will call the exchange cable which is tied with the RTA and REA, we have checked the published price schedules of five or six of the people who are principally involved in that business and quite frankly we cannot see that we are going to be able to be competitive with G.C.C., Anaconda, Whitney Blake or Ansonia. Now, as Rudy mentioned, that still does not close the door to those types of cables of which there are many many variations. For instance as a typical example, there is the cable that is mentioned from Duquesne Light. There is a third type of cable, I believe it is going into a new Atomic Energy Plant. Now fundamentally it is this type of cable, but it isn't sold on the basis of the exchange cable price lists, so I just want you to know that when it comes to strictly these REA or RTA exchange cables we will not be competitive.

As Bob Graham told you yesterday, we have now a few new types of polyethylene. Let's make sure we know what we mean when we talk about high density or high molecular weight polyethylene. These terms can be confusing, so acquaint yourself with these new types so we will all know what you really want.

[fol. 5166] IN UNITED STATES DISTRICT COURT

ROME CABLE
CORPORATION

ROME, N.Y.

REPORT SUBMITTED TO THE BOARD OF DIRECTORS OF ROME CABLE CORPORATION AT THEIR MEETING NOVEMBER 29, 1956

I present record of sales and earnings after taxes by fiscal years from 1937 to date, and by quarters for the current year, the month of October and estimates for November:

Fiscal Year Ended	Net Sales		Earnings
March 31, 1937	$ 1,798,042		1,616
March 31, 1938	4,957,103		71,027
March 31, 1939	5,370,665		245,036
March 31, 1940	6,080,902		297,736
March 31, 1941	9,465,451		431,501
March 31, 1942	11,631,785		592,135
March 31, 1943	12,712,333		367,654
March 31, 1944	16,909,735		466,709
March 31, 1945	22,798,218		486,653
March 31, 1946	16,975,009		398,973
March 31, 1947	18,436,305		1,359,593
March 31, 1948	25,202,853		1,152,579
March 31, 1949	26,088,523		1,115,960
March 31, 1950	19,602,984		302,209)
		Plus: Transfer from contingency reserve	150,000)
			452,209
March 31, 1951	35,142,901	Net	
		Minus: $1,922,136	
		Transfer to copper reserve 150,000	1,772,136
March 31, 1952	42,657,848		1,753,651
March 31, 1953	54,632,976		2,008,321
March 31, 1954	44,114,825		1,637,787
March 31, 1955	39,186,095		930,879
March 31, 1956	56,996,682		2,023,070
April-June Quarter	14,752,299		540,156
July - Sept. Quarter	13,172,110		641,090
Total Six Months	27,924,409		1,181,246
October 1956	4,505,518		196,214
Total Seven Months	32,429,927		1,377,460
November(Estimated)	4,255,000		185,000
December (Estimated)	4,400,000		180,000
Total Third Quarter(Est.)	13,160,518		561,214
Total Nine Months(Est.)	$ 41,084,927		$ 1,742,460

[Fol. 5167]

ROME CABLE CORPORATION

Sales for the current quarter should run approximately the same as for the last quarter but earnings may be off as much as 15 per cent, or about $80,000. Sales will run more than 10 per cent behind the same period a year ago.

SALES AND ORDERS

The breakdown of sales before deduction for discount and freight from April to November, with November 1956 figures estimated, are as follows:

	April - November* 1956	April-November 1955	% Increase or (Decrease)
Rods	$ 3,917,000	$ 4,270,046	(8.3)
Bare	5,965,000	6,182,107	(3.5)
Weatherproof	1,772,000	2,294,556	(27.7)
Magnet	2,572,000	2,486,256	3.4
Rubber Covered	15,834,000	14,011,423	13.0
Torrance-E.M.T.	2,356,000	1,999,051	17.9
Rigid	2,489,000	1,801,906	38.1
Spiral 4	-	1,229,700	-
Aluminum	3,635,000	2,695,544	34.9
	$ 38,540,000	$ 36,970,589	4.2

* November 1956 estimated.

On the basis of present indications our dollar value of sales for the current fiscal year will run about 3 per cent behind a year ago.

During the first seven months of our fiscal year quantity of incoming orders for copper products declined 10 per cent below the period of a year ago, while Aluminum and Torrance increased approximately 30 per cent. On the basis of dollar value the total was about in balance for the two periods.

BACKLOG OF ORDERS

January 6, 1956	Rome - Copper Products	$ 5,162,000
	Aluminum	907,000
	Spiral 4	463,000
	Torrance - E.M.T.	271,000
	Rigid	479,000
		$ 7,282,000
June 30, 1956	Rome - Copper Products	$ 4,153,000
	Aluminum	894,000
	Spiral 4	-
	Torrance - E.M.T.	189,000
	Rigid	76,000
		$ 5,312,000

[fol. 5168]

ROME CABLE CORPORATION

BACKLOG OF ORDERS - Cont'd

Nov. 1, 1956	Rome - Copper Products	$ 3,122,000
	Aluminum	1,017,000
	Spiral 4	-
	Torrance - E.M.T.	47,000
	Rigid	206,000
		$ 4,392,000

You will note from the three above periods the steady decline in backlog in Rome Copper Products and increase in aluminum backlog. There is little question but the weakness in the price of copper and greater availability that has developed during the year, which has influenced our customers to liquidate inventories, has materially affected our backlog.

COPPER

Since the September 5th meeting the producers have reduced the price of copper from 40 cents to 36 cents per pound. Although improving demand continues less than copper production, we believe there will be a determined effort to maintain the 36 cent level unless foreign consumption is adversely affected by oil rationing. At the start of 1956 the custom smelters were charging seven cents a pound premium over the producer figure of 43 cents. In November for the first time in many months there has been one quotation for domestic copper. With an ample supply of metal available we feel it expedient to keep our copper purchasing at a minimum.

ALUMINUM

As with copper we are being offered more aluminum than we require. We now have three sources supplying us each quarter with a fourth, Reynolds Metals, showing the first definite interest in shipping on a monthly schedule. Even though the aluminum companies foresee a tightening supply next summer, we believe our stocks should be ample for presently projected needs.

STEEL

Keeping a balanced inventory of sheet steel has confronted us with a serious problem. Cold rolled steel, required for E.M.T. has been plentiful, but the scarcity of hot rolled sheets for Rigid has resulted in an unbalanced inventory at the present. With the longshoremen back at work we expect, however, to have sufficient hot rolled steel next quarter.

[fol. 5169]

ROME CABLE CORPORATION

PAYROLL STATISTICS

	Week Ending	No. Employees	Total Payroll	Avg. Wkly. Wage	Avg. Hrs. Pr/Wk.	No. Salaried Employees
ROME	12/11/55	M 882 F 38 920	$ 93,823.58	$ 101.98	46.1	418
	6/17/56	M 903 F 23 927	87,996.85	94.93	43.8	440
	11/18/56	M 880 F 29 909	91,962.83	101.17	45.2	450
TORRANCE	12/10/55	134	$ 13,603.50	$ 101.08	41.8	48
	7/21/56	141	12,953.25	96.50	39.7	47
	11/10/56	140	13,930.66	100.70	41.1	47

You will note from a year ago the number of hourly workers has declined but the number of salaried employees has increased by 8 per cent. Some of this can be accounted for in new students and expanded departments, in line with my recommendations of last year. However, I feel that some study should be made towards bettering the relationship of hourly to salaried workers.

LABOR

Labor relations at Rome are excellent. On November 8th the Torrance plant voted to have the United Steel Workers as their bargaining agent by a vote of 80 to 50. This was a distinct surprise and perhaps we were too complacent and over confident about the results. Negotiations for the first contract will probably not be completed for two months or more. I am told that notwithstanding the election Torrance reports good labor effectiveness.

INVENTORIES

Our inventories are at the highest level we ever had and are 55 per cent higher than a year ago. We have had Ernst & Ernst studying our consigned and warehouse inventory control and are embarking on a program which should reduce our inventories by at least a million dollars before the end of our fiscal year, which monies can be used to good advantage in the paying off of our short term loans of $1,000,000.

[fol. 5170]

ROME CABLE CORPORATION

DIVIDENDS

I recommend payment of dividend No. 71 at the rate of 35 cents per share to share owners of record December 14, payable January 4, 1957. I also recommend payment of cash dividend to employees on the same date at 17-1/2 cents per participating unit, and that a contribution of an additional one-third of that amount be added to the Rome Cable Employee Profit-Sharing Trust Fund.

At our September meeting we discussed the possibility of declaring a 5 per cent stock dividend on the basis of current and expected earnings. I recommend the declaration of a 5 per cent stock dividend to share owners of record December 14 and that distribution be made on January 4, 1957.

EXECUTIVE BONUS

It has been customary at this meeting of the Board to make a first or second payment for the current year on the Executive Bonus. Inasmuch as there has been no payment made to date I recommend approval of disbursement of $175,000 to those members, and in the percentages authorized, at the June Board meeting.

CHRISTMAS GIFT

I recommend that $5.00 be given at Christmas, as usual, to all employees excluding Directors.

PENSION PLAN

We have sixty-two former employees receiving pension or disability benefits under our Retirement Income Plan. In our first year we paid $121,000 to the Insurance Company and $326,000 to J. P. Morgan & Co. Incorporated, Supplementary Trustee. On July 26th we advanced $100,000 to Massachusetts Mutual for current payments. Our insurance advisor suggests that a minimim of $147,000 be paid to the Insurance Company to take care of estimated withdrawals in the ten year period. With the current low yield of securities and the fact that our Supplementary Trusteed Fund as of November 21st shows an appreciation of 2 per cent we might want to have some discussion towards placing a more sizable amount with the Insurance Company in the current year, inasmuch as their interest rate equals that of the Trusteed Fund. This would, of course, enable us at some time in the future to reduce our payments to the Insurance Fund and contra-wise increase our payments to the Supplementary Trusteed Fund, if conditions were more favorable so to do. I would like to have some discussion on this subject at the meeting.

[fol. 5171]

ROME CABLE CORPORATION

PROFIT-SHARING FUND

The Profit Sharing Plan recently received Treasury Department approval. The Market value on November 21, 1956 was $78,160 compared to book value of $71,708. The yield at book value on the investment is 3.95 per cent.

ROME CABLE FOUNDATION

At this meeting it has been customary to take a preliminary look at the amount to be contributed to Rome Cable Foundation. We actually donated $[illegible]582 last year. I recommend that consideration be given for between $75,000 and $100,000 for the current year. As a means of saving cash I would recommend that 1000 shares of Treasury stock be authorized for transfer at this meeting and an additional cash contribution of $16,000 be made as the initial one for the current year. We can then look at the situation at our March meeting on what to do about the balance.

RESEARCH & DEVELOPMENT

At the last two meetings of the Board we had considerable discussion regarding the need for addition to the office and the building of a new laboratory. Capital authorizations were made with request for further investigation but both projects were held up.

We have had many discussions and urge reconsideration of the laboratory program. Mr. Schatzel for some time has been recommending the strengthening of the organization of our laboratory to better serve our needs. At the moment research is the smallest portion of our research, engineering and development budget. Principle duty has been plant and customer engineering service. We have reached a point in size and progress where additional expenditures for organization, equipment and facilities are necessary if we are going to keep abreast of the potential growth of our industry in the years ahead. Meeting the challenge of the atomic and electronic age, plus the many new materials coming from the chemical industry, as well as stepping up our true research on many that we now have further emphasizes the need for this step. Ross Fraser's trip to many wire companies in Europe where their facilities and expenditures for research in many instances dwarf ours indicate that dollars invested at this time in the expansion of our research program at Rome Cable will be one of the best items of insurance for our future.

As a personal note. Our present Director of Research and Engineering indicates he will reach retirement age in about four years and it is not his intention to serve in his present capacity beyond a year longer than that. It therefore seems imperative to me that we give him the facilities and the budget to realize the full benefit of his recommendations within the five year period. I estimate that the building and land will cost approximately $350,000. At this meeting, however, we are merely looking at the approval of the idea of going ahead. The actual details of the programwill be prepared in greater detail by Mr. Schatzel and also by our Plant Engineering staff.

I believe that a new laboratory will require probably an additional $100,000 worth of new equipment and that we might be looking at an increased expenditure for research of about $200,000 per year at the end of five years. This would still keep

[fol. 5172]

ROME CABLE CORPORATION

RESEARCH & DEVELOPMENT - Cont'd.

our percentage for research considerably below the electrical industry.

CAPITAL EXPENDITURES

Our total cash outlay for capital expenditures in the current fiscal year will approximate our total depreciation, or a total of about $850,000. We will have a carryover into the new fiscal year of appropriations totalling about $250,000.

The Executive Committee has had several meetings reviewing potential authorizations for the fiscal year 1957. At this time in addition to the carry-over and the potential $350,000 for laboratory I believe that we should informally authorize another $500,000, the use for which can be supported by Mr. Ellis for discussion at the meeting. The original tentative list prepared by the Manufacturing Department, which includes a complete enameling plant exceeded four million dollars.

In the last quarter we have carefully studied the needs for enameling and believe that for the present an additional expenditure of $65,000 will provide us adequate capacity on flats and squares and round sizes up to approximately size 20. We also decided not to provide additional equipment for production of ACSR at the Rome location.

PUBLIC RELATIONS

For some time we have been anxious to improve or organize our public relations along better lines. Our Advertising Agency - Charles L. Rumrill & Co. Incorporated have recently added a Public Relations Department and in conjunction with our Advertising Department they have outlined a program for better product, corporate, local, regional and national publicity at a fee of $9,000 per year, plus expenses estimated to run from $2,000 to $5,000. We have listened to the outline of the program and heartily recommend its adoption.

TEN YEAR DINNER

Our eleventh ten year dinner was held in the cafeteria Tuesday night, November 27th, with seventy-two new ten year members being added this year. We now have nearly half of our employees having ten years or more service, for which we are very proud.

STUDENT REGRUITING

In June we added Milo Eames to our staff to assist Mr. Schatzel in handling our Student Course, Scholarship program, recruiting of students and overall direction of educational activities in the Company. He is currently visiting the colleges with a well planned program to interest them in Rome Cable. Last year we were unable to get any engineers at all. Our program for the current year calls for three electrical engineers, two mechanical engineers and one chemical engineer. We will likewise not be passing up any opportunities for good prospects who are not engineers.

[fol. 5173]

ROME CABLE CORPORATION

NEW YORK STOCK EXCHANGE

Our number of stockholders is increasing and we should in the near future reexamine the possibility of listing on the New York Stock Exchange.

REVIEW OF CURRENT YEAR'S PROGRAM AND THE FUTURE

At the meeting a year ago I outlined a series of problems and urged the adoption of an aggressive and more definite approach toward the attainment of our goals. In the current calendar year we have accomplished a great deal along certain lines but there remains still many unsettled problems. Organization-wise we have strengthened the Finance Department and look for that department to take over certain responsibilities presently covered by the Comptroller's Department in the matter of salary administration, pension, insurance, etc. Our Sales reorganization is working smoothly and we have strengthened our Advertising Department, and we have increased the responsibility of many of our younger people in the organization, buf there is still much to do in this connection.

On the list of new product additions mentioned a year ago the only definite addition is plans for rectangular and heavy round enamel magnet wire, which will be available some time in mid 1957. We have seen the encouraging results attained when Torrance has an adequate load and the importance of supplementing or augmenting its product line should prove profitable, unless the recent decision to unionize should make the climate or cost unreasonable. We all still appreciate the wisdom of greater diversification of product.

For years we have seen the addition of many new materials for insulation in the development of new products, which in itself has expanded our line, but has also made many uneconomical and unprofitable runs to keep so many items in the line. A realistic appraisal on the basis of market and profitability could well pay big dividends at what we believe slight sacrifice in volume and provide better service to customers.

With the almost fantastic predictions of growth for the electrical industry in the next ten to twenty years we must take more definite steps towards examining and appraising the possibilities of other locations. Our several efforts to acquire or merge with certain other companies, on the basis of expanding our product line and improving our distribution points, have so far met with no success. We continue to have approaches made by larger companies and have listened to their story but our executives still feel that the control of our own destiny will be a happier course. I likewise feel that by taking full advantage of the combined knowledge and reputation of our organization that the financial returns from such a course will prove its merit.

Ross Fraser spent some time in Europe visiting various wire companies in England, Germany, Switzerland, France and Italy. He came back much impressed with the progress of many of these companies in the field of new products, improved equipment design, manufacturing techniques and advanced research. He advises that we have an open door with some of the very progressive companies for a liaison and interchange of technical research information. He feels it is imperative that in planning any equipment program on keeping us up-to-date that some of the European developments should be

[fol. 3174]
ROME CABLE CORPORATION

REVIEW OF CURRENT YEAR'S PROGRAM AND THE FUTURE - Cont'd.

checked by our people on the scene. He also urges near-term visits by research and engineering.

Respectfully submitted,

H. T. Dyett, Chairman of the Board

ROME CABLE
CORPORATION
ROME, N.Y.

REPORT SUBMITTED TO THE BOARD OF DIRECTORS OF ROME CABLE CORPORATION AT THEIR MEETING MARCH 7, 1957

I present record of sales and earnings after taxes by fiscal years from 1937 to date, and by quarters for the current year, the month of January and estimates for February and March:

Fiscal Year Ended	Net Sales			Earnings
March 31, 1937	$ 1,798,092			$ 1,616
March 31, 1938	4,957,103			71,027
March 31, 1939	5,370,665			245,036
March 31, 1940	6,080,902			297,736
March 31, 1941	9,465,451			431,501
March 31, 1942	11,631,785			592,135
March 31, 1943	12,712,333			367,654
March 31, 1944	16,909,735			466,709
March 31, 1945	22,798,218			486,653
March 31, 1946	16,975,009			398,973
March 31, 1947	18,436,305			1,359,593
March 31, 1948	25,202,853			1,152,579
March 31, 1949	26,088,523			1,115,960
March 31, 1950	19,602,984			302,209)
		Plus: Transfer from contingency reserve		150,000)
				452,209
March 31, 1951	35,142,901	Net		
		Minus: Transfer to copper reserve	$ 1,922,136 150,000	1,772,136
March 31, 1952	42,657,848			1,753,651
March 31, 1953	54,632,976			2,008,321
March 31, 1954	44,114,825			1,637,787
March 31, 1955	39,186,095			930,879
March 31, 1956	56,996,682			2,023,070
April - June Quarter	14,752,299			540,156
July-Sept. Quarter	13,172,110			641,090
Oct.-Dec. Quarter	12,724,365			535,399
Total Nine Months	40,648,774			1,716,645
January 1957	4,298,930			163,376
February (Est.)	3,186,000			54,000
March (Est.)	3,849,000			152,000
Tot. Fiscal Yr. (Est)	$ 51,982,704			$ 2,086,021

[fol. 5178]

ROME CABLE CORPORATION

Sales for the current quarter will run 10% lower than the period October to December and 29% lower than the same quarter a year ago. The reduction in overall quantity would be about five points less in each case, the difference being caused by sizable copper price reductions from the two earlier periods. Profits for the fiscal quarter are estimated at $369,000, of which approximately $100,000 will come from Torrance. Estimated profits for the fiscal quarter have been most difficult to estimate because of continuing drop in copper price, which has created a gross loss of $187,000 if copper stays at 32 cents plus inventory gross loss of about $110,000 from the prior year. This represents an over-statement of about $50,000 net in prior year's profits. While the total estimated profits of $2,086,000 will exceed the prior year the per share earnings will be down from $3.82 to $3.74, owing to larger number of shares outstanding in current period, owing to stock dividend. Extraordinary and we hope non-recurring charges approximated $500,000 charged against current fiscal year.

SALES AND ORDERS

The breakdown of sales before deduction for discount and freight from April to February, with February estimated, are as follows:

	April 1956 Feb. 1957	April 1955 Feb. 1956	% Increase or (Decrease)
Rods	$ 5,486,000	$ 7,019,000	(21.8)
Bare	7,545,000	9,395,000	(19.7)
Weatherproof	2,332,000	2,982,000	(21.8)
Magnet	3,454,000	3,652,000	(5.4)
Rubber Covered	20,797,000	19,832,000	4.9
Torrance - E.M.T.	2,950,000	2,658,000	11.0
Rigid	3,352,000	2,283,000	46.8
Spiral 4	--	1,691,000	-
Aluminum	5,061,000	4,147,000	22.0
	$ 50,977,000	$ 53,659,000	(5.0)

Sales estimate for the current fiscal year will be off about 8% from the prior year, although we actually had about equal quantity with the prior year in Rome, and Torrance quantity was 21% ahead of a year ago.

Incoming orders for the eleven months of the fiscal year on a quantity basis are off 5% from the same period a year ago, and the first two calendar months are off 20% from the same two months a year ago.

[fol. 5179]

ROME CABLE CORPORATION

BACKLOG OF ORDERS		Value
February 8, 1957	Rome - Copper Products	$ 2,897,000
	Aluminum	513,000
	Torrance- E. M. T.	48,000
	Rigid	177,000
		$ 3,635,000
August 31, 1956	Rome - Copper Products	$ 3,654,000
	Aluminum	1,083,000
	Torrance- E. M. T. & TV Mast.	365,000
	Rigid	474,000
		$ 5,576,000
February 10, 1956	Rome - Copper Products	$ 5,304,400
	Aluminum	815,000
	Torrance -E. M. T. & TV Mast	428,000
	Rigid	766,000
		$ 7,313,400

Our backlog shows a drastic decline from the two prior periods shown above. Aluminum decline comes from ALCOA now making most of their own plastic. Other Rome product declines are due to lower prices and hand-to-mouth buying in a lower copper market.

COPPER

Producers price for copper has been reduced another 4 cents per pound since the last meeting and smelters and world price is between 1 and 2 cents per pound lower than that. The January statistics were up appreciably from December but sentiment seems to indicate that most people are looking for a 30 cents per pound price. At 32 cents per pound this means a reduction of 23 cents per pound from the world price prevailing at the end of our last fiscal year, which in actual cents per pound is the largest in modern times.

ALUMINUM

Aluminum is in plentiful supply and all the major producers are now anxious to sell us. While our budget for the new fiscal year shows an appreciable increase over fiscal year 1956 our monthly intake will be reduced from the recent levels when we were trying to get a more satisfactory inventory on hand.

STEEL

We have been working on reduction of our cold rolled steel inventory and believe our commitments and inventory will soon be in better balance with our production.

[fol. 5180]

ROME CABLE CORPORATION

PAYROLL STATISTICS

Our factory payroll covering number of employees, weekly payroll, average weekly wage and average hours worked for a period a year ago, six months ago and the last week available, as well as the number of monthly salaried workers for both Rome and Torrance are shown below:

	Week Ended	No. Employees	Total Payroll	Avg. Wkly. Wage	Avg. Hrs. Worked	No. Salaried
ROME	2/19/56	M 894 F 33 927	$ 97,844.69	$105.55	47.0	422
	8/19/56	M 872 F 31 903	$ 91,225.32	$101.02	45.3	448
	2/24/57	M 801 F 24 825	$ 70,580.79	$ 85.55	38.9	457
Torrance	2/18/56	131	$ 12,409.41	$ 94.73	40.2	44
	8/18/56	129	$ 13,844.66	$107.32	43.1	47
	2/16/57	135	$ 13,830.40	$102.45	40.4	48

There was a drop in Rome hourly employees of approximately 100 from a year ago. Half is caused by temporary layoffs due to reduced volume and inventory liquidation in February but the other half of the layoffs has been projected as efficiencies and savings from the start of indirect incentive plan in January 1957. Practically all of the increase in salaried workers represents change from indirect hourly to salaried method of payment and does not represent increased cost.

LABOR

Due to area and national competitive labor agreements we granted an approximately 5 cents per hour increase to all Rome plant employees on December 17, 1956, with an additional 7 cents in December 1957 and December 1958. This was accepted by IAM representing maintenance workers in the Rome plant. At the same time we announced an incentive plan for indirect workers effective January 1957.

[fol. 5181]

ROME CABLE CORPORATION

LABOR - Cont'd

On February 18th we signed a contract with U.S. Steelworkers representing Torrance production employees granting approximately the same increase to them, but only for the year 1957, with contract expiring in December of 1957. We agreed to investigate the possibility of indirect incentives at Torrance also. On this basis Rome should have clear sailing for approximately three years and we hope that the Torrance plant can negotiate their contracts in conformity with Rome.

It is distinctly evident that we are getting higher production with less manpower.

In January we offered free polio shots to all employees stationed at Rome on a voluntary basis. About 150 over age 40 indicated, in response to our questionnaire, that they did not wish to have them. The reception otherwise was excellent. We are making the same offer to our Torrance employees this month.

INVENTORIES

Projected inventory reduction of over one million dollars in the current quarter will be realized by March 31st. While our present policy of expanded consigned stocks and heavier finished stocks to provide better service to customers will mean our carrying somewhat higher inventories than will show at the end of the year we believe it good policy to eliminate the band of 40 cents copper before March 31st.

WORKING CAPITAL

Our working capital should show an increase of over one million dollars over the previous year. We will pay off our $1,000,000 of short-term loan before the end of the year and will have reduced our long-term debt by $460,000 in the current year.

PRICES

Prices for all poundage products have been reduced with each producers' reduction in price of copper. Reduced volume in insulated products accelerated competitive granting of additional discounts. Some of the worst offenders with extensive discounts have recently published new policies, which, if followed and considering copper cost reduction, should bring margins more nearly in line with December and early January levels.

Our prices for Rigid Conduit are being increased this week to reflect recent increased steel and labor costs.

RENEGOTIATION

We have agreed with the New York Renegotiation Board covering fiscal year ended March 31, 1953, net cash affect of which is approximately $52,000, for which we had ample provision in our tax reserve. This determination was somewhat higher than we had hoped. Mr. Sarles was successful in having them agree to consider to handle the years 1954 and 1955 jointly, so that we should be able to include termination expenses in 1955 and 1956 to offset what they may consider excessive profits in 1954. We believe our reserve should

[fol. 5182]

ROME CABLE CORPORATION

RENEGOTIATION - Cont'd.

cover their determinations. It must be remembered that we still have to clear Washington on the above findings.

TAX REFUND

The Internal Revenue Code for 1954 presented an opportunity for a different handling of property taxes. Working with our accountants, Ernst & Ernst, our Comptroller's Department has filed claims for refund covering fiscal years back to March 31, 1952 which in the aggregate should give us a refund of $109,198 plus approximately $30,000 in interest. Local representative has approved the refund and it remains now to get further executive action from the Bureau

DIVIDENDS

I recommend payment of Dividend No. 72 at the rate of 35 cents per share to share owners of record March 18th, payable March 28, 1957. I also recommend payment of cash dividend to employees on the same date at 17-1/2 cents per participating unit, and that a contribution of an additional one-third of that amount be added to the Rome Cable Employee Profit-Sharing Trust Fund.

A 5 per cent stock dividend to share owners of record December 14, 1956 was distributed on January 4, 1957.

EXECUTIVE BONUS

We made payment of $175,000 on current year executive bonus in November. On the basis of projected earnings I recommend approval of an additional disbursement of $125,000 to those members and in the percentages authorized at the last June Board Meeting.

PROFIT-SHARING TRUST

As of the first of March the Profit-Sharing Trust has a book value of $83,800, market value $91,400 or an appreciation of 9%. It has a yield on book value of 4.76%. Approximately $14,000 more will be added to the fund on March 28th.

PENSION

On March 1st we had 409 employees covered by Pension Plan started in 1944 with Bankers Life Company of Iowa. As of now 11 employees are currently receiving pensions under this Plan.

Under the Pension Plan started August 1, 1955 we now have 62 people drawing pensions. We have paid Massachusetts Mutual $147,000 which completes our commitment for the current year. We are getting 3.75% interest on this money. In the Trust handled by J.P. Morgan & Co. Incorporated we have securities with a book and market value of $334,000, with a current yield of 4.08%. I believe we should accrue $300,000 for payment to the bank trust fund some time prior to June 15th, which is in keeping with our plan inaugurated last year to get maximum tax amortization and clear up back service payments in eleven years.

[fol. 5183]

ROME CABLE CORPORATION

ROME CABLE FOUNDATION, INC.

At the last Directors' Meeting we voted Rome Cable stock and cash in amount of $40,000 to the Foundation. An additional $35,000 will have been accrued by March 31st on our books. I recommend that at least this $35,000 be given with possible consideration for an added contribution.

As of March 1st the Foundation had assets having a market value of $285,000 with an estimated annual income of $12,000. Expected disbursements before the end of their fiscal year will total $6500. and preliminary budget for the new year will total $40,000.

SALES BUDGET FOR FISCAL YEAR 1957

In accordance with past practice we have prepared an estimated sales budget for the fiscal year starting April 1, 1957. This shows total dollar expectancy of $53,000,000, which is up about 2% from the current year. Overall quantity increase, however, is expected to show an increase of 7%. We are expecting profits, however, to show an increase of 14%.

CAPITAL EXPENDITURES

Total capital expenditures for the current fiscal year will approximate $800,000. Sale of one of the Properzi units and other sales reduced cash outlay by approximately $100,000, compared with depreciation and amortization for the year of $768,000. We charged operations with sale of $67,000 of obsolete equipment. Disposals of other fully depreciated or obsolete equipment will bring gross additions therefore to approximately $500,000.

At the last meeting we informally approved $500,000 for Rome and Torrance, exclusive of the new laboratory. Their new requests for the next year total $482,000 for Rome and $90,000 for Torrance with a carry-over of $400,000 from prior year approvals. This would bring total carry-over and requests to $972,000, of which it is estimated approximately $250,000 would be carried as a cash cost to fiscal 1958. With an expected cost of $425,000 for the laboratory this would mean potential cash needs of approximately $1,150,000 which deserves considerable discussion in the light of the above sales budget and estimated profits for the new fiscal year. It also points up the importance of consideration of possible other means for financing research and development laboratory, as will be discussed later.

On the basis of the above figures I recommend that we give Rome approval for $250,000 and Torrance for $50,000, with a further review in the light of conditions at our May and/or June Directors' Meetings.

The original 1955 plant rearrangement program is reasonably complete, with the exception of receiving department and basement operations of synthetic extrusion. New plastic mixing was put in operation during the current quarter with excellent results and is operating at a $50,000 per year saving. Major items still to be delivered in

[fol. 5184]

ROME CABLE CORPORATION

CAPITAL EXPENDITURES - Cont'd.

1955-56 program are bull block and enameling machine. We expect the bull block to be in operation by June 1957 and the enameling equipment by May 1957.

ADVERTISING BUDGET

In the current year it is expected that we will have spent approximately $240,000 for advertising against a budget of $262,000. Our Sales Department with our Agents and Advertising Dept. proposed a budget for the new year of $340,000 which total figure has been incorporated in our total expense budget for the new year. Cost of space has increased $32,000 alone. A sizable amount of the increased budget comes in the field of public relations, on which expenditures cannot be made until the latter part of the year. I therefore recommend that we approve a budget of $275,000 for the new year and consider how much additional we may want to give them at the June Board meeting. I am well pleased with the full program as submitted and hope we can give full approval at the June meeting.

RESEARCH & DEVELOPMENT

At the last meeting we tentatively approved the sum of $350,000 for the construction of a new laboratory. Since that time we have engaged the firm of Charles Butler & Associates to act as architects and consultants with our organization. There is on view here today an artist's conception of the proposed building, which has pleased all of us who have seen it.

Preliminary estimates indicate the cost will run approximately $425,000 for approximately 26,000 sq. ft. of floor space, 7000 ft. of which is in the basement the larger part of which will be for pilot plant purposes. I recommend tentative approval of the revised estimate of $425,000, pending actual bids. If we can act promptly completion should be sometime in November.

For some time past our Secretary has been checking with our counsel and auditors on possibility of financing the new laboratory, either through the Foundation and Pension Trust or Foundation and some other financing agency, such as an insurance company, on security of a long-term lease of the property to Rome Cable Corporation. A special report will be presented to the meeting outlining all of the details and I hope we can have a full discussion at the meeting and determine on a program of procedure.

In connection with the new laboratory we must pursue vigorously the reclassification of present personnel and secure three top men in the fields that Dr. Schatzel needs to start his new program.

[fol. 5185]

ROME CABLE CORPORATION

ORGANIZATIONAL CHANGES

Since Stuart Barrett's death the Comptroller's Department assumed responsibility for much of his work. In the interest of good organization and because of the rapidly expanding work involved in some of the fields it was determined that such items as taxes, pensions, employee dividends, profit-sharing trust, stock purchase plan, salary administration, insurance and Foundation matters should properly come under the Treasurer's jurisdiction. Therefore, effective March 1st Donald R. Fraser, Assistant Comptroller, with several other employees previously handling the above programs were transferred to the Treasurer's department. This will relieve our Comptroller's Department of considerable detail and also place the above functions where they more properly belong in the Treasurer's department.

NEW YORK STOCK EXCHANGE

In the belief that we now have the proper qualifications I recommend we pursue the matter of listing on the New York Stock Exchange some time after the issuance of our next annual report.

T. J. COPE, INC.

In December there was called to our attention that a company by the name of T. J. Cope, Inc. manufacturers of cable accessories, troughs and racks, was for sale. Since that time we have had several of our officials meet with their people and expect to have some figures to review at the meeting on Thursday. The principal owner has died and the company is now being run by trustees who are anxious to sell. Our sales, engineering and manufacturing people speak well of this company's reputation and their organization.

We had a meeting with one of the Trustees, who is also their auditor, the son of the former owner, and the General Manager on Wednesday, March 6th, reviewing their financial figures and discussing policies and methods of operation, which will be reported on for discussion and action at the meeting.

B. F. GOODRICH CO.

Earlier in the year we received a report from B. F. Goodrich Co. covering a new type of conduit made with Geon. We understand that we are the only conduit manufacturer to which they have brought this detailed report. We all felt it had enough interest to cause us to have certain tests run at Torrance and Rome, and certain investigations made with the Underwriters and checks on the cost data furnished. This might prove an interesting product addition to Torrance, where we feel increased load would produce excellent returns.

[fol. 5186]

ROME CABLE CORPORATION

GENERAL

The final quarter of the current fiscal year will be disappointing from an earnings and sales volume standpoint. However, elsewhere in the report is the projected level of operations for the new fiscal year which we feel is reasonable of attainment despite the current situation.

We continue to receive inquiries as to our willingness to sell or diversify, or expand, in other directions and all of such inquiries of merit are carefully checked and appraised by our staff. Certain announcements, and some rumored acquisition of presently operated units in the wire industry by large aluminum and copper producing units are naturally going to affect our industry and must be carefully appraised. We still believe that our ideal method of expansion would be acquisition or merger with other strong independents to broaden our line.

Respectfully submitted,

H. T. Dyett

H. T. Dyett, Chairman of the Board

[fol. 5187]

E.R's approved since last meeting of the Board (Nov. 29, 1956):

	E.R. No.	Description	Amount	
ROME	1796	Materials and labor to construct building between Bldgs. 1 and 12	$35,000	
	1817	Purchase and install one metal enclosed 2300 volt gang operated three pole load break switch for installation on power mezzanine in Bldg. #20	2,500	
	1818	Purchase and install a three stand flat rolling machine with necessary edging rolls and two takeups	50,000	
	1819	Supply materials and labor to construct an enclosed stairwell in Bldg. 16	10,000	
	1820	Purchase a Model 1938 Addressograph Machine	3,200	
	1821	Purchase one Executive Electric Battery Runabout	1,000

PLAINTIFF'S EXHIBIT 129

Confidential

A. D. R. Fraser & H. T. Dyett
J. H. Dyett
March 11, 1957
Revere

Dear Ross and Dad:

This afternoon Rudy, Charlie and I had discussions with Louis Glesmann, Harold Wilson and Ed Barnard on the subject of buying aluminum pig from them.

Olin-Revere expects to be in production in late 1957, but Revere is anxious to make lasting connections with several outlets prior to that time. Evidently they have aluminum on contract from other sources which they can spare until such time as their own Ohio property is ready to deliver which would be some time in the first half of 1958 with full production in late 1958. G.C.C. evidently is trying a new Kaiser aluminum specification pig shortly, and we should get the results of this run. We are also expecting to get 100,000 of this new material.

They made it quite plain that they had been quite worried about policies of the integrated companies. I said that this had been also foremost in our minds and that integration was a very serious problem to the independents. They stated Revere did not expect to go into the wire business. There was no indication that they had heard the rumors which we have, but it is probably natural that they wouldn't divulge anything.

One very important thing that came out of the meeting was that Olin-Revere was being set up as a non-profit organization and that Revere would receive its metal at cost. I wonder if this would be true of our southern friends. This provides very serious food for thought.

In speaking of the future I said that we would give them every consideration owing to our very close relationship with Revere. However, we could not lose sight of the fact that Kaiser had helped us during very tough times and

that any switch on their contracts from delivery to Revere to delivery to Rome Cable would be known by Kaiser and we wondered how they would react to this. We made it quite clear that although we were optimistic on the future of aluminum that the policies of the integrated companies would determine to an appreciable extent the rate of our growth in this field. Mr. Wilson stated that they wished to enter into five year contracts. I gave him the history of how we had avoided these in the past and anticipated doing it in the future. Not knowing the policies of the aluminum companies over the next few years we are in no position to tie ourselves up in this manner. Louis Glesmann stated that he was sure they could arrange something that would be satisfactory to both parties.

It was left that we would have further discussions in May or June, but I gave no indication that we could place any business at that time. It was a very friendly meeting and should be considered in the nature of purely exploratory. We gave Mr. Wilson our specifications.

Indications were that Revere wished to sell up to 15,000 tons of their 60,000 ton allotment from Olin-Revere thinking that other aluminum suppliers could take care of them for anything above 45,000 tons a year when excess demands required.

Jack.

PLAINTIFF'S EXHIBIT 130

To: All Salesmen
From: D. H. Thayer—Rome
Date: March 29, 1957
Subject: T. J. Cope, Inc.

I am sure you will be interested to learn that, as of Monday, April 1, we have bought the plant equipment and other assets of T. J. Cope, Incorporated, Collegeville, Pennsylvania. Operations will remain in Collegeville and will be conducted under the name, T. J. Cope Division, Rome Cable Corporation.

We make this announcement with enthusiasm for in this further diversification of our product line we also broaden our service to the electrical industry, particularly with respect to the utility and industrial markets.

As many of you know, Cope has been a pioneer and leader in the development and manufacture of steel cable troughs, trays and racks along with other related products. Use of these items is becoming more widespread with the increased utilization of high voltage cables and promotion of interlocked armor construction. We feel that the sales possibilities for Cope products are very promising and the Cope name enjoys an excellent reputation in the trade.

While we take over the Cope organization on April 1, there will continue to be many problems connected with the integration of its functions with our own, particularly as they may influence sales policies. As soon as these can be resolved you will be fully advised.

Presently, Cope products are sold nationally through appointed agents. For your information a list of such agents is attached. No change in this set-up is contemplated for the moment but it is a matter that will be given thorough study. I believe you can appreciate, also, that there will be many problems of distribution, warehousing and sales policy to be clarified for smooth functioning. In the meantime, we wish we might have your thoughts and specifically request that all District Managers let us have their suggestions or recommendations.

We wish to cooperate fully with the present Cope sales organization. We should lose no opportunity to promote the sale of Cope products. A letter of announcement, as per the attached copy, is being mailed to our customers and it is suggested that you acquaint yourself with their requirements for cable troughs and trays.

If you are not already acquainted, please make a point of knowing the Cope representative in your area toward the end of working with him whenever possible.

Very truly yours, D. H. T.

ROME CABLE
CORPORATION

ROME, N.Y.

REPORT SUBMITTED TO THE BOARD OF DIRECTORS
OF ROME CABLE CORPORATION AT THEIR MEETING
MARCH 4, 1958

I present record of sales and earnings after taxes by fiscal years from 1937 to date, and by quarters for the current year, the month of January and estimates for February and March:

Fiscal Year Ended	Net Sales			Earnings
March 31, 1937	$ 1,798,092			$ 1,616
March 31, 1938	4,957,103			71,027
March 31, 1939	5,370,665			245,036
March 31, 1940	6,080,902			297,736
March 31, 1941	9,465,451			431,501
March 31, 1942	11,631,785			592,135
March 31, 1943	12,712,333			367,654
March 31, 1944	16,909,735			466,709
March 31, 1945	22,798,218			486,653
March 31, 1946	16,975,009			398,973
March 31, 1947	18,436,305			1,359,593
March 31, 1948	25,202,853			1,152,579
March 31, 1949	26,088,523			1,115,960
March 31, 1950	19,602,984			302,209)
		Plus: Transfer from contingency reserve		150,000)
				452,209
March 31, 1951	35,142,901	Net	$ 1,922,136	
		Minus: Transfer to Copper Reserve	150,000	1,772,136
March 31, 1952	42,657,848			1,753,651
March 31, 1953	54,632,976			2,008,321
March 31, 1954	44,114,825			1,637,787
March 31, 1955	39,186,095			930,879
March 31, 1956	56,996,682			2,023,070
March 31, 1957	52,790,055			2,255,819
April-June Quarter	13,420,000			351,000
July-September Quarter	11,009,000			352,000
October-December Quarter	9,810,000			228,000
TOTAL NINE MONTHS	32,239,000			931,000
January 1958	3,209,000			56,000
February (Est.)	2,483,000			(58,000)
March (Est.)	2,748,000			(46,000)
QUARTER TOTAL	8,440,000			(48,000)
TOTAL FISCAL YEAR (EST.)	$ 40,679,000			$ 883,000

[fol. 5192]

ROME CABLE CORPORATION

From the ten months comparison with the same period a year ago Rome plant profits dropped over $1,100,000, approximately one-half of which is due to decreased volume, most of the rest is due to reduced prices between the two periods, mainly on construction wire items.

The current quarter has continued the downtrend in sales, particularly at Rome and mid-February additional 12-1/2% price reductions is the main reason for the loss of $48,000 (8¢ per share) recorded for the quarter. Projected profit break-down for the current year for the three plants is -Torrance $449,000, Rome $361,000, Cope $73,000, a total of $883,000, or $1.58 per share.

With the rapid changes in volume and the drasti c affect of the sizable price reductions it is almost impossible to accurately predict earnings.

SALES AND ORDERS

The breakdown of sales before deduction for discount and freight from April to February, with February estimated, are as follows:

	April 1957 Feb. 1958*	April 1956 Feb. 1957	% Increase or (Decrease)
Rods	$ 4,760,000	$ 5,392,000	(11.7)
Bare	4,428,000	7,463,000	(40.7)
Weatherproof	1,318,000	2,293,000	(42.5)
Magnet	1,920,000	3,461,000	(44.5)
Rubber Covered	15,116,000	20,553,000	(26.5)
Aluminum	3,406,000	4,889,000	(30.3)
TOTAL ROME	30,948,000	44,051,000	(29.8)
EMT	2,411,000	2,466,000	(2.2)
Industube	519,000	486,000	6.8
Rigid	4,232,000	3,450,000	22.7
TOTAL TORRANCE	7,162,000	6,402,000	11.9
COPE	1,905,000	-	-
GRAND TOTAL	$40,015,000	$ 50,453,000	(20.7)

* Preliminary

For the fiscal year our total sales are estimated at approximately $43,000,000 compared with $55,000,000 a year ago, or a decline of 22%. Thirty-one per cent in Rome and an increase of 6% in Torrance.

On a quantity basis, using copper and aluminum, at Rome, we show an expected 18% drop between the two years. At Torrance a 2% drop in steel usage.

[fol. 5193]
ROME CABLE CORPORATION

SALES AND ORDERS -Cont'd.

While the final total for incoming orders on copper products is not completed for February the total looks as if it will exceed January by about 5% and be the best total since November. We are predicting another 5% increase in March over February.

Incoming orders for Aluminum products is off slightly in February.

Torrance showed expected drop from inflated January levels but should show at least 10% better in March than February.

Cope expects to be better by about 10% than February.

BACKLOG OF ORDERS		Value
February 1, 1958	Rome-Copper Products	$ 1,757,000
	Aluminum	139,000
	Torrance -EMT & Industube	84,000
	Rigid	42,000
		$ 2,022,000
August 31, 1957	Rome-Copper Products	$ 2,453,000
	Aluminum	415,000
	Torrance -EMT & Industube	87,000
	Rigid	20,000
		$ 2,975,000
February 8, 1957	Rome-Copper Products	$ 2,897,000
	Aluminum	513,000
	Torrance -EMT & Industube	48,000
	Rigid	177,000
		$ 3,635,500

The above figures in dicate practical elimination of any backlog. With continued weakness in the copper market and industry generally, customer purchasing is largely on a near-term basis which requires sizable stocks to service and adds to the complications of manufacturing with a reduced force where prompt service is the means of getting an order. This obviously adds to the cost of production.

RAW MATERIAL

All the materials we use continue in plentiful supply although most of the world's copper producers have announced cutbacks in production, the United States Copper Association figures indicate that to date this has been talk rather than action. Until supply, which has exceeded demand for two years, approaches demand, we feel that copper prices will remain at depressed levels.

Copper product sales by fabricators in January dropped to 57,000 tons, a reduction of 35,000 tons from December and by far the lowest month in many years.

[fol. 5194]

ROME CABLE CORPORATION

PAYROLL STATISTICS

	Week Ending	No. Emp.	Total Payroll	Avg. Wkly. Wage	Avg. Hrs. P/Wk.	No. Salaried Employees
ROME	2/10/57	M 864 F 30 894	$ 80,952	$ 90.55	40.3	457
	8/18/57	M 812 F 24 836	$ 75,111	$ 89.85	39.8 *	476
	2/23/58	M 665 F 30 695	$ 63,412	$ 91.24	39.8 **	456
TORRANCE	2/16/57	135	$ 13,830	$ 102.45	40.4	48
	8/1857	135	13,983	99.81	39.8	54
	2/16/58	115	12,413	107.05	40.0	55
COPE	4/20/57	57	$ 4,176	$ 73.26	40.3	34
	8/24/57	62	4,741	76.47	41.9	34
	2/22/58	54	3,750	69.44	37.0	34

* Includes 13 switched from hourly to salaried, 7 students and 13 summer help.
** Includes 13 switched from hourly to salaried and 7 students.

From the above you will note that the number of hourly workers has been reduced approximately 200 at the Rome plant, while the number of salaried workers remains approximately the same. Twenty of the additions to the Rome salaried payroll are due to transfers from hourly workers and the seven new students we have in our Student Course this year.

This subject has been given a great deal of study in Rome and plans are already laid for the reduction of approximately 29 people in the current year due to retirement, resignations and contemplated reduction in force. Further studies on ways and means of reducing this will be discussed at the meeting.

[fol. 5195]

ROME CABLE CORPORATION

LABOR

We signed a contract with the Steelworkers representing our production people at Torrance running to October 18, 1959, which granted 7 cents per hour increase on December 16, 1957 and 7 cents on October 13, 1958. We also granted an eighth paid holiday and extended the same Health Care Plan that we had at Rome. This contract contains nothing other than what we had granted in Rome contract, and is the same as was voluntarily granted in December of 1956 before we had a Union in Rome.

We have had more than our growing pains in working out details with the Union at Rome. They have had a sizable number of petty greviances which have regrettably taken a great deal of our top manufacturing people's time. I believe, however, most of it has been necessary to get across our position and we were ready to go to arbitration to establish our viewpoint on seniority in lay offs. Present indications are that the Union leaders are backing down in their claims owing to evidences of discontent among the members. The sizable number of layoffs in the last three months necessitating "bumping" of jobs has added considerably to our production problems.

INVENTORIES

In January our inventories were reduced by approximately $950,000 from December. We expect to effect an additional reduction of $200,000 to $300,000 before the end of the fiscal year.

T.J. COPE DIVISION

Our Cope Division has had a downturn in sales in the last few months. This, plus inventory adjustments necessary after the final settlement will cut into profits to the extent of about $25,000 in the current quarter and end the year at an estimated $73,000. Total sales for the year will run just under two million dollars. The organization is doing an excellent job and is confident that we will hit two and a half million sales in the new fiscal year They have just brought out a new catalogue, which is an excellent sales help.

They are working on two new products, a bus box and a Geon wireway. We hope these will be available early in the new year.

Allan Ziegler is very anxious to have us get a larger tract of land for future expansion, as his present location is very limited. I think this should be deferred for the time being.

TORRANCE

Torrance will have a record year in both sales and earnings. They are right on schedule in their work on the equipment and installation to produce 2-1/2 to 4" rigid conduit. They expect to have this available by October 1st. Fortunately, prices have been quite stable in the conduit business, and are improving in the Industube, after a very competitive period last Fall.

[fol. 5196]

ROME CABLE CORPORATION

PRICES

As previously mentioned price cuts mainly in construction wires and low voltage power cables cost us almost half a million dollars, compared to the 1956 similar period. Another seventy-five to one hundred thousand dollars can be added to this in February and March. The wire industry is a sorry contradiction to labor's contention that manufacturers move prices up with each wage increase. Despite an 80% rise in wage rates from the end of World War II we are today selling many items considerably below prices in effect at that time. We have a great deal of evidence showing improved manufacturing efficiency in reduced costs but even these cannot keep pace with such unrealistic pricing methods.

COST REDUCTIONS

When our capital equipment program of $427,000 at Rome is completed it should show savings of approximately $12,000 per month. One-third of these have already been accomplished and it will rise to one-half before the end of the fiscal year. Industrial engineering savings through new incentive rates will total approximately $40,000 per year. We have not been able to fully realize the estimated savings from our indirect labor incentive, owing to lowered volume and changes in personnel due to layoffs, so that it is a bit more difficult to estimate actual savings during the current period. They should exceed $100,000 per year in more normal production periods.

With the closing of our Cafeteria by May or June and substituting automatic dispensers we will save an estimated $50,000 to $80,000 per year.

We have just reorganized our Cost Reduction Committee and our latest estimate, which I have in detailed form, projects actual items which will generate cost reductions in Rome running $200,000 to $250,000 annually.

INDUSTRY STATISTICS

From the various industry statistics which we have available to us we can tell you that use of copper by wire mills was off 10% compared to 1956. Our own consumption of copper bolstered by heavier toll production was also off 10%. Because of our efforts to "hold the line" on some price sheet items we lost some ground in our proportion of construction wire and low voltage power cable products, and thin wall conduit. We maintained our position, or bettered it, in magnet wire, cords, molded cords, and cables, plastic control cables, and had a sizable increase in our proportion of rigid conduit. Despite the most unrealistic type of competition by some of the large aluminum producers our proportionate loss in the manufacture of our own aluminum insulated wire did not suffer as badly as we feared. With ALCOA making all their own plastic wire in the past year our total volume of production on this item, of course, was much curtailed.

[fol. 5197]

ROME CABLE CORPORATION

SALES BUDGET & EARNINGS PROJECTION FOR FISCAL 1958

The original sales budget for fiscal '58, prepared in January, showed a 10% increase over estimated '57 on Rome products, 8% on Torrance and 25% on Copo. I cut this estimate 10% right down the line, which brought overall volume estimate to approximately the 1957 level with lower activity in the early part of the year and heavier in the latter half of our fiscal year. Taking this figure and using January sales prices and various cost reductions mentioned elsewhere in this report, produced a profit estimate of approximately $1,100,000 or about $2.00 per share. At construction wire prices 7-1/2% below January for the year the result would be approximately $850,000, or $1.50 per share. Taking the latest reduction of 12-1/2% the estimate would run approximately $625,000, or $1.10 per share. We must not lose sight of the fact that on the basis of past history in this industry further price reductions, and our policy to really meet competition could definitely affect these estimates. On the other hand history has demonstrated that such periods of most unrealistic prices have been relatively short lived.

CAPITAL EXPENDITURES

We have been able to save approximately $300,000 on the original estimate of required capital expenditures for the current fiscal year. As matters stand now we expect to spend $1,517,500 cash outlay in fiscal 1957. We will carry-over $498,500 and approval is requested for $311,500 for the new fiscal year. This would bring, without consideration of any carry-overs into the next fiscal year, total expected cash outlay in fiscal 1958 of $810,000. Projected depreciation for that year is $966,000. A table showing the planned distribution of expenditures, carry-overs and 1958 requests is as follows:

	1957 Expenditures	Carry-overs	Requested 1958
Rome	$ 1,274,000	$ 228,000	$ 140,000
Torrance	223,000	257,000	150,000
Copo	20,500	13,500	21,500
	$ 1,517,500	$ 498,500	$ 311,500

RESEARCH

Our laboratory building is about 90% completed and it is hoped that we will move early in April. Total cost including consulting services will be $675,000. The equipment originally estimated at $100,000 is expected to be covered with a total of $75,000, of which all but $13,000 will be in current year approvals.

We are encountering difficulties in locating a man for Assistant Research Director. Most of the desirable candidates are already well settled and are loath to change. Dr. Schatzel believes that progress will be better when we can actually show them the building. We feel we have a candidate for the mechanical engineer needed, possibly within our own organization.

[fol. 5198]

ROME CABLE CORPORATION

RESEARCH - Cont'd.

We are studying appropriate program for formal opening the new Research Center with program commensurate to the current economic situation, without, however, losing sight of the great potential value that a dignified proper opening would, we believe, pay dividends in the future.

NEW PRODUCTS AND DEVELOPMENTS

Our enamelled rectangular magnet wire is now in the hands of some customers for tests. It was a necessary addition to our line if we were to maintain our position with our customers in the heavy magnet wire field. We are pleased with the results from our new flat rolling equipment. Production coming off that equipment for the Simplex order for use on the trans-Atlantic cable is adjudged the best we have ever produced.

While we have not had any major new products added to our insulated wire and cable line during the past year we have made noteworthy strides in instrumentation cables for computers and missile launchings. We have been asked by Haseltine, a sub-contractor for IBM, to add to the sizable volume we have already been producing for them. The original request covered some Teflon cables and our engineering and research department has developed a new specification and made a sample, using foam polyethylene. We believe that this new construction can be profitable.

In the current fiscal year we have sold over $600,000 of instrumentation cable through January. I have been well pleased with the high percentage of orders we are getting on quotations made. I wish to commend Engineering, Research, Production, Accounting and Sales for the fine cooperative effort on these products. With heavier defense expenditures in this field our sales volume should continue to grow, and our new cabling capacity planned two years ago will come in to excellent use when it is installed in the latter part of the next quarter.

We are also working with certain other customers on special projects which could add considerably to our volume. Our new research facilities will certainly be very helpful on these programs, and our timing in having them available is none too soon.

DIVIDENDS

Conditions have changed rapidly since our last meeting and our earnings estimate has been reduced. Even with all of the uncertainties it seems probable that we will finally end up with an amount slightly in excess of the $1.40 per year rate. Our dividend policy has always been on a conservative basis and in the two prior periods where we only earned our dividend or slightly more, in fiscal 1949 and 1954, we paid at the then regular rate. Estimates of current and future earnings, as well as cash flow, will be presented for the Directors' consideration in determining the declaration at this time. Whatever declaration is made should also be followed through as far as the employee

[fol. 6199]

ROME CABLE CORPORATION

DIVIDENDS - Cont'd.

dividend and profit sharing trust are concerned. I believe there is merit in considering and even announcing to the employees a potential modification by the time of the next dividend action. We will have discussion on that and the legal reasons for such, if taken, will be presented.

ADVERTISING BUDGET

We cutback our advertising budget for the current year by $55,000 in Rome but Cope exceeded their budget by $20,000, owing to the catalogue price exceeding estimates. The Advertising Department has prepared an excellent budget and requested $366,000, $293,000 of which is for Rome and Torrance. These budgets are somewhat lower than submitted by our agencies. At this time I believe we should limit our total to $300,000.

I feel our newly reorganized Advertising Department has done an excellent job in the past year.

PENSIONS

Forty-nine additional people have been added to the salaried pension plan insured with Bankers Life and there are now 444 people covered under this plan, with 12 drawing pensions and 69 drawing pensions under our latest plan from Massachusetts Mutual.

Our estimates of earnings included only payment of $350,000 on Massachusetts Mutual-J.P. Morgan, Incorporated Plan rather than $481,000 which would give us eleven years payment on back services and would save us $861,000 for interest charges versus the thirty year refunding covered by payment of only $350,000. It is recommended that payment of $200,000 be made to J.P. Morgan & Co. Incorporated for the supplemental pension trust before March 31 and that power be given to the Executive Committee for review of any additional payment depending on year-end results and the possible tax advantages, without charging the full amount to current year's earnings. We get 3-3/4% on money deposited with Massachusetts Mutual. Our pension trust had a book value of $649,000 at December 31, 1957 and a market value of $621,000, with an estimated annual return of approximately $28,000, or 4.30%.

PROFIT SHARING TRUST

Our Profit Sharing Trust had a book value of $133,000 at December 31, 1957, market value of $130,000 and annual return of approximately $7,000 and yield at book value of 5.32%.

[fol. 5200]

ROME CABLE CORPORATION

ROME CABLE FOUNDATION, INC.

At the last meeting we approved $25,000 contribution to the Foundation. Earnings figures presented include another $25,000 grant before March 31st. I recommend that we approve another $25,000 to the Foundation for the current fiscal year, as their cash balance will be nearly depleted by March 31st.

As of February 28, 1958 our investment portfolio had a cost value of $298,000 and market of $275,000 with an annual income of approximately $17,000, or about 5.7%.

EXECUTIVE BONUS

With predicted earnings the executive bonus will be either nothing or probably not more than $30,000 to $50,000 compared to $406,000 a year ago. This represents a compensation loss of approximately 40% to all the members on a full participation basis and one-half that to those on an half participation basis. This further brings out that the modification that we made two years ago was not adequate and I believe somewhat unfair from a tax angle to the participants, as well as endangering morale. I believe that study should be started which could take into consideration some plan of deferred payments or spread payments on high years over an extended period, as some companies do, in order to make our rates of compensation compare more favorably at all times with others in the industry.

RENEGOTIATION

We have at last been advised by the New York office of the Renegotiation Board that they are willing to make settlement for the years ended March 31, 1954 and March 31, 1955 for a gross amount of $250,000, net after all tax corrections of approximately $48,000. This, if approved by Washington would give us a higher rate of earnings return in these two years than in the previous years which we have closed. Their offer was made early in February and we should hear from Washington prior to the publishing of our annual report.

TAX REFUNDS

We have been negotiating with the Syracuse Internal Revenue Office for a refund of $109,000 on certain past years. They have conceded $33,000 and our auditors feel that the full $109,000 will be allowed. The Syracuse office has written to Washington for a ruling.

[fol. 5201]

ROME CABLE CORPORATION

EXPANSION AND ACQUISITIONS

Discussions with Alwalt were delayed by them until they could take an inventory and prepare new financial data covering the first nine months of operations under the new incorporation, with separate manufacturing and selling units. These figures have just been received with no time to analyze them as I write this report. A letter from their attorney to Walter Danielson, our attorney in Los Angeles, talked of a figure of $1,500,000 as a purchase price, which on the basis of previous financial data is out of all reason. I will discuss this matter at the meeting.

We also received from Manufacturers Trust an inquiry as to whether we might be interested in acquiring William Brand Company of Connecticut. We do not have all of the data that we requested on this company, but a preliminary review of what we do have does not stir up too much interest in our Executive Committee. This will also be discussed at the meeting.

Hardly a week goes by but what we receive some kind of letter on this subject. At our "Whither Goest Thou?" meeting I asked Jack Dyett to review our studies and bring them up-to-date on several companies in the industry that we have discussed from time to time. At the same meeting Charlie Ellis was asked to prepare estimates for a unit to produce certain plastic wires at another location, with Glenn Rolston providing a list of favorite locations from market viewpoint. A study has also been asked and started on possible production of certain instrumentation wires on the West Coast.

"WHITHER GOEST THOU?"

Our annual "Whither Goest Thou?" meeting was held about two weeks ago, and in addition to a number of the subjects previously covered in this report, we had full and frank discussions, and assignment of responsibility where needed, on competition, sales policy, consigned stocks, communications, new products, new processes, new equipment, budgets, etc. I feel it was a most constructive and decision making meeting.

ORGANIZATIONAL AUDIT

Two weeks ago we also had our annual organizational audit meeting. I feel that overall our organization today is stronger than it has been in many years, but our meeting emphasized a number of problems. Within the next five years and still more when we stretch our sights for ten years we are faced with retirement of many men who have been most influential in their contributions to the growth of our Company. Some are talking of earlier retirement.

We have a wonderful group of young men coming along in the Company. For two or three years I have urged that these young men be given greater responsibility and authority to better prepare them for their future responsibilities. Our student program has proven an effective means of adding new blood to the organization.

[fol. 3202]

ROME CABLE CORPORATION

In such times as these I hope we will not color our decisions to discourage the enthusiasm of our organization and make some of them seek elsewhere for the kind of opportunity that they expect, and, with the future of our industry we should be able to provide. I hope it is not going to be necessary to eliminate our student program for the new year. I hope also we will actively pursue getting the necessary additions to our organization in the several spots that conditions and new developments indicate are necessary.

GENERAL

This has been a long report but we felt it advisable to outline in more detail than usual some of our problems and give you an indication of what we are trying to do about them. We also hope it will form a background for decisions and policy making. These are perilous times for many companies but we still continue to have great faith in the future of the electrical industry, and the great needs of utility, equipment manufacturers, chemical, mining, oil and other industries which we serve.

Respectfully submitted,

H. T. Dyett

H. T. Dyett, Chairman of the Board

[fol. 5203]

E.R. No.	Description	Amount	
1886	Purchase and install a Pratt & Whitney gauge on flat rolling machine	$3,000	
1887	Purchase and install four gauges	3,500	
1889	Purchase 1 roller type take-up with reel ejector	2,685	
1890	Purchase and install wire preheater for plastic extruder	3,000	
1891	Purchase and install new wall hung and floor cabinets, sinks	11,700	
1895	Purchase and install one IBM Time Recorder and Relay	500	
1896	Purchase and install Thurnam-McGeoch hopper, heating and loading machine	3,500	
1897	Purchase and install two hoods and stacks over saturators in Reflex finishing machines	1,100	
1898	Purchase J&C welder for C.V. Machine	600	
1899	Purchase a Davis portable combustion analyzer	975	
1900	Purchase and install an Addison Electric Co. diameter control system for use on #4 plastic extruder	1,800	
1901	Provide stainless steel ventilation hoods over the pickle tank and hot water rinse tank in Rod Mill	12,000	
1902	Purchase and install Pratt & Whitney gauge on three strand rolling machine	3,000	
1903	Purchase 1 elec. operated plastic welding torch	150	
1904	Purchase 3 adjustable coil blocks to coil Triplex	3,150	
1905	Purchase 2 special 6" extrusion screws in CV & Tuber	3,000

[fol. 5205] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 133

September 2, 1958.

Rome Cable Sales Meeting

Engineering Session

R. A. Schatzel

I want to extend greetings to everyone and to issue to you a cordial invitation to drop over and visit these new Research facilities of yours. I notice that our time is pretty short this morning, and so I will not take much time to go into any elaborate generalities but get down to the business at hand, and that is, to provide you information, and to help you do the job that Ross has outlined and that we all have before us.

The competitive picture you know better than I, and it isn't alone a picture that we control in this country—it's one that we have a pressure from many other places, and yet I feel that we have met that kind of competition in the past and that we can, and will meet it now, but you will have to make the best use of our abilities and our facilities.

Before going into those, I'd like to introduce Dr. Fuller —would you please stand. Dr. Fuller is our Consultant. You've heard about him many years he's been with us, but today he was able to make it.

As you know, we do not have a Student Training Course this year, so I don't have a group of students to introduce to you. That doesn't mean that we have abandoned the idea, we may still have some, but at the moment we don't.

During the year we have not added appreciably to our Staff. The only new addition, I believe, is Steve Jovanovitch—would you stand please. Steve has had 12 years experience in the cable industry in England and we think, will be an addition to our Product Development Dept. in the Laboratory.

[fol. 5206] Most of you have been over to visit our new Research and Engineering building, and I don't need to describe very much the building itself. Those that have not, I'm sure will be there, and we'll see that you're taken

through and told something about what is in it. One of the things that you'll notice as you come in is the display in the Lobby. We're going to have a permanent display there, and we hope both the building and what's in it, is going to be something that will be of use to you in selling our products, in selling your customers on Rome Cable. In that display that you will see over there—at the present, there's some improvements to be made, but in general it will show the products we make, the materials we use in making them, and the typical applications of them in photographs which will be above. In addition to that, we expect that we will have some outstanding products—say of the month, or the products that we have led in as the leader in the Industry, Rome Firsts. Those are not there now, but they will be as we get that display completed.

Another thing, in going through a building, it's hard to visualize just what it's for, and I'm going to try to outline that to you very briefly now.

As we said last year, our Laboratory facilities, (and we hope that this will help you with your customers), are divided up into a number of laboratories which are coordinated through our Director of Research. We hope that in each one of those, that they feel their responsibility for their own growth and their own development, and that they feel that they have a responsibility for ferreting out problems and bringing them to us, as well as for us to bring them to them.

[fol. 5207] We have a Metallurgical Department which is equipped now with a small foundry in the basement, with a unit that can hot roll, cold roll, draw, heat-treat, do the metallographic and other testing. It can do metallographic work complete from melt to the finished product on a laboratory scale. The only thing that is not complete in that, and which we do not need at the present time, is spectrographic work, and that we can get locally, and we can also get overnight in New York—so there's nothing at the moment that we lack there.

We do have some important problems because this whole thing with Ross, as outlined this morning, is one where an industry is growing in precision and control. Those are the things that are meant by Automation. Those are the things that develop a greater output per manpower hour;

those are the things that mean reduced cost and increased quality, and those are the things that we're trying to prepare for and have to do—there's no way out of it. We're going to meet competition. We're building in that direction; we have a Product Development Department which is under Mr. Duffy, and directly reporting to Mr. McCutchan, and that we're reinforcing. That is a large department, including the Electrical Laboratory itself, because you cannot do product development without evaluation, and that is the function of those two departments. I might say subdepartments of the other, and in that you will notice that we are not complete, but we have under way plans for developing equipment that will allow us on a small scale, to do taping, to do processes that we cannot do in the plant; to duplicate others that we do in the plant, and at the same time, test products developed. Such things as the great number of synthetic fibrous tapes that are coming out, we [fol. 5208] couldn't possibly use in the plant at the present time.

Another thing which we are faced with, and that is a thing that we hope to meet, is that with all these new materials that are coming out, one of the limitations placed on them by all of us and by industry generally, excepting the few that are now stepping out as leaders, is that when we bring out a new synthetic material we make it a condition that it work on our present equipment, and immediately we start modifying that new material until we have lost its real advantage in properties and have made it fit a piece of equipment which it wasn't designed to do. Materials and equipment go together; sometimes have to be designed one to fit the other. We're doing the whole problem now, by making the material fit the machines we have, and the processes we have, rather than to design new equipment, new processes to make best use of materials that are developed. That will be also part of that department, along with the Mechanical Dept. which is already in being, and which you've seen upstairs. We have also a Analytical and Control department there for approvals of new materials and development of methods which will work with this expanded Technical Superintendent's department; an Organic Chemical Laboratory, which will work not alone with suppliers, but to modify or develop Polymers and

resins, particularly needed for our own use, and with that a group which we called Instrumentation last year. I think perhaps the better name is Applied Physics, in the upstairs Laboratory, which is investigating many of these newer developments in order to see where they best fit into making a better product, improving the process or improving our methods of making them.

Those are things that are expanded; some of them are [fol. 5209] new, but when you go over I want you to see that building as a unit—not as these separate departments—because it's only through their coordination and their work together as a team, that they become useful; but to make them all conform to just one particular pattern is not going to be what you're going to see; they're going to have a blueprint of the man at the head of it.

Our Plastics and Rubber department is quite complete and, I think, will be the most versatile I know of in this industry—capable of duplicating any process that we have in the plant and of exceeding that, because we will have in that department equipment for extrusion of rubber and plastic products that at the moment we won't be able to handle in the plant. But through the work that we do there, the guidance for the handling of them in the plant and the guidance to our plant engineering for the development of similar equipment will be given.

I've mentioned the Technical Superintendent's department during the week, and I think Charlie will want to expand on that, but that department has been expanded and we have transferred a very capable man as the head of it, in Lee White whom you've met before, and I won't ask to stand now; but that department will control the day-to-day technical operations of the plant.

Another department that I want to mention which hasn't been expanded, but which has been developed further, and perhaps later in the morning discussions can come on that, and that is, the Quality Control Dept. The Quality Control Department, working closely with our plant production, is [fol. 5210] your representative, the same as the general or overall inspection is, in holding up the quality of products during process, and at the request of our Production Department and with their help they have evolved a plan of what we call "Workmanship Audit" in the department.

By regular inspection they are checking to see if machines are properly set up, that the materials are properly kept, that the workman is making his necessary checks, and so forth. Then a regular form which I can't go into with the limited time now; if you fellows are around any time and are interested in that, I'd be awfully glad to show it to you, because we believe that it is another tool in meeting this competition, and it's a tool which Rome Cable has been getting some recognition for in this particular field.

I don't need to talk about our Inspection. P. Isom has been doing an excellent job, and I think that the department is working so closely with the Quality Control Department in setting up inspection procedures, that we can be proud of it.

Now I'm not going to have too much time to touch on many of the other things that I have here, but they'll come out later. Some of the items that have come up in the year —some of the items that you fellows have been particularly interested in—are what we are doing on Triple AC Alloy to meet Kaiser competition. We've investigated that. We have had wire in here, we've endeavored to buy rods so we could draw it ourselves, but that was impossible; but we have been able to offer and are offering, the 5005 Alloy, which is an alloy that Reynolds brought out two years ago. It is also available, I believe, to Alcoa, and as far as Triple AC goes, that seems to be a pretty good answer at the present time. However, there is another new development coming in and that is, this one of Copperweld, the Alumoweld. [fol. 5211] Alumoweld is about what we talked to you several years ago, and each year during the past several years that Alcoa was developing. But Copperweld went to Battelle Memorial Institute and have developed and are offering a 30% conductivity Aluminum Clad Steel Conductor, which can be processed and drawn, and we can purchase that through Copperweld. At the present time their production is limited, but they are building a plant, and I think that sometime early next year it will be available in quantity; but samples are available right now and we'll get some information out to you in the field after we evaluate it. You do have available, 5005 Alloy, and in our estimation it is a very excellent material as a competitor to the Kaiser Triple AC.

We also had a number of questions during the year about the 62% conductivity of Kaiser and its advertising and competition. The question has come, why we don't do it. We have not been able at the moment to meet 62% conductivity on hard-drawn wire. We meet 62% conductivity on rolled rods; we can meet and do meet about 61.8% on hard-drawn wire. The question has also been asked by you —does Aluminum Co. meet it? To the best of our knowledge they do. We are working with the suppliers of aluminum to improve on the Pig that is supplied to us, and we are making progress. As we said, our rod itself does meet 62% conductivity, but not the drawn wire—we are trying to do that. However, we'd like some guidance from you as to its importance. Our own estimation of it is—it's purely a gimmick—it has no importance. The difference between 62 and 61.8% conductivity is less than the variation in dimensions that are allowed, and its effect on the opera-
[fol. 5212] tion of a line is negligible; but I do know that it is a factor in advertising, and if you have trouble with it you should let us know and we'll see that we can do to help you.

Hi-Density and Cross-Linked Polyethylene

Now the next thing that I have on my list is Hi-Density Polyethylene. In that connection there's a great deal of work being done, but you'll hear more about that I think, during our discussion. We feel that it has at the moment; a limited used. It's diffcult to remove from wire, and there is some question about some of its properties—environmental cracking, and other properties, when it's put on in certain films, but I might say this, that all that we have supplied, and the only source that we use, has none of those weaknesses, that we can find. The only weakness that it does have is its hard nature and difficult removal from wire, and it doesn't seem to have advantages other than the higher softening point and abrasion resistance.

Another development in that is what is called a cross-linked. You're hearing from that from G.E. as Vulkene. Well, we are working on that, and may have something later to tell you about it. It may become available on a license agreement, or it may become available through some of the work we're doing with another company who

are working on this product. Many of you want to know what cross-linked is, anyway. Cross-linking, if you look at this thing as a material that has molecules lined up in chains in parallel direction. Cross-linking would be a method of bonding those two chains at various points, like those two tables down through here. If you could put a spike across them, that would be a cross-linking of those parallel chains. It's the same thing as vulcanization; it's [fol. 5213] not carried out with sulphur or the same process, but it means the same thing as vulcanization—so if after it has been cross-linked, it has lost a good deal of its thermoplastic property, and has a much higher melting point and much greater toughness. Now that is one of the things which I think during the year you'll hear more of, and just wanted to assure you that we're working on it.

Spacer Cable

I have one other item that I think I'll cover in spite of the fact that we're trying to hold to a time schedule, and that is, the development of the Spacer type cable and what the situation is on Spacer type cable. When that came out we took the problem of developing a competitive material, and mainly our Electrical Lab. product development group, particularly Duffy and Marwick, came up with some ideas of designs which were tried out, and we finally hit on a design which we think has advantages, and at the same time avoids the patent of Hendrix. Now the fact that Hendrix has three patents—there's only one that we are concerned with. Hendrix Spacer has two parts, identical but in reverse, so that as you put them together they become clamped around the cable. Now that is patented and that patent is specific. Every claim in it requires that the clamp be made of two identical parts, which in reverse, form a closed clamp around the cable. Now that is patented and that patent is specific. Every claim in it requires that the clamp be made of two identical parts, which in reverse form a closed clamp around the wire. In his patent also, is a claim or claims on a system, which he calls a cable, and that includes the wire, the messenger and the clamp itself as a cable system. For a long while that stumped us, even though we had a clamp. The question was, what is the [fol. 5214] interpretation of the system, and what has

Hendrix been allowed? Does the fact that he has a patent on a cable system, including a cable clamp, mean that he has a patent on a cable system that includes every cable clamp, insulated clamp, because the use of metal cable clamps or conducting cable clamps is old, but his is specifically an insulated cable clamp; so does he have a patent which says that his patent covers a system or a cable, including insulated conductors and messenger of all designs? Our patent attorney has given us an opinion that all the Hendrix claims are limited to a cable system in which you use a clamp that has two like reversed sections only. Any other clamp that does not infringe his clamp is not covered as a system. So that we feel free now to say that we do not infringe his clamp or his system. You might ask then, why did Flowers get out of it? Well, Flowers had a clamp which also included two reverse sections and directly infringed Hendrix's Clamp. Therefore it also infringed on his system, but the question of whether we have a patent or not is still to be settled. We can't say that we have a patent—we do say that we are free, that we do not infringe Hendrix's Clamp or his claims of a system, and therefore, this will be given to you to sell. Now Glenn and I have talked about this and Glenn will outline more completely the policy on which this will be done. But essentially, as far as the construction is concerned, the system we will offer will consist of Spacers and the insulated conductors with the grommets—the messenger will be optional. Our recommendation for a type of conductor will be either aluminum or copper conductor insulated with Tree wire thicknesses of high-molecular weight Polyethylene; that's [fol. 5215] our recommendation. That is not what probably the great majority will use, because from a look over the orders, they are ordering everything from full thickness of PVC, full thickness of Hi-Density Polyethylene, full thickness of high-molecular weight Polyethylene, Butyl or Oil-base with Neoprene, and those are all ordered as the insulated conductors, and so they're all standard conductors. There's nothing special about them; they can be furnished, and yet you'll want some recommendation of a standard from us and that will be it; (Tree wire thickness of High-molecular weight Polyethylene)—yet we could furnish any of these others, and Glenn, I think, had better out-

line that to you. Now through the Cope Division we will also be able to recommend accessories for pulling-in.

Rome Cable Manual

Our Rome Cable Manual which is out now just a year and the second edition is a year old. 50% of them are out in the field—we still have 50%, and it would be helpful if you would send in as you did in the past; any comments or criticisms or suggestions. Generally those come in the first part of the offer—it doesn't come so much later.

Regarding the Spacer Cable, you will be sent a bulletin of instruction, and an instruction for installation. We'll also send you a complete Spacer of this type with the grommets, and I think that will give you all that you need for this particular purpose.

A Few Items of Industry Activity

The ASA held a conference last month to discuss the need and practicability of a National Building Code. This was sparked by H. Luce, Editor of Life. While there was strong sentiment for it, there was a great deal of opposition from powerful segments of Industry, including Labor. [fol. 5216] The chances of its formulation are not bright.

Mr. Selden, who is Chairman of the NEMA Technical Committee on Conduit is now also alternate to our Jack Edwards as a member of The Codes and Standards Committee, as well as on Code Making Panel #6. Mr. R. C. Graham continues for a third year as a Vice-President of IPCEA and who have done a great deal of important work to be later discussed. The following changes adopted or to be adopted by the Code will affect you during the year:

A. New Wire Type TBS. Thermoplastic insulated, braid covered switchboard wire rated 90°C. Approved in sizes 14 through 4/0. This product is designed to replace Type A. We have submitted and have obtained U/L listing.

B. Ozone-resistant insulation must be used on all wires rated over 2 KV. This will prohibit ordinary Type R, RW, etc. from use over 2 KV. Sizes 14 and 12 limited to 2 KV maximum—#10 limited to 4 KV and #8 to 5 KV maximum, i.e. #8 smallest size for 5 KV.

C. New wire Type SA. Silicone insulated, glass or as-

bestos covered wire rated at 90°C. for use in dry locations. For special applications can be rated at 125°C. Would be recognized in sizes 14 thru 2000 MCM.

D. Shielding of high-voltage cables will be by means of metallic shield only, no semi-conducting shields in the future.

E. NFPA Raceway Fill Investigation—Interim Amendment #110. No official action taken as yet by Code Panel. Confusion has delayed this program. May still be clarified so that recommendations of the Committee can be adopted in the 1959 Code.

[fol. 5217] F. THW—Code Panels have accepted proposal submitted by Rome, Simplex, and Plastic Wire. Will be rated 75°C. dry or wet in sizes 14 thru 500 MCM, 3/64" minimum insulation thickness. U/L expected to adopt Code recommendations.

We are aware of the fact that several of our competitors have issued specifications for High-voltage Butyl rubber compounds with requirements in excess of those of IPCEA and ASTM. We have authorized you to meet such specifications in some cases. Our compound does meet them. It is probable we also will issue such a specification in an endeavor to develop a uniform standard of this kind.

[fol. 5218] In United States District Court

Plaintiff's Exhibit 134

To: Mr. J. R. Woods
From: C. J. McMurry
Date: December 5, 1958
Subject: Knoxville Utilities Board, Knoxville, Tennessee

Dear Jack:

Gene had been pressing to see if we could not get on the approved list for KUB for aluminum bare both all aluminum and ACSR. The approval for this might have its bearing in the future becouse there is always the possibility that KUB will switch to aluminum triplex, etc. in lieu of the copper bare and weatherproof to which they are

now sticking. Gene was told that if we are on the approved list of TVA for aluminum, there would be no hesitancy on the part of KUB in putting us on the approved list. However, then Gene ran into the stumbling block as he found we were not on the approved list at TVA.

It seems that the procedure with TVA would be to request approval of our aluminum products and that TVA would then arrange for probably two or three of their engineers to visit our plant, inspect our facilities and production and then give approval. Had we formerly been on the list and then removed, the plant inspection would not be necessary. Apparently however, we have never been on the approved list or made any effort to be in the past.

I hesitate to request such approval without consideration by you. Are we sure that there would not be an unfavorable report because if there were to be, it could have a deleterious effect with others of the large municipals in Tennessee.

The other question is whether it would be worthwhile because based on the competitive situations that usually develop with any sizable inquiry (and practically all TVA requisitions for this type conductor would be large) we just let ourselves open for a lot of useless quotations. If we fail to quote, we would be removed from the bidding list although I do not feel that this would affect our status as being an approved supplier.

I would appreciate your comments.

Sincerely, C. J. McMurry.

CJMcM:wg

P. S.: Gene advises that we are approved at Chattanooga Electric Power Board, Nashville Electric Service and Memphis Light, Gas & Water Dept.

J. R. Woods—Rome
December 10, 1958
Knoxville Utilities Board

Dear Mac:

The reports we have have been receiving from you and others would indicate that the pricing basis on Bare and ACSR is pretty firm. Based on very recent reactions to one cut in price, I would have to assume that they will remain firm or a new sheet will come into being. This being the case, it would seem very desirable to be on the approved list with this customer.

If approval at Knoxville requires TVA approval, I would think that it would be well worth the time and effort involved. You must bear in mind, of course, that our ACSR capability is limited to those sizes which require a one steel strand core wire. In other words, our approval from TVA would be a partial or limited approval. I can foresee no reason why an unfavorable report would be rendered by TVA engineers, particularly in view of the fact that we process our own aluminum from the pig and also our years of experience in the manufacture of overhead conductor. I think we should actively pursue the TVA approval.

Very truly yours,

——, ——.

PLAINTIFF'S EXHIBIT 137

cc: Stew Johnston—Chicago

R. R. Davis—Kansas City
J. R. Woods—Rome
December 24, 1958
Iowa Power and Light Co., Des Moines, Iowa

Dear Bobby:

I think I can answer your questions in your memo of December 22nd as follows:

1. Yes, I believe it would be attractive for us to pursue this customer to the tune of 20,000 ft. of Carp and a little weatherproof per month. I don't think we can ever afford to overlook this type of business which when all added up is really the backbone of our production.

2. This question requires a little crystal balling that neither of us are capable of at the moment. I don't think that we really expect anyone to give you an unqualified statement to the effect that we will be competitive regardless of the going price. I might mention in this regard that there was a time prior to going to the 15 and 7½% discount when we had to face up to the issue of either going to it or going out of the business. As bad as that price level was we elected to meet the going competition. I think our investment in our future is so tied up with aluminum that we will continue to make this decision even if it hurts our pocketbook in the worst way. Naturally, of course, this is a decision that is made on a higher level and I can only recommend that we ride the roller coaster and I assume that my recommendation would be honored. The only thing that would keep us from going along with a particular customer like this would be a situation where many of our big customers were willing to pay the sheet price or a modest discount from it and a small account like this demanded something better. We always have to look at these situations pretty closely because we think we are darn fools to spoil our situation with the big people for the sake of maintaining

good relationship with a distributor and a very small amount of business with a utility. Previous history has shown that a situation like this doesn't exist very long because somebody does what we think we are darn fools to do and everybody gets the lowest price. There is, however, in this example, a period of time when we are not competitive. I might say that the current aluminum price situation looks better than it has for a very long time. I mentioned the story in Chicago but I will repeat it again here that for the last several months aluminum prices were very firm. We were only able to detect two cases of cut prices, both of them being on a public bid. The ink was not even dry on these quotations when Kaiser reduced the price to the level quoted on the public bids. If this is an indication of their state of mind and we believe that it is, [fol. 5222] then it would be logical to assume that as soon as anyone quotes at a price other than the correct list, we will immediately have a new list corresponding to the cut price. I, of course, cannot give you a certificate to this effect but I think it is logical to assume that that is exactly what will happen. In other words, I think that the aluminum industry has got its back up on this cut price situation and they are going to either straighten it out or die in the attempt. If you can accept this as fact, as I do, then I think it is safe to say that we will be able to keep this customer competitive. I have given you all the facts that I have at hand and I think that they are sufficient for you to make up your own mind as to whether or not you want to commit yourself to keeping this customer competitive. Personally, I think it is worth the chance and I would suggest that you do so.

Very truly yours, ——, ——.

ELECTRICAL CONDUCTOR DIVISION NEWSLETTER

The rate of production of bare cable during April showed but little change from the previous month. There was a 4% increase in aluminum weight, but the mills have ample capacity to enable them to step up their activity. Idle equipment means fewer jobs and reduced profit—neither of which is desirable.

Covered conductor activity, although not all that we hoped for, was, at least, fairly good. April bookings, although equal only to 70% of those for March, were 118% above the corresponding month of last year. Shipments were 27% greater than for March and 75% above April of 1954. New orders dropped to 72% of the March totals

but were 21% above the corresponding month of last year.

Comments have been made occasionally concerning our covered conductor business. It is true that we started from scratch in 1952 and there was only one way we [fol. 5224] could go—forward. I feel sure, however, that you will all be interested in the *rate* of advance as shown on the attached chart.

Most of you peddlers started selling conductor when, except for very limited quantities of weatherproof, everything was bare. Orders for bare cable often total a million pounds or more, and there is a real satisfaction in wrapping up a job of that size. However, to concentrate on bare cable and pass up covered would be a great mistake. From a profit standpoint, covered conductor means more to us than bare. Last year shipments of covered conductor in our district sales offices varied from 15.8% of the total down to a measly 0.016%. If we all work harder for this business, we can certainly show that the estimated rate of increase was established by a pessimist. Utilities usually buy covered conductor in moderate quantities just like we buy our bread and beans at the grocery store. If we can get them to do this weekly shopping with us, there is no reason why our sales of covered will not, within a few years, approach that of bare.

The aluminum weight of bare cable orders received during April showed a 10% increase over March and a 29% increase over April of last year.

The orders for 100,000 pounds or more aluminum weight are as follows:

Customer	Aluminum Weight—Pounds
Consumers Power Company	122,212
Dakota Electric Supply Company	134,789
General Electric Supply Company	247,884
Graybar Electric Company	1,188,083
Ohio Power Company	288,986
Pacific Gas and Electric Company	247,667
Priester Supply Company	108,243
Southern California Edison Company	282,725
U.S. Department of the Interior	1,830,715

[fol. 5225] In our March Newsletter we told you that more accessory orders were needed. Massena sat ablinkin' like a toad in a hail storm watching for them to

come in—but no soap. The result was that the Accessory Finishing Department was cut down to one shift as of April 11.

Bus as today's price should be as sought after as a buss from your best girl. There is activity in several sections of the country and Ray Campbell and Art Craig keep rooting up generator lead business just like young shoats in a pinder patch.

Chuck Appel started the wheels rolling with City of Seattle on the Duwamish Substation, and Buz Carleton took over when Chuck moved to New York. Because of teamwork between the Sales Department and Slim Mathews, Bob Wachter, and Wally Porter, in the Operating Department, we obtained an order for 22,000 pounds of bus and 25,000 pounds of structural material for the substation structure. Incidentally, they will also use our cable in the station.

All over the country large new buildings are being designed and constructed. These buildings will require bus duct, and we want Alcoa aluminum to be used. If you are not obtaining information from our architectural salesmen relative to these jobs, you are missing a good bet. They not only know what projects are in the wind, but they also can give you the name of the architect who will specify the kind of bus to be used. As an example, the University of Pittsburgh Schools of the Health Professions building was designed by a Chicago architect who specified copper bus duct. The electrical contractor wanted to use aluminum. Jim Holloman and Hal Kelly called on the architect and were successful in having the specifications revised to permit the use of aluminum bus. Phil Collins then got busy with the electrical contractor who called his source of supply for the duct and specified that the aluminum bus be Alcoa. Just another case of bringing the bacon home through cooperation.

[fol. 5226] It is surprising how far and to what extremes people will sometimes go in order to accomplish some desired result. At times they show as little judgement as the man in a no-limit poker game who backs a pair of treys against a royal flush.

Two customers recently built lines of 4/0 ACSR. Be-

cause they wanted to use a Burndy Y34A hand compressor for installing the joints and dead end assemblies —they had purchased Burndy joints—they had our Cat. 1875.2 dead end bodies and Cat. 975.2 jumper terminals turned down on a lathe to give them the same OD as the Burndy joints. Skip bites were used on the jumper terminal and part of the dead end body; *no compressions were made on that part of the dead end body between the lug and clevis.* We assume skip bites were also used for compressing the barrel of the steel clevis end. We will have a definite answer to this before long.

If anyone is planning a similar installation and asks you about it, tell them it is plain lousy. Mechanically this construction is probably good for about 35% of the ultimate strength of the conductor. We will make electrical and mechanical tests later.

A few years ago there was some demand for a loop-dead end that would accommodate cables larger than 2/0 ACSR, but we did not have an opportunity to develop one at that time. A Cat. 414 loop dead end suitable for 3/0 and 4/0 ACSR as well as 4/0 and 266,800 cm All-Aluminum is now available and can be shown in white data provided there is an appreciable market for it. Please let Mr. Dallye know your thoughts concerning this Cat. 414 for he does not want to authorize a stock at Massena or Vancouver unless there will be enough demand to justify production.

[fol. 5227] A few months ago we issued a brochure on our 12-ton compressor Model 12A. The pictures in this brochure showed the press without insulation on the body and handles, and the tables did not show the complete range of cable sizes that it will accommodate. The questions that you should answer for Mr. Dallye are:

1. Do you feel that the brochure is satisfactory in its present form or should it be reprinted using new pictures and revised tables?
2. Has it done any real good?
3. When the compressors are in the hands of our distributors, will having a supply of these pamphlets available to them be of much sales value?

We do not want to reprint the brochure unless it helps in our sales efforts, because we have a fairly good stock of the pamphlets on hand.

Through the years we have referred to our supervisors as cable supervisors. As a result some feel that their work is confined to bare cable. This is not the case. The supervisors are interested in and work with conductor of all types—bus and covered cable as well as bare.

The word "supervisor" does not fully describe the work they do, and we hope before long to use another term that will be more appropriate and more descriptive of the work they do. We have a number of ideas we are mulling over, and invite your suggestions.

The returns are not completely in for April, but March was the whoppingest best month yet for our agents and distributors. The comforting thought behind this is that every pound of this business is at schedule prices, and our distributor and agency organization is operating "in the black".

However, April will go down as the month of "wash sales"—sales "washed" through consignment stocks in- [fol. 5228] stead of being entered as agency sales. We cannot blame a distributor for wanting to make more money—that is his business—but we strongly censure the Alcoa salesman who permits the distributor to line his pockets with unearned, good Alcoa dollar bills. Our commissions and discounts have set a standard in the industry for fairness, and it ill behooves us to condone reception by "washing" agency sales through a consigned stock just to allow the distributor a larger discount or more margin with which to cut his price! We must all be constantly on the alert to short circuit any of these deals. Our contracts are specific in this respect, and we shall continue to scrutinize and refuse to accept in Pittsburgh those consignment orders which should be entered as direct shipments to distributor's customers.

L. H. Hemeter.

Re: Polyethylene Covered Conductors

For several months we have been watching the bookings, production and shipments of polyethylene covered conductors very carefully. It has been our thought that quite probably the time may have arrived for Alcoa to enter that field of production. We have now concluded that we should make a detailed study of the problem and arrive at a definite decision. A number of factors influenced our thinking and we believe it may be helpful to all concerned if I enumerate those factors:

1. Since our entry into the covered conductor field almost exactly three years ago via the medium of toll covering by Rome Cable Corporation, our business has increased (for all types of coverings) from zero to a predicted volume of somewhat over four million aluminum pounds for 1955. Despite two devastating price wars in electrical conductors during this period and despite our inherent "profit sharing" with Rome Cable Corporation, we have sold well over four million pounds of cable which we could not otherwise have sold, and at a profit.
2. Of the three predominant types of coverings—neoprene, polyethylene and textile, in that order—polyethylene appears to be running the best race. We estimate our conductor sales with that type of covering at about two million aluminum pounds for 1955.
3. Equipment costs and "know how" with respect to polyethylene are both much more favorable to the [fol. 5231] newcomer in the field of covered conductors than they are with respect to neoprene. Textile coverings may be disregarded since they are running a poor third.

4. The increase in popularity of polyethylene coverings has taxed Rome Cable Corporation's facilities to the point that for the past several months Rome Cable Corporation has been offering extended deliveries to its own customers, including Alcoa. This has resulted in our losing considerable business and some prestige.
5. We have lost and will continue to lose quite a volume of covered conductor business from a number of utilities who take the stand that Alcoa's toll arrangement with Rome Cable Corporation is "parasitic", i.e., to paraphrase: "Alcoa has done nothing constructive in the development and improvement of covering technics or lowering of prices and is, therefore, not entitled to any share of the business."
6. The fact that Alcoa does no covering of conductors is detrimental to the morale of our sales force. There is a fundamental pride in selling Alcoa made products which we constantly discern in our salesmen and which can best be illustrated by unanimous plea of our conductor salesmen that "we get into the covering game ourselves."

Our dealings with Rome Cable Corporation have been mutually frank and above board starting with the inception of our present toll arrangement. The Rome officials have felt right along that sooner or later we would probably enter the covered conductor field and we have never denied [fol. 5232] the possibility or even probability of such a step. The proposed study, therefore, need not be kept confidential in any way.

Sometime ago Mr. Vincent Matthews did make a confidential study with the help of Cost Accounting and our people at Massena to ascertain in a rough way whether our present volume of business would justify our entrance into the polyethylene covered conductor field. At the time we felt that if the study were favorable, the information would be extremely helpful in any of our future discussions with the Rome officials. I don't know whether the study has come to your attention or not, but it indicated that even with our present modest volume of shipments we

should break even and that increased utilization of the newly acquired facilities should bring a very satisfactory return on the investment.

On Monday, February 21, Mr. R. V. Davies and I spent several hours with Mr. A. D. Ross Fraser, President, and Mr. Glen Rolston, Vice President in Charge of Sales, of Rome Cable Corporation. The entire subject was discussed with complete candor and Messrs. Fraser and Rolston understand that we are going to make a detailed study and advise Rome Cable Corporation of our decision as promptly as possible so that they in turn may either expand their facilities to take care of the additional production load which would be imposed by Alcoa, or to perhaps take any other steps which might result from our decision.

If the proposed study verifies Mr. Matthews' earlier study and the decision is made to enter the polyethylene covering field, we would continue our toll arrangement with Rome Cable Corporation on neoprene and textile coverings and with the larger sizes of polyethylene coverings until such time as our volume of business might justify steps toward complete independence in the field. I believe, however, that we will always find it expedient to continue the toll arrangement on certain sizes of conductors and types [fol. 5233] of coverings because of the relatively small demand for those specialties.

I shall appreciate your expediting this study within reasonable limits so that if there is a favorable ruling from Management, we can take steps as promptly as possible. I have no personal knowledge as to estimated delivery on equipment and number of other factors affecting the time element, but the Rome people think that something on the order of six months to one year would be required until we could be in production. I think that any saving in time which can be gained without undue sacrifice to other important matters will pay good dividends.

Philip T. Coffin.

Re: Covered Conductors

Proposal for Alcoa to do its own Polyethylene Covering

In my letter of February 23, 1955 to Mr. J. P. Haight, I pointed out that there were a number of reasons for our giving immediate consideration to the proposition of Alcoa's producing its own polyethylene covered conductors, and requested that engineering and cost studies be made so that the matter could be investigated, and if sufficiently attractive, be referred to management for appropriate action. I attach a copy of that letter for your convenience.

On May 11th Mr. A. J. Stewart submitted a proposal for the installation of facilities at Massena for the production of covered aluminum conductors. I attach that proposal together with Mr. Stewart's covering letter. It is my only copy, so I shall appreciate its return in due course.

A number of conferences and discussions preceded the submission of the proposal, and as a result, it embraces a step by step program wherein we would start polyethylene covering at a modest level in 1956, increase polyethylene covering capacity in 1959, and also enter into neoprene covering in 1959—if we so elect. The proposal also embraces the installation, on a step by step basis, of equipment for twisting and testing triplex service drop conductors.

In my opinion, the proposal is well conceived and logical. It calls for a new building at Massena with provision for step by step building expansion, so that no unnecessary expenditures need be made ahead of actual re-

[fol. 5235] quirements. Conversely, if the rate of growth

of our covered conductor business exceeds our expectations, the step by step program may be accelerated. That such a possibility exists is shown by a few facts and figures:

1. Alcoa's shipment of covered conductors of all types has grown progressively from 65,000# per month in 1952, to 132,000# per month in 1953, to 200,000# per month in 1954, to over 300,000# per month so far in 1955. 32.5% of 1954 shipments were polyethylene covered as compared to 44.0% thus far in 1955. Alcoa is presently enjoying about 8-10% of the covered conductor business.
2. A recent survey by *Electrical World* reveals that whereas reporting utilities show 46% use of aluminum service drops, they plan to jump to 64% in the near future. Corresponding percentages for secondary distribution lines are 36% and 53%. Many of the non-reporting utilities are "die-hards," who will only resort to aluminum when driven to that move by even stronger economic pressure. We know of several such utilities who are making studies and a good share of their covered conductor requirements alone would or could double our present volume of business.

Our present belief is that our monthly shipments of polyethylene covered conductors should reach 160,000# per month by July 1956, and probably 200,000# per month by January 1957. Our cost accounting people estimate that if the first step of the proposal, representing a new expenditure of $736,000 could be in operation by July 1956, the annual rate of return on the investment would be 13%. The 200,000# monthly level would correspond to a 17% [fol. 5236] return, and the 15 shift full capacity level of 292,000# per month a 26% return. The highest return we have reached on the present toll basis is 9%.

The several factors enumerated in my letter to Mr. Haight continue to grow in importance. Up to last fall we were able to roll with the punches when occasional order jams, equipment failures and miscellaneous reasons resulted in some loss of business or prestige. Alcoa has now, however, become so large a factor in Rome Cable's opera-

tions and in the eyes of industry that one bad incident —of whatever cause—could set us back very severely in the competitive position we are just now on the verge of enjoying. We are now getting "bloodied up" with fair regularity and even at the moment are taking steps to do considerable of our own triplexing at Massena on a makeshift basis for some months, and at loss of considerable revenue, because Rome Cable simply can't handle the order load until new equipment—overdue, to be sure,—is installed.

History is bound to repeat, and with more violence. I, therefore, urge that prompt approval of the proposal be granted.

Philip T. Coffin.

Re: Covered Conductors

On May 11th, Mr. A. J. Stewart submitted a proposal for the installation of facilities at Massena for the production of covered conductors. That proposal has been carefully studied by a number of us in the Sales Department and I have just been advised by Mr. R. V. Davies that I have his approval to initiate a Request for Authorization based on that proposal.

The purpose of this letter, therefore, is to ask that the R for A be drawn up as promptly as possible so that when, and if, it is approved the work may be undertaken in time

to avoid winter weather conditions and thus more quickly put Alcoa in the business of covering at least a portion of the covered conductors it is selling at an accelerated pace. I understand that quick action will also result in considerable savings in construction costs.

A number of conferences and discussions among members of the Sales, Operating, Engineering and Cost Accounting Departments preceded the submission of Mr. Stewart's proposal, and as a result, it encompasses a step by step program wherein we would commence polyethylene covering at a modest level in 1956, increase capacity for that operation in 1959, and also enter into neoprene covering in the same year—if we so elect. The proposal also embraces the installation, on a step by step basis, of equipment for twisting and testing triplex service drop conductors. In short, the proposal avoids the expenditures of any funds, other than those needed for the initial step, until the volume of business and profits clearly demonstrate the need and justification for each successive step, each of which may be accelerated if necessary. That there is a strong possibility for the need of such acceleration is [fol. 5238] shown by a few facts and figures:

1. Alcoa's shipments of covered conductors of all types have grown progressively from 65,000 pounds (aluminum) per month in 1952, to 132,000 pounds per month in 1953, to 200,000 pounds per month in 1954, to over 300,000 pounds per month for the first six months in 1955. June shipments were 338,000 pounds. 32.5% of 1954 shipments were polyethylene covered, as compared to about 44.0% thus far in 1955. There is a pronounced trend in favor of polyethylene over neoprene, although the latter apparently will always have a sizeable group of adherents.

2. A recent survey by *Electrical World* reveals that whereas reporting utilities show 46% use of aluminum service drops, they plan to jump to 64% in the near future. Corresponding percentages for secondary distribution lines are 36% and 53%. These increases in the *amount* of use tell only part of the story, for there is also a very noticeable increase going on in the *size* of both service drops and distribution conductors. Many of the non-reporting utilities are "die-hards," who will only resort to aluminum

when driven to that move by even stronger economic pressure. We know of a number of such utilities who are making studies and a good share of their covered conductor requirements alone would or could double our present volume of business. One such utility was "converted" only last week and placed initial orders for 5,000,000 ft. of line wire, of which we received about 40%.

3. Repercussions of the strike at the plants of the Kennecott and Phelps Dodge Copper companies have become so serious that at least one copper wire company has ceased to accept any more orders until further notice. According to current newspaper reports, there will be a copper shortage of major proportions for many months after the cessation of the strike, so quite obviously there will be much more impetus to the swing over to aluminum covered conductors. The swing over to bare aluminum [fol. 5239] conductors is, of course, a matter of history.

Our present belief is that our monthly shipments of polyethylene covered conductors should reach 160,000 pounds per month by July 1956, and some 200,000 pounds per month by January 1957. Our cost accounting people estimate that if the first step of the proposal, representing a new expenditure of $736,000, could be in operation by July 1956, the annual rate of return on the investment would be 13%. The 200,000 pounds monthly level would correspond to a 17% return, and the 15 shift full capacity level of 292,000 pounds per month a 26% return. The highest return we have reached on the present toll basis is 9%.

The several factors enumerated in my letter of February 23, 1955, to Mr. J. P. Haight continue to grow in importance. We have now become so large a factor in Rome Cable's operations and in the eyes of industry that one bad incident, such as a major equipment failure at the Rome plant, could set us back very severely in the competitive position we are just now on the verge of enjoying. Rapid entrance into our own covering operation would largely remove such a threat. We are currently going through a bad period in our toll arrangement with Rome Cable because Rome simply can't handle their own and our combined order load. This situation is temporary in nature

because of the delay in new triplexing equipment for Rome Cable which has been on order for some months, but the same situation may very easily repeat and with more violence.

Philip T. Coffin.

Re: Rome Cable Corporation

I call your attention to the contents of Ross Fraser's letter of December 16th addressed to you as well as the contents of my letter of November 21st, 1955, to Glenn Rolston. As I interpret Ross Fraser's letter, the January 1st, 1957, date which I suggested to Glenn Rolston has been extended to May 1st, 1957, by means of Ross Fraser's letter. In other words, we would be free to make other arrangements with respect to neoprene covering any time after May 1st, 1957, unless the agreement is extended by mutual consent.

So far as a meeting with Ross Fraser, and I suppose Glenn Rolston as well, is concerned I am pretty well tied up on January 9th, will be at Massena on January 10th, and am again tied up on January 13th all day. I shall be in New York attending the AIEE Convention January 21st through 24th. I will try to avoid any further commitments until you have set up a date with Ross Fraser.

Electrical Conductor Sales Meeting

December 17-18, 1956

Our number one interest is the competitive price situation. We haven't been bothered very much in the bare conductor sales in our district so far this year, but have heard some serious rumblings recently. The bad situation in covered conductors still exists. The going rate is 5 to 10 per cent under our book price in this area. Are we planning to expand our covering facilities at Massena and go after it?

We are very much interested in Alcoa broadening its field of endeavor in the Electrical Conductor Industry. You know we have expressed our thinking on aluminum magnet wire application. We are also interested in seeing Alcoa take on insulated wire, building wire, welding cable, and other electrical applications. You are well aware that some of our competitors such as Kaiser are already producing some of these products in aluminum. Is Alcoa planning to do so? We hope Alcoa plans to continue to be the leader in the Electrical Conductor Field. In order to do that, we believe Alcoa must get into these other applications.

We are interested in the latest bus conductor situation. Are there indications of price cutting in that field? You probably know that Kaiser has tried to get in with G. E. in Cincinnati by offering them sawed plate bus conductor with a rolled edge at $.457 per pound. This is $.02 lower than our No. 2 EG alloy in 2,000 lb. lifts and is causing interest. We understand now that Kaiser admits they can

not do it. Our total with G. E. in 1956 is now past the [fol. 5242] 500,000 lb. mark. They plan to buy 1,000,000 lbs. in 1957 and we expect to get 80 per cent of that.

How is the program of bus conductor stocking at distributors progressing? As you know, Williams & Co., Cincinnati, is stocking 18 sizes of No. 2EC-T6 bus conductor. They have sold 40,000 lbs. since starting in August of 1956. We are estimating they will sell 200,000 lbs. in 1957. This compares to a tonnage of 500,000 lbs. of copper bus in 85 different sizes, sold in 1956. This includes sales through their Columbus, Ohio warehouse. The Williams people expect to be selling this much aluminum bus in the next three or four years.

Earl B. Cox.

ATlantic 1-4545, Ext. 467

For Release Wednesday, February 27, 1957 or anytime thereafter

Pittsburgh, Pa., February 27, 1957—Aluminum Company of America, long a supplier to the electrical conductor field, recently opened additional sales and use potentials with another new product—polyethylene-covered aluminum conductor. Simultaneously, Alcoa disclosed the fact that a completely modern covered conductor department at its

Massena (N.Y.) works is now in full operation, marking the first time the company has fabricated its own line of conductor covered with polychemicals.

Since making its first shipments in December, Alcoa has progressively stepped up production of covered conductors to the point where it has built up ample stocks and is in position to supply customers with covered conductor and service drops of the best quality and design available.

The plant's new equipment will cover single wires and stranded conductors in a large range of sizes. The finished product consists of wire or cable, covered with a relatively thin layer of protective and insulating polyethylene. [fol. 5244] In the process, cable is unreeled as it is fed through straighteners into an extruded head. Here the conductor *hets* its coating of polyethylene. Thickness varies with customer specifications. The covered conductor then passes through a controlled cooling unit which gradually reduces its temperature. After running through a series of pulling wheels, it undergoes thorough electrical testing before being wound into coils or reels for shipment.

This production method produces two similar products—line wire and phase wire. Line wire is single conductor distribution cable. Phase wire is a component of a twisted product, containing two or more conductors, and is employed in low-voltage, self-supporting secondary circuits and service drop cables.

To insure maximum quality control, both coils and reels of service drop are immersed in a test tank, where they are electrically tested for imperfections in the covering. Rejected reels are taken from the production line for further inspection and repair, if feasible. Those passing this final test are then carefully packaged for shipment.

November 8, 1957.

Minutes of Fall Meeting of Subcommittee on Electrical Conductors September 11-12, 1957

Conference Room—Alcoa Research Laboratories
Massena, New York

The following written reports were sent to the Members of the Subcommittee prior to the meeting:

Development Trends and New Applications—Mr. R. R. Cope, August 26, 1957
Production Situation—Mr. C. L. Kessler, August 26, 1957
Electrical Uses of Aluminum in Alcoa Plants—Mr. L. N. Grier, September 5, 1957
Review of Investigations at Alcoa Research—Messrs. Hartmann, McKee and House, September 3, 1957
Review of Investigations at Massena Works—Mr. C. L. Kessler, August 31, 1957

Mr. E. C. Hartmann, Chairman, called the meeting to order at 1.30 p.m. The following Members were present:

Members Present:

Mr. E. C. Hartmann, Chairman,
Mr. P. T. Coffin,
Mr. R. R. Cope,
Mr. F. R. Dallye,
Mr. L. N. Grier,
Mr. L. T. Guess,
Mr. H. E. House,
Mr. C. L. Kessler,
Mr. W. E. King,
Mr. J. S. Tompkins.

Visitors Present:
Mr. G. D. Welty, Chairman Technical Comm.,
Mr. J. H. DeKlyn,
Mr. E. G. Schoeffel,
Mr. N. B. Lane,

[fol. 5246] Mr. N. T. Bond,
Mr. H. H. Caldwell,
Mr. H. C. Dameron,
Mr. E. T. Engelhart,
Mr. L. C. Getsinger,
Mr. T. L. Gilbert,
Mr. A. C. Heath,
Mr. L. H. Hemeter,
Mr. A. E. Jennings
Mr. E. K. Lanctot,
Mr. W. F. Madden,
Mr. H. S. Marando,
Mr. G. H. Phillips,
Mr. C. B. Rawlings,
Mr. W. D. Stewart,
Mr. P. E. Stickley,
Mr. T. E. Simpkins,
Mr. O. F. Turner,
Mr. P. D. Tuttle,
Mr. J. C. Yedlika.

The minutes of the Spring Meeting were approved without changes.

Mr. A. J. Stewart, Member of the Subcommittee, who has been recently transferred to Cressona, expressed his regret, in a letter to Mr. Kessler, at being unable to attend the Meeting. The Subcommittee expressed appreciation for Mr. Stewart's services.

I. Market Conditions and the Competitive Situation

Mr. Coffin discused market conditions and the competitive situation. Although there is a good volume in Electrical Conductor sales, because of the price war which is believed to be the worst yet experienced, it is practically impossible to make a fair profit on Electrical Conductor products. Alcoa has one important asset, built up over the years of experience, to come out with new ideas and devices. This is especially true in conductor accessories. The outlook for future demand in electrical conductor products is very bright, for the use of electricity in the United [fol. 5247] States is approximately doubling every ten years. This of course calls for new construction and the

use of covered electrical conductor and accessories in addition to stranded conductors used for overhead transmission lines; bus conductors have become a very important phase of our operations. The use of sheet or foil for coils is expanding more and more as time goes on. Mr. Coffin stressed the importance of new ideas in the field of electrical conductors. He pointed out that the Members of the Subcommittee are well fitted to make valuable contributions along this line, with the consequent aid to sales. Mr. Lane raised the question as to the prospects for future business, and Mr. Coffin replied that with the expected growth in consumption of electricity that the volume for EC aluminum for 1957 should exceed the 250,000,000 lb consumption for 1956. This figure was released by the Department of Commerce, and it is estimated that 200,000,000 lb of this went into overhead electrical conductors. Mr. Welty raised the question as to the expected effect of the recent price reductions in copper on the aluminum conductor market. Mr. Coffin expressed the opinion that most authorities expect the price of copper to increase above the 25 cent per pound present price. It takes two pounds of copper to get the same current-carrying capacity as one pound of aluminum. Copper does have the advantage of lower fabricating costs than aluminum. The price of copper would have to drop to about 12 cents per pound, to make serious inroads into the electrical conductor market. The use of copper is coming back into the picture in the use of magnet wire and small transformers.

II. Development Trends and New Applications

Mr. Cope opened his remarks by stating that the present [fol. 5248] price of copper has not discouraged the activities in his division in extending the use of aluminum by electrical manufacturers. It is appreciated that the present low price of copper may prolong many activities and postpone switches from copper to aluminum in many products which require considerable fabrication, such as bunched conductors, but that eventually aluminum will be used in these products. None of the manufacturers expect the price of copper to remain at the present level. One important field in the development of the use of aluminum is strip or foil windings for transformers, relays, and simi-

lar apparatus. The Commercial Research Division has recently completed a study which estimates 200,000,000 lbs of aluminum will be consumed in the manufacture of windings using foil or strip. This type winding has a much better space factor than the winding made of wire. Provisions are being made at New Kensington to wind prototype coils made of foil to customer specifications. Methods are being developed to insulate effectively between turns and also methods to prevent short circuits at the end of the coil when large coils are sliced into smaller coils. A sales training program is planned to enable salesmen to sell foil and strip for magnet wire applications. This program is backed by the Technical Committee, the Capacitor Foil Committee, the Aluminum Process Development Laboratories.

Last June a meeting was held in Philadelphia to promote the use of aluminum in busway, which was attended by 168 people. This group consisted of architects, contractors, consulting engineers, distributors and other interested parties. Plans are under way to hold similar meetings in Los Angeles and San Francisco.

[fol. 5249] Edward Ashley and Associates have completed their study on the use of aluminum in the building industry. The report is quite extensive, and will be presented to a group in Pittsburgh on September 19. This study covers the use of aluminum, not only in electrical conductor, but such items as conduit, metal enclosures, switch boxes and so forth. They also made a survey of contractors to learn their thinking on the use of aluminum in the building industry. Edward Ashley and Associates are the consulting engineering firm who did the Alcoa Building and the office building at the Davenport Works.

III. Production Situation

Mr. Kessler reported on the production situation at Massena. There is quite a large forward tonnage for Expanded ACSR on the books, but for standard types of ACSR the future appears to be uncertain at the moment. There is quite a backlog of armor rods; there is quite a heavy load of both tapered and straight armor rods. About 140,000 sets of Alcoa armor rods were sold, compared to 23,000 sets preformed armor rods. All of the equipment author-

ized by the Committee for the Covered Conductor Department has now been installed. Operations are proceeding satisfactorily, each month production is becoming more efficient, costs are improving nicely.

At this point Mr. Kessler asked Mr. Jennings of the Massena Cost Accounting Division to review the cost analysis of the Covered Conductor Department. Production was begun in November 1956. Production has increased steadily and costs have been reduced. 236,000 lb aluminum weight, covered conductor was produced on the average [fol. 5250] the first six months of 1957. Mr. Jennings presented charts comparing Massena production costs for covered conductor compared with covered conductor made for Alcoa by Rome Wire and Cable Company. Each successive month showed improvement in Alcoa cost figures. It was pointed out that Rome costs include profit for Rome, and Massena costs are expected to get still lower so that the margin of profit will be better. Mr. Guess said that it would be easier to analyze the operations if the costs were broken down so that direct comparison between our operations and Rome could be made for separate items. Mr. Kessler pointed out that the starting material costs of bare conductor was the same whether we covered at Massena or whether Rome covered it. It was agreed there is still room for considerable improvement in reducing Alcoa costs of covered wire. Mr. Kessler reported that the initial troubles which were experienced in covering 600 volt conductor were overcome.

Recently an inquiry was received from the Long Island Lighting Company for #8 Conductor insulated with 110 mils Polyethylene. A quotation was not made on this item because the test equipment required to meet the 11,000 volt a-c and 33,000 volts d-c test is not available at Massena. The present maximum a-c test voltage is 5,000. $8,000. would be required to increase a-c test voltage to 20,000 volts. Mr. Kessler asked for an expression of opinion from the committee on the advisability of securing this necessary test equipment to meet such specifications. Mr. Coffin and Mr. Guess both expressed the opinion that we would not be justified in purchasing this equipment at this time. Perhaps later on when we have more experience in this field we could branch into the higher voltages. Mr. Grier

pointed out that with higher voltages, more problems would [fol. 5251] be encountered, one of which is shielding, and it appears that until all the problems are successfully solved in the manufacture of 600 volt class conductor, higher voltage conductors should wait. It was agreed by the members of the Subcommittee that this is the course that should be followed, and no high voltage test equipment should be purchased at this time.

There are now 330,000 lbs, aluminum weight, of covered conductor scrap which have to be salvaged. Recently, the amount of scrap received per month has exceeded the amount reclaimed. An engineering study indicates that about $10,000 would be required for new equipment to adequately take care of scrap. Mr. Kessler inquired of Mr. Coffin if it would be the continued policy for Alcoa to take customer scrap for reclaiming, and Mr. Coffin replied that this would be a necessity to maintain customer relations. Methods of reclaiming scrap were discussed, and it was pointed out that a great deal of scrap comes in briquettes, which is Polyethylene and Neoprene mixed, in which case the only method practical is by burning. In the case of long lengths the insulation can be stripped. It appears that both methods of reclaiming scrap will be necessary. Polyethylene scrap can be reused, neoprene cannot. It was recommended by Mr. Coffin that suitable scrap handling facilities be provided.

About 756' non-returnable reels are being shipped each month. There has been a big demand for non-returnable reels, although some customers do not ask for them. Mr. Turner reported that Vancouver is going to have some 66" reels on experimental basis, of the non-returnable type.

Mr. Phillips reported that non-returnable reels had been quite successful even when used in very rough terrain in [fol. 5252] new line constructions. Mr. Kessler reported that 50 96" aluminum reels were on order and scheduled for shipment in November. These reels are made of 6061-T4 aluminum alloy. It is planned to use these reels for expanded conductor. An economic study will be made comparing aluminum alloy reels and steel reels to determine which is the more economical. Recent shipments received of returned wooden reels at Massena showed 48% had to be scrapped. The returnable type wooden reels are only

averaging about two trips. Mr. Kessler reported that the August 1st inventory of 84" reels in steel was 1,117. These reels cost about $200. each. The reels occupy two Massena Works Smelting Plant buildings for storage. Mr. Kessler asked for an expression from the committee as to what should be done with the reels. Mr. Coffin pointed out that 300 had been sold to Kaiser after they had been used for two years. Steel reels at Vancouver are even a greater problem than at Massena because of the lack of indoor storage facilities. The reels must be painted every time they are sent out. Mr. Coffin spoke of the various tests for mechanical strength and corrosion, and the aluminum reels had passed these tests successfully. It is believed these reels would be good for a minimum of twelve trips compared to a long time average for returnable wooden reels of only two and a half trips. The one question on aluminum reels is whether the customer will accept the full cost of the reel as a deposit. The Sales Department will investigate possible purchasers of surplus steel reels. Mr. Kessler pointed out that it would be quite helpful if the conductor salesmen used every effort to get the customers to use steel reels, especially in view of the very poor performanc of wooden ones. Mr. Coffin and Mr. Phillips both advised that this was being done.

[fol. 5253] Mr. Dallye pointed out the Massena production figures, comparing Alcoa preformed armor rod sales and Alcoa armor rod do not reflect industry sales of armor rods. A better comparison would be arrived at if we took orders for 6061 Redraw rod sold to the preformed armor manufacturers and multiply that figure by three. This would give somewhere near the total weight of preformed armor rods being sold. Mr. Dallye reported that several large jobs for tapered rods had been sold this year. Sales seem to be increasing in the large size rods and decreasing in the smaller size rods. Mr. Dallye said that approximately four times as many sets of preformed armor rods are being sold as Alcoa rods. Mr. Lane inquired if there was a possibility of improving the manufacturing process of tapered armor rods. Mr. Coffin and Mr. Dallye explained that the method of making tapered and preformed rods are quite different, but perhaps costs could be reduced.

At this point Mr. Kessler opened the discussion on the

need for bunching equipment at Massena. He stated that a number of different samples of fine wire had been supplied to the General Electric Company for bunching in their Asheboro, N.C. plant, and that the material had been in their hands since August. At the present time a satisfactory date to try out the different materials had not been established. The points in question concern the proper alloy and temper most suitable for bunching. The question as to the most preferable make of buncher was discussed and Mr. Kessler said that he believed the Watson buncher to be the type in general use. However, Mr. Coffin pointed out that the American Insulated Wire Company preferred the Cook buncher. It was reported that most of the trouble the American Insulated Wire Company had with Watson buncher was that the Watson buncher was in [fol. 5254] poor repair. Mr. Kessler stressed the need for accelerating the program with General Electric in order that we may evaluate what alloy and temper are best suited for lamp cord. Mr. Kessler expressed the opinion that it would be well to have the recommendation of the Subcommittee as to the need for bunching equipment so it could be mentioned in the R for A. Mr. Lane said that more facts should be presented concerning return on the investment of the buncher, such as supplying the company's own need for bunched wire, which is now purchased from outside sources. Mr. Coffin recalled that one of the manufacturers had offered to install a buncher on a free trial basis. However, it is unknown whether this offer is still open.

Mr. Cope raised the question if any progress is being made toward supplying American Insulated Wire Company with fine wire for bunching. Mr. Kessler explained that for American Insulated to bunch wire they require wire wound on forty-four of their own special spools. It is believed that until the G. E. trial has indicated the best alloy and temper it would be better to hold off on American. Mr. Cope said that American had offered to bunch some .006 wire if we supplied the wire. The opinion was expressed that if G. E. was going to continue to delay bunching operations that perhaps we should supply American with a supply of wire for bunching. Mr. Kessler stated that the problem of making wire was a minor one, the main prob-

lem was making arrangements with American to get their spools.

Supplying the company needs would be one outlet for initial production. The question was raised as to the price of the buncher and Mr. Kessler stated that it would be [fol. 5255] around $15,000 installed. Mr. Coffin expressed the thought that this was probably too high and that someone had reported to him that a buncher could be purchased for $1500. Mr. Kessler stated that the buncher is only a part of the equipment needed to manufacture bunched conductor. Auxiliary equipment is required. Mr. Kessler advised that he would review the quotations they had received after the last E. C. Meeting but that he believed his estimate was quite close. After checking with the Engineering Department Mr. Kessler reported that bunching equipment, exclusive of auxiliaries, costs between $6,000 and $7,000. Mr. Kessler said that additional equipment and installation expenses would run the total costs to approximately $15,000 which is the estimate arrived at by the Engineering Department. This equipment would take care of control wire requirements down to lamp cords. It was pointed out that over $36,000 worth of this type conductor is now purchased outside the company, which could be fabricated by our own works. Mr. Cope remarked that if we could develop a satisfactory method of making lamp cord it would open a tremendous market for aluminum. It would be expected that American Insulated Wire, General Electric, and others, would enter this market. Mr. Kessler stated that approximately 95% of the bunchers that are used today are Watson bunchers. The Cook machine is a very good machine but there are very few on the market. Most of our customers would be using Watson bunchers, which would be an advantage in having this type equipment.

Mr. Hartmann asked for an expression from the Subcommittee on the advisability of taking action on the purchase of a buncher so that when the R for A is prepared, this [fol. 5256] may be so stated. Mr. Tompkins raised the question of manufacturing control type cable with Polyvinyl Chloride covering, for use in company plants. Mr. Gilbert advised that to cover small wire necessitated additional extrusion equipment costing approximately $45,000. A new extruder would also be required to make lamp cord

fixture wire. Mr. Dallye suggested that perhaps it would be better to wail until we found an aluminum alloy that can be successfully bunched. Mr. Coffin suggested that accurate estimates be prepared on the buncher plus other necessary equipment to turn out small insulated wires. It was decided that after the prices were determined Mr. Coffin, Mr. Cope, and other interested parties would get together and decide if the market potentialities justify this expense. Mr. Cope expressed the opinion that he didn't believe our uses of the extruder could be supported on the basis of fine wire and appliance cord. Mr. Grier inquired as to the smallest wire that can now be covered on the existing extruder, and Mr. Gilbert replied that #6 solid is the smallest size. Mr. Grier said that additional sizes that Alcoa buys, which could be made on the new extruder, in addition to No. 6, would be 8, 10 and 12 size wire. It was agreed, after questions by Mr. Welty, that the present price of copper makes the entrance of aluminum into the appliance cord field at this time economically infeasible. Mr. Kessler stressed that the program right now is to determine the proper alloy and temper so that the finished product will have the proper flexibility and will stand the stranding and other operations. Mr. Tompkins inquired if the surface treatment of bunched conductor is being investigated, and the answer was that it is.

IV. Electrical Uses of Aluminum in Alcoa Plants

Mr. Grier reported that the use of aluminum covered con- [fol. 5257] ductor in company plants was discussed last year and the general needs outlined for this type of conductor. The bulk of this conductor had been purchased from the U. S. Rubber Company before their covered wire manufacturing facilities were sold to Kaiser last spring. Massena has been in production of covered conductor for about a year. Most of the initial operating problems have been solved. The range of sizes goes from #12 conductor to 1,000,000 cm. Part of the company needs are being supplied by Rome, Okonite, General Cable, and others. Mr. Grier explained he was not satisfied with the source of supply. He reported that the rumor that Alcoa had placed a large order for covered conductor with U. S. Rubber, since this company was taken over by Kaiser, is untrue. Alcoa

did buy some accumulated stocks U. S. Rubber had on hand, with Alcoa aluminum conductor. Mr. Grier expressed the thought that he was looking forward to the time when all the company needs could be filled by Massena, and no orders would have to be placed outside.

Mr. Grier reported that high voltage switches of 23,000 volts class made of aluminum are on order with I. T. E. Circuit Breaker Company. Aluminum has very extensive use in bus work in company plants, and G. E. is turning out considerable aluminum switch gear purchased by Alcoa. Westinghouse has not developed their line to the same extent that G. E. has. Burndy has been the chief supplier of aluminum terminals for covered conductor, and Mr. Grier expressed the hope that we eventually might make all our own terminals. Terminals for small wire were formerly made at Richmond, and are now being turned out by a small independent manufacturing company in Covington, Kentucky. This supplier will eventually replace Burndy. [fol. 5258] Alcoa is now specifying aluminum terminals on transformers.

Mr. Grier reported high voltage cable failures at Davenport recently, where the aluminum shielding tape apparently caused the trouble because of corrosion. Mr. Grier displayed samples of the damaged cable. Sample shielding tape taken from storeroom stock, which had never been energized, was bright on one side and stained on the side next to the insulation. The cable was insulated with an oil base compound with a neoprene jacket. Mr. Coffin reported that before the shielding tape is applied the cable is given a tank test so that it is wet. When the shielding tape was applied that was probably the cause of the water stain. Mr. Grier pointed out that the failure could be caused by a combination of moisture and induced a current in the cable shield. This is a very serious problem and it is open to question whether aluminum shielding tape will be used unless the problem is solved. Mr. Coffin suggested that perhaps an alclad foil will give better service. Mr. Grier stated that if it was only a water stain he is not too worried, but if it is corrosion then it is a cause for real concern. Mr. Engelhart explained that water stain itself is a uniform formation of aluminum oxide, but that in corrosion some metal is removed. In his opinion this is

a case of corrosion, as there are signs of metal being removed. Mr. Gilbert explained that Rome did not use tank testing on shielded cable and for that reason it appears that the water stain theory would not hold up. Mr. Tompkins reported that the one cable that failed was Rome and one was Okonite. It was agreed that these samples of cable should be submitted to ARL at New Kensington for complete examination. Mr. Cope reported that efforts had [fol. 5259] been made to develop a market for aluminum shielding tape, and that it is quite important that this problem be solved. Mr. Cope expressed the opinion that Polyvinyl and Polyethylene insulation would be superior insulation to neoprene, as neoprene is fairly porous, and will admit moisture to the cable. This was confirmed by Mr. Engelhart. The question was raised about an Underwriters' approval of insulated cable made by Alcoa, and if this approval was necessary for use in company plants. Mr. Grier replied that this was the case in the States of Washington and California, where the Underwriters' code is mandatory. Mr. Cope expressed the opinion that we might want to get into this business and that it would be a good idea to make up some samples for tests by Underwriters. The question was raised as to the advisability of Alcoa getting into the business of insulated cable. Mr. Coffin was asked the question if he was considering selling insulated cable and he replied that we are not yet ready to enter into this business, which is totally different from bare conductor marketing.

V. Electrical Users of Aluminum by the Power Engineering Division

Mr. Tompkins reported that about 900,000 lbs of aluminum was being used in the Warrick plant. Aluminum includes all types of conductor, switch boxes, cubicles, conduit and so forth. Mr. Tompkins said that the new compression joint filler, Unoba A2 with tabular alumina, had been used at the Chilhowee project in Tennessee, and was quite successful. Consideration was being given to using some General Cable mineral insulated cable which they have developed. This cable would have aluminum conductor under the new type insulation. If turned out, however, that General Cable was not able to supply this new type

[fol. 5260] cable, and Mr. Grier pointed out that he had had the same experience when General Cable offered to make some for the Trinidad project and then were unable to do so. Mr. Grier said that the total use of aluminum at Warrick is about 6 pounds of aluminum per installed KW. Mr. Coffin recalled that slightly over 5 pounds had been consumed for non-electrical uses, that is, pounds per KW installed capacity. Mr. Tompkins said the figure was about 2,000,000 lbs for mechanical uses exclusive of electrical uses. Mr. Guess called attention to the fact that if we had been able to sell all of the plants in excess of 100 megawatts we would have sold approximately 120,000,000 lbs aluminum in 1956 for steam stations.

VI. Review of Investigation in Alcoa Research Laboratories, Messrs. Hartmann, Engelhart and House

Mr. Hartmann stated that if anyone present had ideas on priorities on any research projects, it would be very helpful if they would present them as the prepared report was reviewed. These projects are all covered in the detailed Progress Report of the Alcoa Research Laboratories, Dated September 3, 1957. [7-C-12].

Mr. Hartmann pointed out that when the scheduled tests [9-10338] on the mechanical properties of busconductor are completed an [9-10466] ARL Technical Paper should be prepared and distributed to bus [7-E-5, 9-10503] conductor users. Mr. Hartmann stated that because of budget requirements extruded and rolled bus are kept separate in the research projects. All the tests of mechanical properties of bus conductor are on "A" priiority.

Next item for discussion was insulated Wire and Cable [7-E-7, 16-204] Mr. House reported that Job Order 16-204 [fol. 5261] had been completed [7-E-7, 16-204] and the other item on the Effects of Short Circuits had a B priority and no work had been done on it. The question was raised if the tests are still desired, and the general consensus was that the 7-E-7 item, "Short Circuits on Terminations of Insulated Wire and Cable", be removed from the Problem List.

Mr. Tompkins asked which of the Scotchlok Connectors [7-E-7, 16-357] are showing up the best. It was stated that the Type M is showing up a little better than the

Type R and that the Burndy KS90 seems to be better than either Scotchlok.

Burndy aluminum compression terminals installed with [16-346] experimental Alcoa dies in the Alcoa Model 60A compressor have been tested. The dies require further modifications for optimum results.

Mr. Bond reported it would still be several months [7-E-8, 16-149] before Job Order No. 16-149 covering the report of Bus Conductors in Stacks will be completed. There was considerable discussion concerning the advisability of having Mr. Lanctot's AIEE Conference Paper on Test of Bus Conductors published, and it was finally decided Mr. Guess would take it up with our publications department in Pittsburgh and that they would [16-324] take the matter up with AIEE and get the necessary reprints made, as there has been a good demand for this paper from customers and other interested parties.

Mr. House reported that a large test involving lap [7-E-8] joints of Bus Conductors has been under way for some time [16-222, 16-351] JO-16-351. Mr. Cope inquired if bus test, Job Order No. 16-222, included the various types [fol. 5262] of silver plating, Rapid Process, Powder Weld process and so forth, and it was stated that these would be included in the present Job Order 16-351. This mainly consists of aluminum-to-copper connections in an effort to develop a satisfactory connection for use in the Alcoa Potrooms. It was reported that the Alcuplate bimetallic wafer interposed between aluminum and copper contact surfaces, or joints with the aluminum silver-plated by the Powder Weld process were giving good results. Aluminum-to-aluminum and copper-to-copper were installed as control joints. All joints using grease type sealers between the aluminum and copper with or without metallic particles are continuing to show increased resistances. There was considerable discussion for the theoretical reasons why copper-to-aluminum joints present the problem not present in aluminum-to-aluminum or copper-to-copper. It was stated that Mr. Fred Keller believes that possibly there is some alloying taking place which causes increasing resistances. Mr. Tompkins expressed doubt, and thought it was merely a difference of coefficients of thermal expansion. Mr. Cope showed particular interest in the aluminum

which had been silver-plated by the Powder Weld process. These joints are performing very satisfactorily. In general, where the surface of the aluminum can be successfully covered, the joint will give good performance. Mr. Tompkins inquired if any tests with No. 2 EC-to-copper were being made. It was reported that they are now on test with the No. 2 EC coated with silver by the Powder Weld process. It was reported also that tin-plating on the copper alone did not give a satisfactory joint, but that tin-plat- [fol. 5263] ing on both copper and aluminum has given satisfactory service. Mr. Hartmann raised the question if the joints using the bimetallic wafer should be continued, and Mr. Tompkins stated that this is being used in apparatus terminal connection at the Warrick steam plant. Mr. Hartmann reported that work was being done in New Kensington on flash-welded bimetallic connections between aluminum and copper.

Mr. Schoeffel reported that the Smelting Division [7-E-8] is considering installing Alcuplate wafers in the aluminum- [16-351] to-copper connections at the St. Lawrence plant. He estimated that over $1,000 per year is being spent per potline in remaking joints. The use of No. 2 EC with copper was discussed and there was considerable discussion concerning aluminum-to-copper joints in potrooms. Mr. Tompkins expressed the opinion that silver-plated aluminum should be tested with copper. Mr. Schoeffel discussed the possibility of silver-plating aluminum bus in potrooms to which copper connections were made. Mr. Cope agreed to work with Mr. Schoeffel on various Powder Weld platings for Potrooms bus connections. It was reported that Handy and Harman of New York now have a silicone silver paint which they claim to be very successful, and that G. E. is very enthusiastic about it. However, considerable doubt was expressed as to the value of this type joint compound.

There was considerable discussion concerning relative [7-E-8, 16-75] creep rates of hard alloy aluminum and copper. It was pointed out that tensile creep tests showed the copper to be quite superior to aluminum alloys. Mr. Hartmann requested that E. C. Lab. data on compressive tests of bus bar stack comparing copper and high-strength [fol. 5264] aluminum alloy be sent in letter form to Mr.

Guess [7-E-8, 16-75] and Mr. George Stickley rather than wait for a formal report.

The "B" priority was assigned to Job Order 16-319, [7-E-8, 16-319] Tests of Potroom Aluminum-to-copper Button Type Anode Bus Connections.

A Job Order No. 16-250 Aluminum Washers of Different [16-250] Diameter and Thickness was removed from the Problem List.

Job Order #16-106, Tests on Sandow Bus was removed [16-106] from the Problem List.

There was considerable discussion concerning the advis- [7-E-8] ability of additional tests on the 8" Extruded Integral Web [16-322] Bus with holes spaced at distances greater than 6". Mr. Guess reported that considerable integral web channel bus with holes drilled on 12" centers had been sold and is operating quite satisfactorily. It was decided to schedule no more tests on integral web bus at the E. C. Lab.

It was agreed that Mr. Engelhart would give Mr. Kessler [7-E-9a] a list of Massena-produced Polyethylene covered conductor [XE-157] for corrosion tests at New Kensington. It was decided to leave the tests of soldered and mechanical electrical connections and new floodlight circuit at New Kensington under test.

Mr. Coffin raised the question if the test for aluminized steel core wire had been put up to the ASTM for inclusion in [7-G-1] their Standards. Mr. Kessler advised that Messrs. H. H. Rodee [PK-20] and E. J. Holcomb are on this committee and Mr. Coffin agreed he would check with them.

It was decided to reexamine the present status of the [7-G-1] use of stainless steel core wire in ACSR and investigate any [XE-11] possible new types of stainless steel which may be available for core wire.

[fol. 5265] It was decided to discontinue corrosion exposure test [7-G-1] work on electrical conductor wire made from tilt mold ingot [XE-12] and the problem was removed from the Problem List.

It was decided to continue the test XE-17 of elec- [XE-17] trical conductor containing Boron.

Mr. Dallye reported that a meeting is scheduled for the 19th of September in Pittsburgh to be attended by inter-

[XE-154] ested parties to discuss the possibilities of securing Unoba #2 instead of Unoba A2. Recent tests using compound made with No. A2 have revealed that there is considerable bleeding of thin oil from the compound under pressure, which is undesirable. Mr. Turner agreed to find out if Unoba #2, as originally manufactured, is available on the West Coast.

It was decided that the program on filler twine tests [XE-184] for Expanded ACSR would be discontinued for the present. Mr. Phillips reported that the filler now being used is apparently as good a product as we can obtain, and it was decided there would be no further work at present, but to keep on the lookout for any improved paper filler product. Mr. Dallye requested, and Mr. Hartmann agreed to exert efforts to have the word "Lub- [7-G-3] ricant" removed for protective coatings for ACSR products, as lubricating qualities are not of importance, and the protective properties are what are required.

Recent developments in the use of X-ray for the detection of strand failure was discussed. It was pointed out [7-G-4a.1, 16-203] that Mr. C. W. Cline, Physical Metallurgy Division, is actively following this in search of suitable equipment for use in the E. C. Lab.

[fol. 5266] It was decided to leave the 1000 ft spans of 397,500 [7-G-4a.1] cm with various grease protective coatings throughout the [16-199] coming winter to gather data concerning self-damping characteristics. After that the program will be discontinued.

There was considerable discussion concerning the best [7-G-4a.1] use to put our test data comparing the Alcoa armor rods with [16-159] preformed armor rods and reduction of vibration. It was pointed out that comparative test data with Alcoa products and preformed rods could not be published in such magazines as "Electrical World" but that this information had been effectively used for our sales forces in combatting preformed propaganda.

It was decided to change Job Order No. 16-108 to read [16-108] "Development of Dampers for Structural Members". The work would also be applicable for lamp standards. The meeting was recessed at 6.00 p.m.

The meeting was reopened at 8.15 a.m. September 12, with a discussion of the vibration problem, and it was de-

cided instead of using the expression "P/P max" to refer to this [7-G-4a.3, 16-97] as "damping efficiency". It was announced that Technical Paper #13, covering the vibration problem, is now in the hands of the printer after acceptance by the Alcoa Editorial Committee, as is also a short paper on the Application of Stockbridge Dampers, which was presented to the Poles, Towers and Conductor Subcommittee at the AIEE Summer Meeting at Montreal. Mr. Hartmann reported that the publications department wishes to combine these two Technical Papers, but that he advised them that this was inadvisable, as they were two [fol. 5267] separate publications and should not be combined or even put in similar bindings. Mr. Tompkins expressed the opinion that efforts should be made to get popular articles published in "Electrical World". It was reported that our negotiations with them in the past had been most unsatisfactory, as they wished to rewrite papers to [16-97] suit themselves, which is considered undesirable. It was pointed out that the early work that was done by Alcoa on vibration had not been exploited as much as it should. Mr. Hartmann advised that this is now under study. There was considerable discussion concerning the merits of tapered armor rods and preformed armor rods and straight rods. It was agreed that power input curves of straight armor rods over Drake conductor would be run in the indoor lab to supplement previous data on preformed rods and Alcoa tapered rods.

Mr. Rawlins reported that the analog computer work in connection with the design of new dampers has progressed very satisfactorily. There was considerable discussion concerning [16-97] the material used in damper cables and the advisability of using aluminized steel wire, or combination of steel wires and aluminum; it was pointed out that aluminized core wire is superior to galvanized core wire because of resistance to corrosion. [7-G-4a.3] It was decided that the main effort should be exerted along [16-237] the line of improved damper performance and some work should be done toward the investigation of the use of aluminized core wire for damper cables. It was decided to experiment with the 10 lb damper, using aluminized steel core wire.

Mr. Dallye reviewed the deterioration of dampers sup-

plied to a customer because of rusting of cadmium plated parts. [16-364] Mr. Englehart remarked that vinyl base [fol. 5268] paints were not satisfactory for the type of test being run in the high humidity [16-364] cabinet. Mr. Dallye advised that he would check with Mr. Ray at ARL to see if they could not secure an improved type paint.

Mr. Phillips reported that radio influence work at [7-G-5] Leadville, Colorado, is under way and that the last six months had been spent in instrument calibration, no actual tests have been run yet.

It was reported that the new type tubular compression [16-297] sleeves for large diameter ACSR eliminate the use of spheres at the end of this sleeve to prevent radio interference, which is considered a great improvement over th old cast connector.

It was reported that as the result of a great deal of work both analytical and experimental, it is now possible to [7-G-5] compute a-c resistance and reactance of any type stranding [16-276] of ACSR within 1% accuracy. It was reported that three companion AIEE Papers will be presented at the AIEE Winter Meeting [16-334, 16-318, 16-330] covering "Magnetic Effects of ACSR Core Wire", "Computation of a-c Resistance and Reactance of ACSR" and "Current-Carrying Capacity of ACSR". It was emphasized that it would be quite important to follow these AIEE Papers up with the Alcoa publications on "Electrical Characteristics of ACSR". It was pointed out that personal contact with the Editorial Committee is helpful in expediting the review of Technical Papers and arriving at a constructive solution to questionable points in Technical Papers to be released for publication.

There was discussion concerning the damping of long [7-G-4.a] river crossing spans at high tension on the West [fol. 5269] Coast. Recent tests at Massena with two dampers at the third points, and other tests with festoons were reported. It was decided as soon as complete test data are available on the model span at the indoor test span that the information be passed on to P. G. and E. It was reported that in efforts to damp small conductors Alcoa armor rods have proved to be a better damping device than any festoon tried so far. It was reported that we are in

the process of securing new type preformed festoon type dampers which we plan to test.

It was reported that artifical galloping has been excited [7-G-4a.3] at the outdoor test span, obtaining amplitudes of 3 to 4 [16-294] feet, using a torsional tuning bar on the span having neoprene air foils.

It was recommended that a short article reporting the [JO-16-318] solar absorption test be worked out for publicity along this [16-330] line.

The emissivity test work at Purdue is now progressing [7-G-5] and it is expected this work will be complete this year. [16-274]

It was recommended that the tensile tests on conductors [7-G-5] annealed to various degrees at Purdue University be run by the [16-160] P. T. Lab. as soon as practical and a final report on the work issued.

It was decided that PVC covered Triplex should be [7-G-5] tested in addition to the other samples on the 300 amperes [16-345] failure to destruction tests now in progress.

It was decided to give A-Plus priority to Job Order [7-G-6] 16-291 covering tensile creep tests, stranded aluminum conductor [16-291] at elevated temperatures.

Job Order 16-340 should be known as "Exposure Tests [fol. 5270] [7-G-6] of Conductor at Jenner Test Site, Pacific Gas and Electric [16-340] Company" instead of "Test Site Near Bodega Bay".

The question was raised as to the amount of good [7-G-6] Alcca would derive from Cold Room Icing Tests of Stranded [16-355] Conductor run at the Cleveland cold room. The consensus was that in addition to the customer good-will it would possibly lead to other advantages for Alcoa.

Mr. Dallye reported that samples of Unoba A2 and [7-H-2] Tabular Alumina Filler Compound was being used by some [16-344] customers and company plants. However, a better product is still being searched for. This has had a very good acceptance and is greatly superior to zinc chromate.

Mr. Dallye stressed that it is important to find a more [7-H-2] uniform and satisfactory method of scratch-brushing grooves [16-356, 16-359] in p. g. clamps. Con-

siderable numbers of clamps have been returned from our customers because of poor contact resistance. Mr. Guess stated that any specific recommendation for scratch-brushing for both hand and power type brushes should be available to pass on to customers when requested. Mr. Kessler agreed to work out recommendations on the proper brushes to use for both hand and power applications. This information would be reviewed with the E. C. Laboratory before it was forwarded to Mr. Guess. The relative merits of cleaning by scratch-brushing versus chemical cleaning of p. g. clamps was discussed. Mr. Kessler stated that it was purely an economic problem as to which process is best, as both methods can produce satisfactory results if properly used.

Mr. Kessler advised that 50% zinc and 50% tin solder [fol. 5271] is to be used in place of lead-tin solder in the production of copper bushed p. g. clamps. It was expected some savings will result.

It was agreed that on Job Order XE-249, Alcoa #2 [7-H-4, XE-249] Electrical Joint Compound Test should include a corrosion test to study the effect of Alcoa #2 Joint Compound on silver-plating. Mr. Cope agreed to look up the letter concerning this subject which gives the full requirements. Mr. Dallye reported that he had a test report made by Alcan on various joint compounds which he would have copied and sent to various interested parties. Mr. Dallye stressed the fact that we are still looking for a joint compound better than #2 Electrical Joint Compound. Mr. Dallye pointed out that in the wording of Item 7H5, the [7-H-5] word "Lubricant" should be changed to "Sealing and Filler Compounds for Conductor and Accessories". The word "Lubricant" is very misleading as it is not a lubricant that is needed.

Mr. Dallye stressed the need for short-circuit tests on parallel groove clamps. Also data are needed concerning the effect of conductor tension on bolt torque and contact pressure. The effect of different lubricants on bolt torque and pressure should be investigated more fully.

Mr. Engelhart raised the question as to the advisability of a research program on wiring harness under various conditions of corrosion. Such a program would take about five years. It was agreed by the committee that the Sales

Development Division would handle this when the need for such work arises. Mr. Engelhart also raised the question concerning underground corrosion of aluminum grids used in grounding systems. It was the consensus of the [fol. 5272] Subcommittee that it is not particularly interested in this project. This problem should also be reviewed by sales development and also any other interested parties. It was the consensus that work should be done on soil corrosion of insulated aluminum conductor for direct burial in the ground.

VII. Review of Investigations at Massena Works

Mr. Kessler called attention to his letter dated August 31, 1957. Mr. Kessler reported on the work to develop a high strength alloy for all-aluminum stranded conductor. A smooth body conductor constructed of five strands of 3004-H18 Wire with two EC-H19 strands could be produced at a cost of 15% to 20% above equivalent ACSR. Some experimenting had been done on 2 EC + .25% copper in a T81. The production trial is nearing completion. However, it is expected this will cost approximately 30% over ACSR. It was recalled that the goal for this type conductor would be perhaps 10% above ACSR in price, and have a conductivity of 56% with a tensile strength of 40,000 to 45,000 psi. Best results so far in conductivity are around 53%.

Recent advertisements by both Kaiser and Reynolds concerning high-strength all-aluminum conductor were discussed. Mr. Kessler emphasized that the Reynolds products using 5005 alloy cannot possibly result in a conductor anywhere near the equivalent strength of ACSR, size for size. It was agreed that a strong alloy conductor having the strength of about 10% less than equivalent size ACSR and about 15% maximum price increase over ACSR would have possibilities and that the efforts would be exerted to find such a product. The possibility of stranding com- [fol. 5273] binations of 2 EC-T81 with EC-H19 will be investigated by Mr. Kessler and Mr. Coffin.

Smooth body Stranded Conductor was discussed at length. Mr. Guess pointed out that because of the current price war this product had not been pushed. It was emphasized that the increased cost of this product over stand-

ard conductor would eliminate it as it appeared that a premium price cannot be realized on this type conductor. It was the opinion that smooth body has a real field in covered conductor because of the consequent saving on covering material and also the saving of space. However, this depends on holding the cost down to that of standard stranded conductor. It was decided that Mr. Kessler and his group would study the problem further, and if such conductor can be made on a proper cost basis it will be introduced to the market at a proper time, when prices have become stabilized.

The Identification of Massena Stranded Conductor by means of Panniers 127-½ red marking ink was discussed. Mr. Turner pointed out that this ink will bleed through into any protective grease that may be applied to the conductor for protective purposes. Mr. Turner advised that Southern California Edison had requested that conductor manufactured for them be identified by an orange color paint, and after considerable investigation by paint manufacturers and ARL at New Kensington, a lead-free orange paint had been successfully applied and that this paint will not bleed through Calol White Grease No. 2 which is standard protective grease used by Southern California Edison Company. It was agreed by the Subcommittee that this entire subject should be reopened and that Mr. Turner should send samples of painted wire to Mr. Engelhart [fol. 5274] for examination and that the Product Identification Subcommittee should be informed of the findings.

It was reported by Mr. Kessler that recent attempts to improve the quality of ACSW had been unsuccessful and the question was raised if this problem should be further pursued, in that the Bell Telephone people no longer contemplate the use of ACSF for open wire telephone circuits, as they are now using an aerial type cable using aluminum communication wire insulated with Polyethylene in pairs carried by a steel messenger. Mr. Guess commented that the railroads and telegraph companies are still interested in the product. Mr. Coffin reported that he had received information from two different sources to the effect that Copper-Weld now has an aluminum-clad steel wire similar to Copper-Weld which they are just about ready to introduce to the market. Mr. Coffin pointed out

that it might be of considerable advantage to Alcoa to secure a patent license for the process Copper-Weld is using for the manufacture of this product. The possibility of an all-out program to develop the process at ARL New Kensington was discussed. It was estimated the first year's work would amount to $25,000 and may continue through three years with no guarantee of success. In light of the possibility of Copper-Weld already having a process worked out it was agreed that no further work on this problem should be done at the present and that Mr. Coffin would initiate negotiations through suitable channels to explore possibilities of securing a license from Copper-Weld. Mr. Hartmann stated that he would advise, in light of the present situation, the Process Metallurgy Divi-[fol. 5275] sion not to put an item in their budget for Research on ACSW and that if the situation changed, it will be put in as a special item later. Mr. Kessler reported that Triplex with ACSW Neutral had very poor customer acceptance and had been used by one company outside of Alcoa, the Nantahala Power & Light Company. It was decided that no indoor test span space should be used for testing fatigue characteristics of ACSW but some should be installed at the outdoor test span for natural vibration tests.

Mr. Kessler reported that the production of the 62% minimum conductivity EC was moving along, but that there were considerable quantities of old stock. Mr. King reported that this project was also coming along well at Vancouver. It was pointed out that in light of this higher minimum conductivity conductor that the precision of conductivity measurements should be closely checked and that samples from Vancouver and Massena be sent to the E. C. Laboratory for additional checking on the Kelvin Precision Bridge. It was pointed out by Mr. Hartmann that the conductivity measurements had never been placed under the type of control that mechanical testing and chemical analysis had been, and perhaps in light of this new development the matter should be looked into to set up a regular program for conductivity tests and checking. Conductivity samples should also be sent to Mr. House for test from both Vancouver and Massena.

Mr. Turner reported that the Kaiser people on the west

coast were already aware of the fact that we had sold A.G. & E. some 62% minimum conductivity conductor. It was the recommendation of the committee that Mr. Coffin take steps to set up a meeting in Pittsburgh for interested [fol. 5276] parties to study the introduction of 62% minimum conductivity EC Wire to the market, which would include exploration of the possibility of placing a small premium price on 62% minimum conductivity wire of ¼ cent.

VIII. Miscellaneous Items

It was emphasized that the work of the Subcommittee on Electrical Conductors includes electrical conductors and accessories which should cover the full scope of conductors as well as overhead transmission circuits. One exception to this is the work on the foil coil project which is being followed by the Capacitor Foil Committee.

The Armour Research Foundation proposal that Alcoa sponsor a continuation of their research work on aluminum connectors was considered by the Subcommittee. This program was originally initiated by the Edison Electric Institute and upon completion the sum of $70,000 will have been expended. EEI have decided to terminate the program when the present funds are exhausted. Accordingly, Armour approached Alcoa as an exclusive sponsor for the continuation of the program. The first year's work would entail an expense of $30,000. After considerable discussion the Subcommittee recommended that the program should not be pursued by Alcoa and Mr. House was delegated to write Dr. Colnar of the Armour Research Foundation advising him of the Subcommittee's action.

Recrystallization temperature and creep rate of aluminum conductor was discussed. Mr. Bossert has already advised Armour that we would think about the project and [fol. 5277] that if we decided to go into it we would let them know so that so further reply to Armour is in order. After considerable discussion it was agreed not to go into this program, but to conduct a modest investigation of our own, which was reported to be already under way, using 12 ft lengths of wire which had been flexed and straightened. These will be checked for creep rate and the effects of flexing on the temperature of recrystallization.

Advertising programs on stranded conductors being car-

ried out by one of our competitors was discussed. It was pointed out that these advertisements do not include cost in their claims of efficiency of transmission and other advantages. However, it was agreed no counter-moves concerning these advertisements should be taken, and it was pointed out that misleading advertisements usually boomerang.

Mr. Cope advised the Subcommittee of a request made by the Square D Electric Company, through our Detroit Sales Office, to conduct test on aluminum fittings manufactured by their company. It was pointed out that similar requests of this nature had been turned down in the past, and that we should not become involved in commercial testing. It was decided by the Subcommittee that Mr. Cope should advise Mr. Wooldridge of our Detroit office that we are not in a position to undertake these tests for Square D.

The manufacture of a special type ACSR which is hoped to have self-damping characteristics was discussed. Confidential negotiations have been carried on with Okonite and they have agreed to make covered strands which would be part of the 795 MCM ACSR 26/7. The Subcommittee agreed that this project should be pursued in an effort to develop this new type conductor.

[fol. 5278] An experimental type damper designed by Mr. W. E. Michalke was discussed and it was decided to advise Mr. Michalke that based on information already available it appeared doubtful that this type damper would be effective.

Investigation covering welding of electrical conductors was discussed. It was reported that present specifications are the same as those used for welded pressure vessels and are quite unrealistic for welding electrical conductors. Mr. Cope agreed to get a group together to discuss this which would include Mr. Guess, Mr. Sandell and Mr. Wagner, to see if a satisfactory specification for welding electrical conductors could be drawn up. Mr. Hoglund and Mr. Rogerson would also be included in the group. Mr. Kessler suggested that the results of this committee be submitted to the ASTM committee B2. It could be made a part of the section known as "Specifications for Aluminum Bus" Committee B2 ASTM. Mr. Grier emphasized the

need for an acceptable specification for welded bus which could be used by consulting engineers. The only code available now is the ASME test code for pressure vessels, which is entirely too severe for this application of welding.

The question of getting out a report on Chemical Cleaning for Weathered ACSR was brought up. It was stated that so far a satisfactory method of chemical cleaning had not been arrived at, although one was still desirable. Mr. Coffin expressed the opinion that he did not think it advisable to circulate information on the method developed because of the fume and safety angle and also the fact that [fol. 5279] it did not do a very good job on the inner layers of the conductor. Apparently at this time scratch-brushing is still the best method of cleaning.

The question was raised concerning publicity on the tests of the DuPont explosive type joint. It was stated that DuPont is not interested in publicity on this process at this time and Mr. Coffin expressed the opinion that he thought any publicity should be up to DuPont if and when they are ready.

IX. New Projects

Under new projects Mr. Guess stated that information concerning the relative effect of creep on Polyethylene, Neoprene and PVC covering for aluminum conductors would be helpful. It is pretty well established that PVC is quite susceptible and appreciably deteriorates on conductor strung under tension. Many customers have found this out for themselves and consequently refused to use either Neoprene or PVC covered Triplex claiming that the neutral would cut into the covering, causing failure. Various possible tests of this type were discussed. Mr. Hartmann suggested that Mr. Guess draw up a brief outline of what information he required as a sales aid so that a possible test program could be arranged.

Mr. House reported that Mr. Rawlins had been invited to give a talk on conductor vibration before the Alabama Section of the AIEE next March and that he expected to give the same talk before the New York section of the AIEE this coming December. Clearance to give these talks has been obtained from the Editorial Committee.

The possibility of Technical Papers on the Sleet Melt-

[fol. 5280] ing Tests carried out at Massena was discussed and it was agreed that such paper should be prepared as soon as posible for presentation to the AIEE. It was agreed also that a paper on the Conductor Icing Tests at Cleveland should be prepared as soon as practicable.

X. Budget

Mr. Hartmann presented a sheet showing the consolidated Budget items for all research on electrical conductors. This covered work by the Physical Testing Division, the Lubricants Division, the Chemical Metallurgy Division and the Electrical Engineering Division at Massena. Engineering Design Division should also be included. The budget was discussed at length; Mr. Dallye pointed out that there is still work in accessories that he would like to have done, namely, the short circuit tests on parallel groove clamps, tests on 356 alloy scratch-brushed and unscratch-brushed should be done. Mr. Kessler made the remark that he did not believe consistent results could be obtained on F castings without scratch-brushing. Mr. Hartmann asked for an expression from the Subcommittee if they considered that the budget was satisfactory for 1958 operation. Mr. Grier made the motion that the budget be accepted in its entirety and this was seconded by Mr. Coffin and unanimously carried by the Subcommittee. Mr Hartmann stressed the point that it was the purpose of the research program to work on the problems which would bring Alcoa the most return and prestige, and that any suggestions from the members of the Subcommitte would be most welcome. Mr. Coffin stated that one particular project in which he was interested in getting on a commercial basis was the use of M475 alloy conductor.
[fol. 5281] Mr. Coffiffin referred to contacts that he has in the Hawaiian Islands. It was agreed he would investigate the possibility of erecting some M475 stranded conductor in the Hawaiian Islands, where the corrosive conditions are among the worst in the world.

Portland Office

Re: Electrical Conductor—Covered

We have for some time been in a negative sales position with respect to covered and insulated electrical conductors. Relying on others for mfg. of material and latterly putting in limited facilities of our own, we have yet to convince the customers Alcoa is firmly in the business and will make technical contributions to the industry. Kaiser's purchase of U. S. Rubber's Wire and Cable division only accentuates our position and will in the future, I believe, place us in severe jeopardy of a proper share of the aluminum cable market.

The announced plans to rectify this condition consist of a three stage growth in Alcoa facilities, beginning with a polyethylene line at Massena, a neoprene line at Massena and another polyethylene line at a location to be determined. Barring an acquisition of another company's facilities, there is reason to believe the plan should now be altered to include a polyethylene line at the Vancouver plant as the next step. I believe we should support this view and suggest we work closely with the Vancouver plant on the problem.

Last spring a study was made of the economics of Massena shipments v.s. Vancouver shipments of poly-thylene covered conductors to the territories of Seattle, Spokane, Portland, San Francisco, Los Angeles, Kansas City, Denver, Omaha, Wichita offices, as well as the El Paso area. Using 1956 booking figures and the freight savings on pig and ingot shipments east and finished product west, the net savings to the company of a Vancouver installation

[fol. 5283] were approx. $7,000/year. This, however, did not amount to 20% on an investment of $130,000. It appeared an additional 160,000 lbs. of West Coast aluminum weight business on top of the 400,000 lb. total would be required to reach this goal.

A recent cursory review of 1957 business seems to indicate a more favorable position to the proposition. Massena is running a full three-shift operation of which one shift is for West Coast destination. Since accommodation of further increases in polyethylene business will require additional facilities, West Coast bookings and shipments are up 50% in spite of a San Francisco decrease, and the change in the Los Angeles area to polyethylene has yet to take place, it would seem logical we should support a West Coast facility before further development at Massena.

Certainly we have a stake in a Vancouver operation. Even though Seattle district shipments of covered wire reflect the majority of the West Coast increase in business, a mill here would definitely generate further income for us. COPCO, now no factor in our covered business, would support the mill and I am sure P.G.E. and PP&L would of necessity enlarge on our share of their market.

I feel it will be to our own best interest to promote and aid Vancouver in the R for A currently being prepared.

Mr. P. T. Coffin, Pittsburgh Office.

Re: Electrical Conductor Sales Meeting, December 9, 10, 11, 1957

Our main interest is the competitive price situation in bare and covered conductors. Things are temporarily quiet but none of us are naive enough to believe the trouble is over. We have gone through the worst price war we have ever experienced. Did the percentages of the market obtained by Alcoa and our competitors change, or did our relative positions stay the same? Have our competitors been convinced that we all can get full-profit price and still obtain the same percentage of business? We hope it is not necessary to repeat this costly solution.

We seem to detect the feeling that most of our Utility customers would pay full price if the major conductor suppliers would hold firm. This probably is wishful thinking on our part, but we are wondering if other districts detect any of this feeling. We have noticed an encouraging sign. Southern Electrical Corporation seems to be holding to the price schedule since Olin-Mathieson bought them.

You know the situation that developed at General Electric, D.A.D., Cincinnati. We started at a price of $.84/lb on flattened wire bus conductor cut to ten foot lengths. After numerous discussions about price with the customer, they decided to get competitive prices. This resulted in Alcoa having to cut the price to $.45/lb to keep the business. It was difficult to convince General Electric that we were not gouging them at the start. I believe we [fol. 5285] should review our costs and selling prices on our products so we do not appear excessive when compared to our competitors.

What is the competitive picture on extruded bus conductor? General Electric now has a lower price on extruded bus from an independent extruder. We are trying to con-

vince them our quality control on such things as electrical conductivity and tensile properties makes our product worth more. The customer, however, is extremely price conscious.

What is Alcoa doing to expand its activities in the Electrical Conductor Industry? Are we going into the insulated wire, building wire, and other conductor applications? It seems that Alcoa cannot continue as leader in aluminum conductor if we do not produce some of those other conductors. It is disturbing to see Kaiser expand into all conductor applications and threaten to take over first place.

We have one customer showing interest in Reynolds Metals Company's new alloy 5005 conductor. I assume Rodee will have the complete story on that for the meeting. We would like to have samples available to give to customers to keep Reynolds out.

We suggest Dixon Lewis cover the up-to-date Conduit situation. The fact that we are now competitive with steel conduit on an installed basis should result in increased good business.

I am sure we will hear from the Development Division. I would like to have the latest information on silver plating aluminum. I notice Reynolds Metals Company is making some claims.

Re: Facilities for Neoprene and Rubber

Please accept my apologies for breaking into your meeting on Friday. Had I known ahead of time that my vacation schedule would permit me to stop off in the Alcoa Building, I could have made arrangements ahead of time to see you and L. T. We are naturally very much interested in your reactions to my letter of August 8, and I am glad you questioned my opinion that we do not need a high-priced rubber chemist to produce neoprene and rubber products.

This statement reflects our immediate thinking on producing the standard neoprene line wire and triplex items that we now obtain from Rome Cable, as well as the two-shot rubber-neoprene triplex. I see no reason why we cannot handle the technical problems of these products.

As far as the broad problem of development of new products is concerned, we certainly agree that an experienced technical person is called for. Without such a person, we would, as you intimated, just be following behind our competitors. We all agree that Alcoa would not want to be in such a position.

However, we believe that such a person, with the department and facilities that must ultimately come, should be a part of Alcoa Research Laboratories and not a member of our fabricating organization at Massena. If we hope

to compete development-wise with Rome Cable and the like, we will no doubt need research and development facilities approaching those that we have seen at Rome.

[fol. 5287] To sum up our position, we can undertake the manufacture of our present standard neoprene product without the benefit of an experienced technical man. To go further into the development of new products would require, as you stated, a technical body of appropriate background, size and facilities.

Confidential

Minutes of Fall Meeting

Subcommittee on Electrical Conductors Massena, New York, September 10-11, 1958

The following detailed reports were submitted by members of the committee prior to the meeting.

Conductor Accessories—F. R. Dallye, Sept. 3, 1958.
Electrical Windings—R. R. Cope and S. R. Chapman, July 10, August 20, 1958.
Development and New Applications—S. R. Chapman, Sept. 9, 1958.
Massena Production Data—C. L. Kessler, August 25, 1958.

Massena Fabricating Works Development—C. L. Kessler, August 26, 1958.

Alcoa Research Laboratories—Progress Report—E. C. Hartmann, Sept. 4, 1958.

The minutes do not include the detailed information given in the above reports. Only matters discussed during the meeting are included herein.

Members Present

Mr. E. C. Hartmann, Chairman, Mr. S. R. Chapman, Mr. P. T. Coffin, Mr. F. R. Dallye, Mr. L. T. Guess, Mr. H. E. House, Mr. W. E. King, Mr. C. L. Kessler, Mr. N. B. Lane, Mr. J. S. Tompkins, Mr. R. N. Wagner.

Guests

Mr. L. M. Arbegast, Mr. E. T. Englehart, Mr. L. C. Getsinger, Mr. T. L. Gilbert, Mr. R. W. Knapp, Mr. E. K. Lanctot, Mr. C. B. Rawlins, Mr. T. E. Simpkins, Mr. W. D. Stewart, Mr. C. B. Travis, Mr. O. F. Turner, Mr. P. D. Tuttle, Mr. Y. C. Yedlicka.

[fol. 5289] Mr. Hartman called the meeting to order at 10:30 A.M. on September 10. All members were present. Mr. Hartmann welcomed two now members, Mr. Wagner and Mr. Chapman, also Mr. Otto Turner who was representing Vancouver. It was the wish of the Vancouver management that they be represented informally on the committee, without any regular membership.

I. Market Conditions and the Competitive Situation

Mr. Coffin reported that market conditions at present show a very mixed trend. Apparently little business has been placed with our competitors since June 13, when Alcoa went back on price schedule in an effort to end the price war. Most competitors, except two or three small ones, have held to this price schedule. Mr. Coffin reported most of the conductor business had gone to Alcoa, which would be good if it weren't for the fact that to keep their mills going, competitors may cut prices. There are several million pounds on our books and it is hoped that most of this

can be shipped before any further price cutting. Mr. Coffin expressed pleasure with the prestige and good salesmanship of Alcoa. Price cutting in the past has resulted in a general depression of prices as it has been Alcoa's practice to meet these prices, consequently it does not result in any increased business for competitors, but just make profits poorer for all. The present outlook is that the 1959 business level in conductor will be as good as 1958.

Mr. Lane asked if we were bothered by foreign manufacturers in our domestic market. Mr. Coffin replied that because of the tariff barrier this was not a problem. However, it is practically impossible for us to get any foreign business because of their low price schedules. Government subsidies in Sweden enable them to cut prices drastically. [fol. 5290] Combined shipments from Vancouver and Massena during July were the heaviest in 4 years. August and September also look good. The Covered Conductor Department at Massena had the best month in August that they have had since they began production. In spite of vicious price cutting, Massena has been able to show a profit on covered conductor. A profit has also been shown in expanded conductors. Mr. Coffin reported on the tie-line between Commonwealth Edison of Chicago and Indiana Michigan, a subsidiary of American Electric Power Corp.

Mr. Coffin reported that Kaiser is having almost identical trouble with popped strands that Alcoa had with Bonneville. Considerable mileage of Kaiser conductor will have to be replaced. As pointed out, most of Alcoa's trouble with Bonneville was caused by the contractor, whereas the contractors on the Chicago-A.E.P. Corp. tie line were two of the most experienced in the U.S. It is understood that 200 miles of 159 MCM ground wire will have to be replaced by Kaiser because of aluminum strand failures caused by very short length of lay of steel core. Because of these troubles Kaiser is presently somewhat fed up on the conductor business.

Mr. Coffin reported that after years of negotiating and studying, a transmission line with all-aluminum towers is about to become a reality. Negotiations are underway with Public Service Electric and Gas of N.J. The only other line with all-aluminum structures known at this time is the Kitimat line in British Columbia.

Mr. Lane said that he wished to go on record that Massena be given a chance to figure on furnishing the transmission tower structural shapes. He believed Massena can compete price-wise, both for company-use shapes and [fol. 5291] customer-use shapes. In all probability the shapes could be cut to size and punched at Massena, and delivered to the job-site at a price as low as extrusions. Mr. Lane reported that Massena definitely needed the structural business, as they were down to 2 to 4 shifts on the 26" mill, whereas some of the extrusion plants were on 20 shifts.

Mr. Coffin pointed out that Commonwealth Edison of Chicago and Philadelphia Electric Company are interested in aluminum structures. Sales Development has shown that aluminum towers weighing about 40% of steel are adequate and can be profitably sold at 50¢/lb. Galvanized steel towers require painting after 1 year in heavy industrial areas such as New Jersey, and after, at most, 3 years in other locations. Painting costs vary from $600 to $1200 per tower, and of course it is necessary to deenergize the line.

Mr. Coffin reported that the Copperweld Steel Co. had made contracts with Alcoa and Anaconda to join Copperweld as the sole outlets of Alumoweld wire. Mr. Coffin believes that the biggest outlet for Alumoweld wire will be the neutral for triplex. Alcoa has an exclusive contract to supply the aluminum powder for making Alumoweld. It was reported that interest in the Alumoweld product had been shown by Aluminum Development Assoc. in London. Their request for test data and samples will be forwarded to Mr. Coffin.

Mr. Hartmann called attention to Mr. Dallye's letter of Sept. 3, commenting on accessories for aluminum conductors. Mr. Dallye elaborated on the EEI standardization work on compression fittings. A number of manufacturers have complained about the cost of this test program. The initial stage will be on 4 sizes which will involve about 760 tests of various combinations of 6 manufacturers' fittings used with each other manufacturers' [fol. 5292] tools, etc. The main question is finding a suitable laboratory for doing this work. Mr. Dallye has contacted the Detroit Edison Co., who have equipment and

manpower for the work. There is also the possibility that some of this work could be done at our Vancouver Works, as Mr. Turner advised that their testing machine is not very busy. It was agreed that Mr. Turner would look into the probable costs of running these tests at Vancouver, on the basis of making a modest profit. There are no known commercial laboratories who have the proper type horizontal testing machines to make such tests.

II. Development Trends and New Applications

Mr. Cope called attention to 2 reports prepared for the Electrical Winding Subcommittee, dated July 10 and August 20. An illustrated talk has been presented to educate our own sales people and our customers on the advantages of strip foil windings. Coil designs from about 30 different customers have been received. To date coils for about 6 different customers have been prepared. No. 3 EC having 61.0% minimum conductivity has been designated as the alloy for strip windings.

Mr. Cope reported that Alcoa is now in the magnet wire business. Rea Magnet Wire in Fort Wayne, Indiana, who are the leading independent producers of magnet wire, will make 10 to 24 gage magnet wire for Alcoa which will be insulated for high temperature operation. This will be manufactured by Rea as an Alcoa product, and will be marketed by Rea as Alcoa agents. The price will be about 6 to 14% lower than copper 2 sizes smaller. Mr. Coffin said that Rea's sales force is well known in the magnet wire industry and that they are best suited to sell this product. Perhaps later on they might buy redraw wire rod instead [fol. 5293] of the small wire. In applications where space factor is not of much importance, as in small appliance motors, there may be a good market for aluminum magnet wire.

Mr. Chapman reported a great need for a report on silver-plating for distribution to our sales forces. Present information on silver-plating techniques and thicknesses required are conflicting. Mr. Chapman asked for an expression of policy on silver-plating. Mr. Coffin reported that he had prepared an initial Memorandum on June 6 on this perplexing problem. It was pointed out that G.E. does not use a copper flash and have gotten into no trouble,

whereas our findings show that the copper flash is beneficial. It is appreciated that the commercial angle, the scientific angle and the customer-relation angles are all very important in any Alcoa release. It was agreed that Mr. Coffin would revise his Memorandum in an effort to produce instructions to our sales forces that will give harmonious results.

Mr. Chapman brought up a recent letter in which he indicated the need for Underwriters' approval on unplated aluminum bus. Mr. Wagner reported that Alcoa had sent out a specification some time ago that all our purchases would be unplated aluminum bus. The former specification said that we would accept silver-plated aluminum but would prefer bare. It was decided that the Underwriters' Lab should not be contacted on this subject, and that a requested article for Plating Magazine should not be written at this time, because of a number of unanswered questions.

Mr. Chapman reported that it has been established that copper-plated aluminum wire cannot compete with tin-plated copper unles it can be drawn down after plating. [fol. 5294] Mr. Hartmann reminded the group of the R-168 Process developed some years ago at ARL for solder-covered wire. Further work could be done on this process if justified. Mr. Chapman expressed the opinion that the present low price of copper would not hold up very long and any substantial price increase in copper would make solder-covered aluminum wire competitive. The process used by the Steel Protection and Chemical Co. at present gives only a mechanical bond and will not stand drawing into small wire. Mr. Coffin spoke of the need for higher speed methods of applying the solder coating to aluminum. Mr. King reported on a new type process where the wires form a helix and a mile of wire fits in a 60-ft tank. This process is being further investigated.

Mr. Chapman reported there is considerable interest in copper-plated aluminum for electronic applications. Mr. Chapman exhibited 2 samples of copper-clad aluminum, similar to Alcuplate, made at ARL. It was pointed out that this product has many electrical uses and should be followed up. Mr. King pointed out that one danger of rolling copper-clad aluminum in aluminum rolling mills was copper contamination of other aluminum products.

Aircraft and Marine Products is offering a line of compression connectors for both transmission work and distribution, which will be in direct competition with Alcoa.

III. Production Situation

Mr. Kessler referred to his letter to Mr. E. C. Hartmann of August 25, 1958, reviewing the production situation at Massena Works. Mr. Kessler pointed out that money could be saved if grease was applied only to the outer strands of 19-strand steel core. Mr. Coffin pointed out [Vol. 5295] that about 40 cents a pound is being realized for 22-cents-per-pound grease. Furthermore we must usually apply grease to all layers or not get the order. There was considerable discussion on methods of applying grease to 7 and 19 strand core wires and it was finally decided that this would be discussed between Mr. Kessler and Mr. Turner.

After considerable discussion Mr. Kessler agreed that they would study the advisability of requesting revision of ASTM Specification B-230 for hard drawn aluminum wire for electrical purposes. The proposed method would tighten the specifications and reduce the amount of testing necessary.

The advisability of being able to apply Neoprene insulation to conductors was discussed. Mr. Kessler advised that an investment of approximately $437,000 is required with a period of about 2½ years necessary to return the investment. This proposal had been submitted to Mr. Coffin for study. Mr. Gilbert reported that the Covered Conductor Mill was running 3 shifts now. Consideration is being given to trading in the extruder purchased 2 years ago for a new one which would give 60% more capacity.

Mr. Guess raised the question if we would be interested in taking the order for control cable which could be color coded. Mr. Gilbert advised that we are in the initial stages of placing an order for a buncher and saw no reason why such control cable could not be fabricated. Mr. Guess said Mr. Gunther is very anxious to have a trial run made of control cable. Mr. Guess pointed out the desirability of having test facilities to meet the required specifications. Mr. Kessler was asked to look into the question of con-

ducting adequate tests and will get in touch with Mr. Guess to work out an adequate program.

[fol. 5296] Mr. Kessler pointed out that costs of conductor accessories are being reduced. There was considerable discussion concerning fluctuation of production costs and it was pointed out that there are many variables that affect these figures.

Mr. Lane raised the question if Alcoa had considered the purchase of Belgian core wire which sells for a considerably lower price than domestic products. Mr. Coffin explained this was now in the hands of top management.

Mr. Turner reported that the reason he was requiring additional 84" steel reels from Massena was reels were not being returned but were being held up because of customer right-of-way difficulties and other things beyond his control. There are still 1550 84" steel reels at Massena Works on July 31.

Mr. Coffin reported that the new committee for Wire, Rod and Bar Association had been formed, for which he was appointed temporary chairman, and one of their most important goals is to try to standardize reels. Most of our competitors are represented on this committee and it is hoped that within a year manufacturers will be able to achieve standardization which would, of course, be a saving to both customer and manufacturer. Mr. Lane asked if some of our reels would have to be scrapped. Mr. Coffin said no. Mr. Coffin advised that the eventual goal of this committee would be 2 types of reels, an aluminum reel and a nonreturnable wooden reel. Mr. Turner asked what effect it would have if the customers requested longer lengths of cable. Mr. Coffin replied that Mr. Rodee was working on this problem.

IV. Electrical Uses of Aluminum in Plants

Mr. Wagner reported that the new pot rooms at Massena [fol. 5297] and Warrick had more aluminum than any other potrooms built by Alcoa. The construction program of course has been very much curtailed during the past year, so that not much new equipment is being bought. They are now specifying that switchgear bus not be silverplated. The use of tubular bus instead of flat bus is being investigated. Mr. Wagner said they were interested in the

buncher for Massena, so that our requirements for control cable can be purchased within Alcoa.

Mr. Wagner reported interest in Cadweld. The question of the use of insulated aluminum conduit for use under ground and in highly corrosive chemical plants was discussed and the economy of its use was questioned, although all agreed that the problem should not be dropped. It was agreed that the covering of any conduit should not be undertaken in Massena at present. Mr. Guess reported that some of the newer plastic type conduits are very strong structurally and would be more economical than insulated aluminum conduit. Mr. Guess asked if we could make polyethylene pipe at Massena to cover orders from duPont. It was pointed out that it would not be profitable to tie up the extruder line in Massena and that this pipe would be best farmed out to makers of plastic pipe. Mr. Gilbert pointed out that the competitive situation was quite strong, so that chances of getting a good price are excellent.

V. Electrical Uses of Aluminum by the Power Division

Mr. Tompkins reported that all the silver plating on the apparatus contacts at Warrick is being removed where connection is being made to unplated aluminum conductors. He reported there has been considerable interest by visitors [fol. 5298] to the Warrick Power Plant on the wide use of architectural and structural aluminum. Serious consideration is being given to the use of aluminum towers at the Suriname Power Project. There is also a great deal of aluminum being used in the new St. Lawrence switchyard. Mr. Coffin advised that an attractive brochure of the Warwick Power Plant, telling of all the uses of aluminum, will be released in a few weeks.

VI. Review of Investigations at Massena Works

Mr. Kessler reported requests for 50,000 ft of 5005 No. 4 Conductor. Apparently it can be sold at the same price as equivalent size ACSR. Mr. Tompkins asked about the amount of alloy conductor being sold for overhead transmission lines. Mr. Coffin reported there has been very little 5005 alloy sold and he had been informed that less than a million pounds of Kaiser AAAC were sold since they first

introduced it. He expressed the opinion that when Alumoweld wire is fully developed, we will have a strong conductor far superior to 5005 or AAAC. Mr. Coffin pointed out that tests run in the past on all-aluminum alloy, all-aluminum, copper or any other type non-reinforced conductor show it will not take abuse of overloads or excessive currents as well as ACSR, a very important point with all utility customers. Alumoweld should perform more like ACSR in this respect.

Mr. Kessler pointed out there is some confusion in aluminum clad steel wire. It was pointed out Public Service of Colorado buy No. 4 ACSR .203 by .0916 in. whereas the combination is .236 by .016 in. aluminum over steel for all other customers. It was pointed out that the No. 4 wire furnished to Public Service of Colorado was really No. 5, but they refused to accept this designation. Mr. Kessler cautioned that sooner or later this situation will cause [fol. 5299] trouble. Mr. Guess will make efforts to get this ambiguity cleared up. Delays in recent ACSW orders have been caused by delay in receiving stock from New Kensington. The question of what the actual cost of ACSW is, and whether a profit is being made will be investigated.

There was considerable discussion of the merits of Alumoweld both for use as conductor and core wire, and Mr. Coffin expressed high hopes for this product. Mr. King thought there was a good possibility of raising the conductivity of Alumoweld by better control of the impurities in the aluminum powder.

Mr. Kessler reported that we have one customer, Louisiana Power and Light, using a great deal of 7-strand all-aluminum smooth body conductor in the form of polyethylene covered service drop, purchased through our Graybar distributor. 418,000 ft had been purchased since the first of the year. Mr. Kessler is investigating disposing of 23,000 ft of surplus inventory of No. 2 Smooth Body Conductor.

Mr. Kessler reported that unfortunately we have been unable to obtain any information from G.E. on bunched conductor made at their Asheboro, N.C. plant. This conductor was to be used for electric blanket control wire. However, due to the lower price of copper G.E. seems uninterested in this project at this time. Mr. Cope suggested

that after we get the buncher we can go back through American Insulated Wire and get some results. Mr. Kessler agreed and commented it would be easier to work with AIW as they were closer to Massena and had indicated more interest in the problem. However, he warned that aluminum lamp cords were going to appear rather bulky because of the difference of conductivity compared with [fol. 5300] copper. In the past AIW did not want to release a buncher for experimental work thus reducing their overall plant profits.

Mr. Kessler reported his recent difficulties in obtaining 62.0% minimum conductivity and that studies were being made for better control. It was pointed out that the ore being received by Vancouver is much better grade from an electrical conductivity point of view than that received at Massena, which is higher in silicon. Mr. Kessler anticipates further trouble until the new potrooms are well broken in but that this will be watched with diligence. Mr. King questioned that serious troubles were being experienced. Mr. Kessler reported that although we are having periodical difficulties we are riding along on the narrow edge. However, all EC conductor meets the 62.0% minimum conductivity.

There was considerable discussion concerning the application of 10/64 in. thick covering on conductor. It was pointed out that there is a sizeable amount of business in this product, but at present Massena has no facilities for testing the finished product. Additional electrical testing apparatus costing between $25,000 and $30,000 would be required. Mr. Coffin suggested that Rome Wire and Cable be contacted to determine at what price they would make these tests for us in case we get an order. Mr. Gilbert agreed to check.

The subject of identification of Massena Stranded Conductor was discussed at length. Identification by mechanical indentation or by ink or paint were discussed. Prices quoted on mechanical devices in the past were considered excessive. Apparently the method used by Vancouver to identify conductor furnished the Southern California Edison Co. using orange paint has been satisfactory and the [fol. 5301] cost has been nominal. Mr. Coffin's objection is that there is no certainty the paint will last 20 to 30

years. Mr. Coffin insisted that it is very important to find a practical way to identify Alcoa Conductor. Mr. Guess pointed out that this problem had been on the agenda for years. Mr. King described a method where certain impurities are cast in the ingot and the product can be identified metallagraphically, but convincing the customer might be difficult. Mr. Lane asked for an investigation through sales research and operations to study the problem of identification, and to come back to the next E.C. Subcommittee meeting with an answer. It was pointed out that a Task Force had been in existence and that many suggestions were on record but all appeared too costly or were otherwise unacceptable. Mr. Englehart reported that the tests on paints submitted by Vancouver had not been going long enough to come to any conclusions. Mr. Turner said they buy their paint from Walker Paint Co., Salem, Oregon. Mr. Hartmann pointed ou that lamp black would be satisfactory for changing the color of the orange paint used at Vancouver. An Alcoa blue color would be more desirable but additional tests would be required. Mr. Kessler moved that the committee suggest to Massena and Vancouver that all stranded conductor be identified by the orange paint similar to that used by the Southern California Edison Co. if Southern Cal has no objection to such use. Mr. Coffin seconded and the motion carried. Mr. Guess was asked to secure the Identification Committee's O.K. for this procedure. It was pointed out the original purpose of the orange paint was to identify conductor stolen from Southern California Edison property. However, in case they object to our use of the orange color, lamp black or yellow paint can be used with reasonable chances of success. Mr. [fol. 5302] Dallye reported a recent case indicating the importance of proper identification of Alcoa products. Kansas City Power and Light had some copper bushings made by an outside contractor and installed in Alcoa clamps. Without the Alcoa marking numbers indicating that the clamps were originally unbushed, this would indeed have been very puzzling, but because of our marking was easily solved.

Mr. Kessler reported on the covering of No. 8, 10, 12, and 14 AWG solid and stranded insulated control conductor for Alcoa requirements. Mr. Wagner recalled numerous

complaints from plant people on certain conductors supplied by Massena. Mr. Guess pointed out that this difficulty had been cleared up and that Mr. Gunther was preparing specifications for Massena to work from.

Mr. Kessler reported that stranded conductor with steel core made of Alumoweld for 1/0 ACSR 6/1 and 636 MCM ACSR 24/7 is planned. Fabrication of these conductors is being delayed by the heavy mill schedules, around 5,000,000 lb a month. It was agreed that the manufacture of these conductors would be worked into the schedule as a research project.

VII. Review of Investigations at Alcoa Research Laboratories

7-C-12 & 7-E-5. Mr. Hartmann made reference to the Sept. 4 progress report of ARL covering work of all divisions on electrical conductor and proceeded to report on the first several items covering static properties of No. 2 EC in various tempers, effects of temperature, creep and fatigue, flexural creep of No. 2 EC and properties of No. 2 EC-T84. This work is nearing completion and formal reports will be issued as soon as possible.

[fol. 5303] *7-E-7.* Mr. House reported that heat cycle tests on "pigtail-type" connectors (JO 16-357) run for Mr. Gunther to evaluate connectors to be used in Alcoa plants was complete and the information passed on to interested parties. Final report is being prepared.

7-E-8. Mr. Tompkins asked about the status of the work on bus conductor in stacks (JO 16-149). Mr. House replied that Mr. Bond would resume work on the report as soon as possible. This work had been delayed by the investigation of bolted lap joints in bus conductor and the unforeseen difficulties arising from the use of unplated against silver-plated conductor. Mr. Keller is continuing the study of this problem. Recent heat cycle tests of thick silver plated bus against thin plated bus indicate that no trouble is to be expected from this type joint.

A rather intensive test, JO 16-351, has been under way for some time in an effort to find a more satisfactory aluminum-to-copper connection for use in Alcoa potrooms. Aluminum-to-copper joints abraded through No. 2 EJC

increased approximately 30% in resistance while aluminum-to-aluminum and copper-to-copper control groups were stable. Mr. Tompkins raised the question of whether joining aluminum to copper was a serious question outside of the potrooms, and Mr. Wagner questioned the seriousness of this problem even in the potrooms. However, it was reported that at the Massena Works the aluminum-to-aluminum joints will last the lifetime of the pot, which is about 3 years, whereas the aluminum-to-copper joints must be remade once a year. Mr. Wagner said he doubted if this was done, certainly not on a company-wide basis. Mr. Guess recalled that the Alcoa Tennessee Smelting Operations had reported essentially the same results as [fol. 5304] Massena on copper-to-aluminum joints. Mr. Tompkins and Mr. Wagner agreed that the deterioration which takes place in aluminum-to-copper joints should be further investigated but they believe it is not a serious problem in the plants, certainly not as serious as aluminum-to-silver joints. Mr. Tompkins does not like the use of Alcuplate. It was pointed out that one of the old St. Lawrence potlines which will be restarted in the future will have Alcuplate wafers in aluminum-to-copper joints.

It was decided to drop JO 16-369 covering Handy and Harman Silver Particles Products for Joint Compounds because of unsatisfactory results both here and at G.E. Under JO 16-408 Mr. Dallye asked if the work Dr. Lewis was doing on X & R of Bus Conductors would be similar to that by Prof. Higgins. Mr. House reported that this would be an entirely different approach in which the 650 IBM machine would be used in conjunction with help from Dr. Whidden's group to provide tables for the Alcoa Bus Conductor Handbook. The cost will be less than $2,000/year.

It was explained that JO 16-416, "Contact Resistance Measurements of Experimental Joint Compound in Stacks of Bus Conductor", was being carried on because of sales resistance to No. 2 EJC. Mr. Tompkins asked if much of this work had not been done before, but it was explained that a thorough review, taking into account the older work, seemed to be justified in the light of recent developments. No. 2 EJC is meeting sales resistance because of the safety warning on the can and for other reasons. Mr. Hartmann

advised that Mr. Keller also has money in its budget for studying joint compounds. One problem is the part played by zinc particles in Penetrox. Mr. House explained that a technical paper is now in preparation that will present [fol. 5305] the long successful history of No. 2 EJC for bus conductors and other evidence to show that it makes excellent electrical joints. The purpose of this paper is to give our sales force ammunition to combat aggressive competition and sales resistance they are now encountering.

7-E-9a. Mr. Tompkins raised the question of continuing tests on mineral insulated conductor (JO-XE273). General Cable has not been able to supply this type conductor in commercial quantities. It was agreed that the tests be discontinued. Mr. Englehart advised they are designing a large-scale experiment on all types of silver-plating. Mr. Tompkins said as long as the test was purely for resistance to corrosion the use of bolted joints in the corrosion test did not seem justified. However, Mr. Hartmann and Mr. Englehart both pointed out that different results were obtained from bare bus and bolted joints and to make the test complete both should be tested.

Mr. Englehart said there is no difference in performance in salt spray test between economy grade and quality grade fixtures manufactured by Leviton Manufacturing Co. Mr. Cope pointed out the reason for these tests was to assist Leviton in going to Underwriters to get approval on outdoor lamp sockets. It was pointed out that Leviton has not made fixtures to specifications for outdoor use and that their product could be classed as extremely light duty. These products were not intended for industrial applications such as Alcoa has, but since Leviton is a good Alcoa customer we should do what we can to help improve their products.

7-G-1. It was decided to remove XE-17, Electrical Conductor Containing Boron, from the Problem List.

Mr. Englehart reported that aluminized steel wire after [fol. 5306] one year's exposure to 3½% salt spray, 100% relative humidity at 125°C has continued to show superiority to standard hot dip galvanized wire. Mr. Kessler raised the question of the necessity of the continuity test on aluminized core wire, pointing out that if enough tests are

made, almost any lot will eventually pass. Mr. Coffin pointed out that recently Mr. Holcomb had been setting up a statistical quality control system with Page. After they have this going he thought test work which we are doing, which is in a sense a repetition of their tests, would indicate improved quality, and for this reason did not wish to discontinue our tests. Mr. Coffin pointed out that we are getting considerable business because of aluminized core wire and it would be a mistake to discontinue our test programs because it is very important to be able to tell customers we are making every effort to see that they get a first-class product. Mr. Engelhart reported that investigation is under way for obtaining a more rapid evaluation of the continuity of aluminized steel core wire in the hydrogen evolution test.

Mr. Englehart reported that Alumoweld wire under JO XE-296, has shown up quite satisfactory, although they are rather extensively contaminated with copper smears. Alumoweld steel wire could possibly be used for cables for Stockbridge Dampers and may have superior damping characteristics. Such cables have been prepared using aluminized core wire.

7-G-3. Mr. Hartmann read Mr. Sawyer's report, Protective Coatings for Steel Core Wire. Mr. Hartmann pointed out that three greases are being investigated by ARL, the most promising of which appears to be Kenlube B-521. Mr. Coffin made the motion that the use of Unoba A2 be continued until the results of research study were avail- [fol. 5307] able at which time the problem would be reviewed for decision on what product to use. Mr. Kessler seconded the motion and the motion was carried.

7-G-4.1. There was considerable discussion on the proper use of test data showing the superiority of Alcoa armor rods over Preformed, both as to the reduction in conductor vibration and increased fatigue life (JO 16-202). It was agreed that until the full story is developed it would be unwise to make any publication. Mr. Hartmann suggested a printed report for internal circulation. This type publication would not hurt our relationship as much with Preformed Line Products Co., who are also a customer.

It was decided that JO 16-76, Effects of Various Armor

Rods on Lengths of End Loops on 397,500 cm ACSR and 795,000 cm ACSR, be dropped from the Problem List.

There was considerable discussion concerning the development of dampers for structural members (JO 16-108) and the promotion of aluminum transmission towers and substation structures. It was agreed that most of the vibration of transmission tower members was induced from the transmission conductors rather than wind forces acting on the members themselves. Mr. Coffin pointed out that early in October a group from the Philadelphia Electric Co. were coming to Massena and that he would like to have a good story on the use of aluminum towers from ARL. Mr. Hartmann replied that this suggestion would be followed up. Mr. Kessler pointed out that on the radar towers constructed of structural aluminum on the DEW line in Canada, many of the component parts were manufactured at Massena and that there were no complaints because of vibration, where winds occur all the way from 0 to 100 mph. Mr. Wagner pointed out that in all substation struc- [fol. 5308] tures at Alcoa plants no trouble had been caused by vibration induced by wind. It was pointed out that the cross-arms on the Cedars Towers had shown no signs of vibration and it was generally conceded that aluminum towers would have no more tendency to vibrate than most steel towers. However, it is appreciated that aluminum has less fatigue strength. Mr. Tompkins pointed out the need for an effective damper for tubular bus such as used at Wenatchee, which would preferably go inside the bus. Mr. Hartmann cautioned that when aluminum towers are used an educational program on the use of aluminum bolts will also be necessary as many riggers using these bolts for the first time will twist them off.

Mr. Dallye raised the question if reports on the Sacramento River Crossing and Joppa Crossing, JO 16-177 and 16-152, should be dropped. Mr. Tompkins pointed out that a great amount of work and money had been spent on both of these projects and it would be well to have a final report. It was pointed out that the trouble on the Sacramento River Crossing has not been solved yet as they are having trouble with damper failures and have recently ordered a new supply.

Mr. House reported the development of a new hot line

recorder for vibration records which works very satisfactorily (JO 16-370). Mr. Hyde in his recent visit to Massena thought that it would fill the bill for the field men. Mr. Tompkins suggested that it be installed on the St. Lawrence River Crossing Towers, in the Cedars circuits, as he wished to have vibration information on this span. It was agreed that this should be done. Mr. House reported that natural vibration tests of 795,000 cm ACSR 26/7, containing 2 coated strands had been in progress for some time (JO 16-393). Visual inspection of these conductors from the ground does not indicate that much damp-
[fol. 5309] ing is taking place.

It was agreed to discontinue JO 16-119, Vibration Fatigue Tests of X6064 Alloy Wire, and JO 16-200, Tests of 400-ft Spans of ACSR and Galvanized Steel Wire to Compare Self-Damping Characteristics.

Mr. Hartmann spoke briefly about the proposed papers on Early Vibration and Fatigue Tests on Stranded Conductor (JO 16-419). All members of the committee who have any information on early dates were asked to write Mr. Simpkins. It was suggested that perhaps Mr. Hemeter could be helpful.

7-G-4.2. Mr. House reported on JO 16-242, Natural Vibration Tests on Bundle Conductors. These tests indicate that armor rods do not have the same beneficial effect in reducing vibration in bundle spans that they have on a single conductor. Mr. Dallye asked about the use of armor rods on the G.E. Extra-high Voltage project, pointing out that dampers were going to be used and most of the spans would be bundled. With the large shielding rings there would be practically no chance of flash-over near the suspension clamp. Mr. Tompkins pointed out that the only reason for using armor rods other than to suppress vibration and protect against flash-over, would be to protect the conductor at the suspension clamp. He did not feel that this would justify the use of armor rods, as modern clamps would not be expected to damage the conductor. Mr. Dallye also pointed out that the contemplated changes during the test program on the G.E. EHV project were considerable and in many cases the conductor would probably have to be moved in the suspension clamp in which case the presence of armor rods would greatly complicate the work and in-

crease costs. It was agreed that armor rods should not be used on this project.

[fol. 5310] Mr. House reported on JO 16-259, Investigation of Longitudinal Motion of Bundle Conductors, which is a fatigue test of the spacers. Mr. Turner reported on the Bonneville system, where bundle conductors had wrapped around each other. It was pointed out that Mr. Mather of Bonneville considers our test much too severe and Mr. Tompkins agreed. However, it was pointed out that every type spacer that had been in service in Europe is now beginning to give mechanical difficulties, consequently there is no proven spacer on the market. By such a test as ours we may develop a spacer that would be far superior to any yet made available commercially. Mr. Dallye reported that he had checked with Mr. Gross concerning the condition of the Alcoa articulated spacers which had been in service on the Muskingum-Tidd circuit of the American Electric Power Corp. Mr. Gross reported that some had been taken off. After 2 years of service there were no markings on the cable and no wear on the spacer. They were quite pleased with the service so far. It was pointed out that Preformed has probably had trouble with Preformed spacers abrading the cable which might be the reason for the polyvinyl jacket on the end portions of the Preformed rods. Closed spring spacers were discussed and it was pointed out that the closed spring must be made of stainless steel or some other noncorrosive material. The possibility of an aluminum alloy spring was suggested but it was thought that such a spring would probably take a permanent set during unusual movements that occur during nonuniform ice unloading. Mr. Dallye raised the question if all 3 type spacers should be installed in the G.E. EHV project, namely, articulated type, unibal type and closed spring type. It was agreed that this should be done.

[fol. 5311] *7-G-4.3.* Mr. Rawlins reported on JO 16-97, Study of Stockbridge Dampers, being carried out by analog computer. It was though at the time of the last meeting that we were very near a circuit which accurately imitated the performance of dampers. Recently 2 series of check tests have been made, the first of which checked very well, the second of which did not check close enough. Ac-

cordingly, further steps are being taken to get a more accurate circuit. Once a satisfactory check has been obtained a complete line of dampers will be devised that will cover the full range of conductor size and span lengths to be protected. Mr. Dallye pointed out that when this system is developed it will be very helpful in dealing with the customers. Mr. Tompkins raised the question if we should go ahead with what we already know and design an improved set of dampers. Mr. Hartmann replied that this could have been done 6 months or a year ago, but that we are so near a more complete solution that he believes that the work should be completed, which he hopes will be soon. Mr. Coffin raised the question of there being a patentable damper design arising from this work and Mr. Hartmann replied that that was a good possibility and was being investigated. Mr. Coffin advised that he had been approached several times by the Anderson Electric Co. to get into the damper business. Mr. Coffin feels in light of the amount of money and time Alcoa has invested in this program that we should not let any other manufacturers in on the deal. Mr. Coffin pointed out that if a new line of dampers is developed it would be a sales advantage to have them look different from the present line. When the new line of dampers comes out a technical paper should be published, to exploit the work that has been put into the new design.

[fol. 5312] Mr. House explained that JO 16-292, Investigation of In-Span Damping Devices, is in effect a model test of the Sacramento River Crossing. The damper and weights at the third point were quite effective, indicating that Mr. Tompkins' original solution is sound. Mr. Coffin inquired if this information has been passed on to P. G. & E. Co. Mr. House advised it had been. Mr. Coffin said he was expecting to be in San Francisco in the near future and would discuss the matter with them. Mr. Tompkins pointed out that the mathematics of the weights at the third point with the 2 dampers on each side had been analyzed very well but the use of 2 dampers only at the third point had not been analyzed mathematically. He suggested that this be done, perhaps securing outside services of such a person as Dr. Merrill who has done work in the past for Alcoa. Mr. Hartmann advised that he thought

Messrs. Rawlins and House should work out a plan and, if it seemed desirable, Mr. House could contact Dr. Merrill.

Under Investigation of Festoon Dampers, JO 16-201, Mr. Simpkins reported that we now have the test spans of 400, 300 and 500 ft in series and tests to check the vibration characteristics of undamped spans are now progressing. Mr. Coffin pointed out that he recently discovered that Copperweld has a patent on a spiral damper which they have been selling for use on Copperweld conductor. This could be the damper we need for small conductors. Mr. Coffin advised that if the E. C. Lab would tell him what we need for the outdoor spans he would get these from Copperweld for evaluation.

Mr. Tompkins questioned the value of high humidity tests for Stockbridge Dampers or other products (JO 16-364). Mr. Englehart said this was a good comparative test and was quite useful in evaluating the differences be-
[fol. 5313] tween platings, paint and other types of finishes. It is planned to compare Stockbridge Dampers which have been immersed in No-Ox-Id and those that are perfectly clean.

7-G-5. Mr. House explained that there had been no testing done at Tidd for over a year (JO 16-187). Considerable testing was done on grit-blasted conductor but supplementary tests on mill-run conductor had never been made. Mr. H. L. Rorden of the American Electric Power Corp. advised that it would take approximately $5,000 to relocate the power supply which was necessary because of new construction. It has never been clear who was to spend the $5.000, whether it would be American Electric Power, Alcoa, or both. Mr. Rorden said that before anything could be done they would need a communication from us stating that we were interested in completing the tests. After considerable discussion it was finally decided Mr. House should write Mr. Rorden to obtain full details, then the matter would be taken up with interested parties on the committee.

Mr. House reported on the recent inspection trip made to the experimental test circuits of Public Service Co. of Colorado at Leadville (JO 16-263). A brochure on the project, containing a number of photographs, was passed among the members of the committee. It was reported

that all of the data had been recorded graphically and was sent to East Pittsburgh for processing. No information has been released by Westinghouse concerning any of the results. However, considerable newspaper publicity was given to the AIEE group that made the trip to Leadville. Mr. Tuttle raised the question as to who in Pittsburgh was contact man between Westinghouse and Alcoa on this project, and Mr. Coffin replied that since Mr. Phillips' death no one had been assigned to this, but that it would be Mr. Sandell.

[fol. 5314] Mr. House reported that a report on the emissivity project with Purdue has been received in the form of a thesis by Mr. Rigdon, with supplemental letter reports (JO 16-274). The question was raised concerning tests of about a dozen more samples which were exposed in our Santeetlah and Alcoa installations which would give a relationship between emissivity and time of exposure from one month up to one year. It is estimated that this work would cost between $500 and $1,000. It was the consensus that this work should be completed and the results reported in a technical paper. Mr. House will write Dr. Grosh.

Mr. House reported on the status of the X & R Tests and Electrical Characteristics Booklet (JO 16-276, 16-339, 16-397). The thermal characteristics data have been approved by the Editorial Committee and are now in the hands of the printers. Work on the reactance and resistance is being rushed. Mr. Guess explained that the new policy on the Electrical Characteristics Booklet was to have several component parts in a loose leaf binder all in the same style printing. Mr. House inquired if the new Thermal Characteristics Booklet would be out by the first week in October for distribution at the EEI meeting in New York, and advised that Mr. Sanford had asked him to prepare a Table of Current Values for Stranded Aluminum Conductor over the full size range so that the current required to bring any given conductor up to 125°C could be immediately read off. This has been done and on the same sheet are the so-called normal ratings of conductor for both still air and 2 fps. Mr. House advised that he did not like to distribute this information prior to the coming out of our new booklet and Mr. Guess hoped we could stall until the

book would be out. The Publications Department later [fol. 5315] suggested advising that the material had been abstracted from a copyrighted Alcoa publication.

Mr. Coffin commented that he would like to have some X & R data of Alumoweld Wire, both when used for a core wire and when used as a 7-strand conductor. Mr. Tuttle advised that at present the conduit test is scheduled and then these tests on Alumoweld could be worked in. Mr. Guess emphasized that Mr. Tuttle should not spend any time on other tests until the X & R Booklet is out. He would like to have the data by November 1st in order that we can get booklets out before any other manufacturers get out similar data. It was agreed that Mr. Wagner contact Mr. House to discuss using one of his men who has completed his work in the construction of the St. Lawrence Plant additions. This was subsequently arranged and Mr. Greathouse is assisting in the drafting of the booklet. It has also been arranged that Mr. W. B. Howitt will assist Mr. Tuttle in the computations.

It was reported that the High Current Tests Relative to REA Approval of Polyethylene Triplex (JO 16-345) had been completed and 8 reports sent to Mr. Lewis for presentation to the REA. Mr. Guess reported that Mr. Lewis is making good progress toward getting polyethylene approved.

The Extra High Voltage Project which G.E. will conduct near their Pittsfield Plant, in which Alcoa is a participant, was discussed at length. It now appears that the project will probably cost $250,000 over a period of 4 or 5 years instead of the $125,000 originally estimated. This is because of a large number of added features such as all-aluminum substation structure and aluminum lightning rods on various towers. It was agreed that if we did not [fol. 5316] fully participate it would mean the entrance of our competitors into this project. The general plan for handling the expenses would be for ARL to prepare an R. for A. based on estimates by Mr. Larson and Mr. Dallye. It was suggested that the 1959 ARL Budget should carry an item under 10-J.

7-G-6. Mr. Tompkins inquired if annealing tests of ACSR at Purdue, JO 16-160, would be worked into a paper. It was reported that this had been agreed to at the last meet-

ing and would be done. It will also be part of Mr. Rodee's paper on sag tension. There was considerable discussion concerning the use of tensile creep tests of 397,500 cm 19-strand all-aluminum conductor at room temperature and at 95°C which was covered in an ARL formal report, by Mr. W. B. Howitt. Some of this information had been used in a paper by Mr. George Phillips for South Eastern Electric Exchange Meeting in Biloxi. Mr. Coffin advised that portions of it would appear in an article in "Electrical World" in the near future. Mr. Tompkins pointed out that this is very valuable information and should be worked into an AIEE Transactions Paper. It was agreed that this should be done. It was agreed that tensile creep tests on 1.75 in. diameter Expanded ACSR would be left on the Problem List.

There was considerable discussion concerning the merits of Properzi Rod (JO 16-329). It was reported that this process was very good for small operators but for large concerns such as Alcoa it would require too many machines. The actual cost of conventional rod at both Vancouver and Massena is estimated to be only a small fraction of a mill higher than Properzi Rod made at Vancouver.

The question was raised concerning the publication of the icing tests of stranded conductors (JO 16-355) origi- [fol. 5317] nally suggested by Mr. E. L. Peterson of the American Electric Power Co. Mr. Coffin expressed the opinion that it should be a joint paper by Alcoa and Mr. Peterson, as he had been a faithful friend of Alcoa even though A. E. P. Co. is throwing business to Kaiser at the moment. However, Mr. Coffin feels that Mr. Sporn has had some unpleasant experience with Kaiser products and is beginning to mellow toward Alcoa. It was agreed that Mr. House should work through Mr. Gross on the joint paper with Mr. Peterson.

Mr. Simpkins reported on tests on EC-H19 Wire which had been flexurally hardened through rollers (JO 16-372, 16-373). The higher tensile creep strength and recrystallization temperature predicted by Armour has been confirmed. Mr. Kessler raised the question as to the practical use of this information. After considerable discussion it was agreed that Mr. King would take this up with the Central Metallurgical Department.

It was reported under JO 16-396 that rotating beam fatigue tests on additional samples of Alumoweld wire revealed an endurance limit of 35,000 psi as compared to 29,000 psi for the original samples. Mr. Hartmann pointed out that all the Alcoa test data on Alumoweld was covered in a recently issued summary report.

It was reported under JO 16-417 that losses in aluminum conduit would be determined and compared with losses in steel conduit obtained during tests that G.E. made several years ago. This test is designed to show the superiority of aluminum conduit both during normal operating conditions and under short circuit conditions and to investigate the integrity of standard coupled conduit joints under short circuit conditions. The results should be valuable to both our sales and engineering departments.

[fol. 5318] Mr. Kessler discussed under JO 16-422 the proposal made by Kaiser to the ASTM Committee B-1, Subcommittee VII—Task Group 17, concerning the use of cold welded joints on the outer strands of 7-strand conductor. No welds would be in the center strand and the welds on the outer strands would be limited to 50-ft intervals. The reason for this proposal is to obtain longer lengths of conductor. Mr. Coffin expressed the opinion that this move should be killed if possible because it would confuse the competitive situation and lead to complications in reels. Mr. Kessler said he felt there was a good chance of discouraging its adoption because fatigue tests show the wire with these welds to be inferior to normal. It was agreed that Mr. Kessler should discourage the Kaiser proposal.

7-H-2. Mr. House called attention under JO 16-141 to the test results on the remaining connectors of the first group installed at Sutro and the performance of connectors installed about a year ago. At the last meeting it was decided to taper off at Sutro and when all connectors were out of circuit to put no more in. It was pointed out however that this is a very excellent contact with P. G. & E. and once we pull out it may be hard to get back in. Mr. Englehart expressed the opinion that if we could produce a product that would stand up under this severe environment we would really have something to shout about. The test has been relatively inexpensive and the site is convenient

to San Francisco as compared to the Jenner Test Site which is 75 miles north. It was the consensus that we keep something going at Sutro as long as the P. G. & E. people were willing to have us participate.

Under JO 16-387, Evaluation Test of Modified Alcoa No. 2 EJC with Acrawax, Mr. Dallye questioned the use [fol. 5319] of term "unstable resistance" and suggested "erratic resistance ratio". Mr. Lanctot will check the records and make any necessary corrections. Mr. Hartmann called attention to Mr. Sawyer's report, starting on page 38 of the ARL Progress Report, covering other work on Alcoa No. 2EJC.

The heat cycle tests at 150° and 200° C operating temperature of conductor, JO 16-413, were initiated because of the EEI Performance Specification Task Force work where tests above 100° C were advocated. The clamps have operated satisfactorily for over 500 heat cycles. The temperatures have been raised by increasing the current and now the conductor temperature is approximately 400° C. None of the p. g. clamps have failed, although those that were assembled without any joint compound have considerably higher resistance ratios than those with No-Ox-Id and Alcoa No. 2 Joint Compound. These connectors have a resistance ratio below 1. The reason for these higher temperatures was to check a theory advanced by Armour Research Foundation that at 212° C an aluminum joint completely disintegrates and resistance ratio and temperature take a very sharp increase upwards. Our tests have not borne out this contention.

7-H-4. Mr. Englehart reported that the Chemical Metallurgical Div. had been overloaded with a considerable amount of work on the panel testing and consequently a great deal of the electrical work in their division had been delayed. He reported that additional help has been secured and better progress is expected. Under XE-238 Mr. Kessler raised the question whether the 50-50 solder was enough better than 802 solder to warrant its more difficult application. Mr. Kessler advised that they would like to go back to the 802 because it is more economical. It was agreed that 50-zinc and 50-tin solder would be discontinued and 802 would be used in the future. [fol. 5320] It was pointed out that development work is

underway for an improved 805 solder for use for sale through commercial outlets. Mr. Kessler reported it was his understanding that there is a flux of 805 solder which is water soluble, and noncorrosive so it need not be removed from the finished product. Mr. Kessler said that he would not use this new 805 solder till Mr. Englehart gave the word to go ahead.

10-F-35. Mr. Hartmann reported on Mr. Howell's work on the standardization of electrical conductivity measurements of various alloys and temper (JO 9-10644). Mr. Hartmann asked Mr. King to introduce the subject of the improved conductivity of No. 2 EC. In connection with his work with Cressona and Lafayette discrepancies in conductivity were discovered. This was traced to the use of the Magnatest Meter for conductivity measurements and Mr. King advised that he considered the variation in measurements entirely too high for this type work. He pointed out that Mr. Howell had recommended that all plants go to the potential drop method as recommended by ASTM. Cressona does not feel that they are justified in going to the potential drop method. They claim that measurements by the potential drop method will cost over ten times as much. There was considerable discussion concerning the relative merits of the Magnatest and the bridge method for measuring conductivity. Mr. Coffin strongly urges that the standards not be lowered and all agreed that the Magnatester was not accurate enough for the conductivity measurements which our advertising claims. Mr. Guess made the motion and Mr. King seconded it, that this Committee go on record as stating that the bridge method for conductivity measurements is necessary to maintain proper high standards. Mr. Guess pointed out that we should watch any new developments in method of measuring con- [fol. 5321] ductivity and if some quicker and cheaper method of the required accuracy becomes available that we should investigate it. Mr. Coffin pointed out that he expected to get out a letter to all conductor salesmen, pointing out that all electrical conductors could be guaranteed 62.0% minimum conductivity. Mr. Guess reported that he had checked into this with the Central Metallurgical Division and they agreed that we could safely guarantee 62.0% conductivity on all EC Conductor, bus bar and wire

products. There was considerable discussion on the material to go into Mr. Coffin's Memorandum. It was pointed out that General Cable was buying Alcoa rod where they have to meet the 62.0% specification. It was reported that 62.0% conductivity material was costing Anaconda 5 cents more per pound.

VIII. Miscellaneous Items

The cooperative test program with Okonite was discussed briefly and it was pointed out that samples covered with polyethylene had been sent to Okonite for comparative tests with Neoprene insulated conductor which had failed in service at some of the Alcoa plants. It is believed this test will convince Okonite that polyethylene is much more effective as a cable covering than Neoprene which will admit moisture causing corrosion.

Mr. Kessler reported that degassing equipment for improved quality cast accessories has been installed.

There was considerable discussion concerning the preparation of a paper on the aluminum bus in the Massena Powerhouse which has been in operation over 50 years and will be dismantled in the near future. It was emphasized that all necessary pictures should be taken without delay. Mr. Wagner thought that it would be helpful if Mr. Lanctot [fol. 5322] assist in the preparation of this paper. However, subsequent to the meeting Mr. Lanctot checked with Mr. Prashaw and found his work was well under way and that this assistance was not needed. Mr. Pitman is heading up the actual preparation.

Mr. Kessler reported that in accordance with the minutes of the last meeting, greater activity in the Wire Association was under way. He pointed out that in presenting papers at these meetings, Kaiser has led the field by far. Mr. Coffin urged that in any papers we present we do not want unwittingly to give away any of our know-how. It was pointed out that the Wire Association does not concentrate wholly on electrical conductor but is interested in all applications of wire. Mr. Kessler reported that Alcoa had not been invited in the original setup of the Wire Association but Mr. Kessler, through negotiations, became a member of the committee.

Mr. Kessler reported that as part of the cost reduction

program changes in the length of lay have been investigated. He reported that Mr. Rodee was against any change. Mr. Rodee's position is borne out by recent difficulties Kaiser has had with having to take back considerable amount of ground wire which had an extra long length of lay of aluminum and a short preformed length of the steel, resulting in failure of the aluminum strands.

Mr. House reported on the work of the Edison Electric Institute, Steering Committee on Aluminum Connectors, and pointed out that Alcoa is the only manufacturer that has been against their proposed method of test, maintaining that such a method would allow inferior clamps to be accepted and result in a great deal of harm to both the public utilities and the use of aluminum for such fittings. The so-called performance specification is not really based on any work done at the Armour Research Foundation, al- [fol. 5323] though that supposedly was the goal of this program. The difference in measurements and ratings of clamps was explained and it was pointed out that the proposed method favored poor clamps and did not particularly help good clamps. It was pointed out that the proposed method penalizes a connector with a resistance ratio below 1 and aids a connector with a resistance ratio above 1. Mr. Hartmann asked if we should work through ASTM where a standard method of comparing joints might be adopted. It was pointed out that perhaps Mr. George Stickley's group could handle this through ASTM, to get a standard method of making comparisons of electrical connectors. Mr. Hartmann agreed that he would contact Mr. Stickley.

Stab connections to aluminum bus bar were discussed and Mr. Chapman pointed out Mr. Gunther's opposition to silver plated aluminum bus bar. However, it was recalled that it had been previously decided not to approach the Underwriters' Lab on this problem. It was agreed that Mr. Chapman would procure several different types of silver-plated stab connectors in order that Mr. Englehart could start some corrosion tests.

The question was raised by Mr. Hartman concerning the tests of aluminum anode bus connectors which had been on the books for some time. All the samples are on hand. It had been previously decided that since the new designs

had been completed the information from the tests was not badly needed now. Mr. Wagner pointed out it would be better to wait until the new potrooms have had experience with their present connections, so it was agreed to let the matter remain inactive for the present. It was estimated that any work on anode bus tests could not be started before the next meeting of the Subcommittee and probably [fol. 5324] not for a year. It would require 2 months to run the tests. Mr. Wagner agreed that if the tests were needed sooner he would advise interested parties.

Mr. House asked for an expression from the committee on the purchase of a creep machine for elevated temperatures, advising that he had recently secured a firm quotation on a suitable piece of equipment. Motion was made by Mr. Guess and seconded by Mr. Cope that the R. for A. be prepared showing that the Subcommittee had recommended purchase of this machine. The motion was unanimously carried.

Mr. Wagner reported that Mr. Gunther had brought up the use of aluminum in safety switches, which are now universally made of copper. This would be an excellent outlet for aluminum if the details of the application could be worked out. It was pointed out that there were many homemade aluminum disconnect switches at some of the company plants, however, these are merely isolating switches and do not break load. Mr. Wagner reported that good progress is being made in the manufacture of aluminum outdoor disconnect switches for high voltage switchgear. However, the use of aluminum in safety switches is at a standstill. It was agreed that Messrs. Cope and Chapman would follow this project and report back to the committee as to the possibility of developing this market for aluminum. Mr. Wagner said that they would be glad to try any equipment in the plants and give any assistance in the design of terminals and other features.

Mr. Guess reported that Messrs. Rodee and Sandell had been working with IBM people to develop an IBM method for sag tension calculations. Mr. Hartmann reported that considerable work had been done at ARL on IBM programming. Mr. Tompkins reported that they were doing work with Dr. Whidden on studies for the new plant in Suriname.

Mr. Tompkins inquired if there was any effort to increase [fol. 5325] the staff of the ARL Electrical Engineering Div. and Mr. House reported that 2 new men had been acquired this year. Mr. Hartmann pointed that while we were not actively searching for new men we were interested in knowing of outstanding prospects from outside or through plant transfer.

Mr. Tompkins asked about the status of the electrical measurements laboratory and extending its use. It was pointed out that if the services of the measurements laboratory were widely used by the company plants more personnel would be needed. Mr. Wagner expressed some doubt as to just how much the measurements laboratory could be used by the plants and it was pointed out that when standards are checked, such as rotating standards, the work is done by the local power companies, so that errors resulting from shipment would be avoided. It was generally agreed that the measurement laboratory was in excellent position to help Massena Works and has done so.

IX. New Projects

Mr. Coffin said he would like to get some X & R tests run on stranded Alumoweld as soon as possible.

It was reported that duPont had shown considerable interest lately in aluminum blasting wire and that we are supplying them with some 5005 samples for evaluation. One of the main difficulties is joining to the blasting cap. Mr. Chapman reported that the customer usually does not know what properties they want, some want extra elongation so as to avoid breakage of the wire, and there seem to be a great many unanswered problems. Mr. Kessler had previously pointed that one of the things that made aluminum wire attractive was that there are some blasting operations where minerals are being mined that could not stand any contamination from copper but that aluminum is [fol. 5326] satisfactory. Mr. Coffin pointed out that Alcoa's own Mining Division had put the use of aluminum blasting wire on the shelf because of difficulties in trying to use it. Mr. Coffin stated there is quite an extensive report on this. Mr. Kessler reported that Hercules had an aluminum clip that seems to work satisfactorily with the clamp to connect

the cap to the wire. It was estimated that there is a potential market of 3,000,000 pounds annually in this product.

X. Priorities

The question of priorities was discussed and the possibilities of a more formal list with serial numbers which would separate the various projects in respect to the laboratory equipment needed and personnel required. It was pointed out that such a system would require more paper work and it was the opinion of Messrs. Lanctot, Simpkins and House that such a system would not be justified. Priorities are fairly well taken care of under the present informal system. It was pointed out that there are always new projects coming up, some of which take priority over all other work, in which case the whole schedule would become obsolete. It was the consensus that the present handling of priorities was working out satisfactorily and that this scheme should be continued. Any members having projects in mind which they think should be given top priority were urged to communicate with interested parties to help arrange the necessary changes.

[fol. 5327] 1959 Budget

The 1959 Budget was discussed by Mr. Hartmann and he called attention to the addition of three $2,000 items to the previously prepared budget summary. These items are conduit, bus bar, and foil used for shielding. Mr. Hartmann explained that the work on bus bar would be work carried out by the Metallography Div. on the study of theory of electrical joints, while the other two projects were by the Chem. Met. Div. It was pointed out that Item 7-H-6 should be corrected to Electrical Tests of Bus Accessories. The budget was discussed at some length and especially the question of the cooperative EHV project with G.E. Mr. Tompkins raised the question if some of the items on the budget should not be joint projects with other aluminum producers, and Mr. Hartmann pointed out that this is under study but generally Alcoa likes to publish its own data on the properties of its products, and not depend on competitors' data. It was pointed out that the results

of the research work we report in our publications and papers brings great prestige to Alcoa, and Mr. Coffin expressed the opinion that this was a valuable sales aid and good advertising. It was pointed out that the Electrical Engineering Div. is one of the divisions of ARL whose work is most closely tied in with Sales. It was pointed out that the Budget is about 1% of electrical conductor sales. Mr. Tompkins made the motion that the budget be approved, seconded by Mr. Guess, and unanimously carried.

The meeting was adjourned at 2:45 P.M. on September 11.

CC to Messrs. E. G. Schoeffel, N. B. Lane & L. M. Arbegast, K. O. Cogger, T. L. Gilbert, J. A. Hagen, C. L. Kessler, J. S. MacKillican, G. E. Martin, R. W. Knapp—Pgh. Office.

[fol. 5329] Mr. T. L. Gilbert

Nov. 14, 1958
M-2520

Aluminum Company of America, Massena Fabricating

Purchase and Install Neoprene Extruding Equipment and Rehabilitate the Balance of Building 14 for Occupancy.

475,000	11-14-58
34,825	
440,175	HBL

[fol. 5330] This request is for funds to:

1. Purchase and install equipment for a continuous vulcanizing extruder line for rubber and neoprene insulating of aluminum conductors.
2. Revise the unclosed and unheated portion of Bldg. 14 to house this equipment and provide area for in-process material handling and storage.
3. Purchase and install test equipment in Bldg. 83 for in-process control of neoprene compound.

All of Alcoa's neoprene and rubber insulated conductors are presently being produced by Rome Cable Corporation under a toll arrangement. The facilities covered in this R/A would make possible the almost complete elimination of Rome Cable's services on our present line of covered conductors; i.e., line wire and service drop. At the same time, an annual savings of $165,000 to $190,000 would be realized, based on the 1957 sales of our neoprene products. Since the total required for the installation will be $475,000, contingencies included, the project would return the investmently in roughly 2.7 years. This savings is particularly important because all of it represents "out-of-pocket" money that the Company is spending at the 1957 level of business.

For our cost savings analysis, the following assumptions were made:

1. Neoprene scrap loss is figured at 15% Vs. actual 10% for current polyethylene scrap loss.
2. Using extruding techniques recently developed by DuPont, we should realize machine speeds from 2 to 2½ times those of Rome Cable's extruder speeds.

3. R&M for neoprene equipment is estimated to be 50% higher than the present plastic extruder line, partly due to the necessary high-pressure steam system.
4. Neoprene materials costs will amount to $.258 per lb., based on recent quotes from a custom compounder.
5. Rome costs were obtained from the most recent cost statements and represent the actual cost to Alcoa for the work performed by Rome Cable.

[fol. 5331] 6. Transportation savings would be the actual 1957 cost to Massena for shipment of conductor to and from Rome.

7. With the addition of the proposed equipment, burden rate on existing equipment would be modified to reflect better utilization of fixed expense and certain items of variable expense.

A number of favorable aspects that we see accruing to Alcoa from such an installation follow:

1. Customer acceptance of Alcoa neoprene products may be improved if manufactured by ourselves instead of by Rome Cable.
2. Rome Cable would be needed only for special constructions that amount to less than 1% of our present covered conductor sales.
3. Rome Cable would not be in as favorable a position to know Alcoa's covered conductor sales picture. Such information may be used to Alcoa's detriment at present.
4. Control of neoprene product quality within Alcoa's own organization would insure a higher level of quality.
5. More producing equipment, and thus more salable product, will give us better absorption of our Covered Conductor Dept. fixed expenses.
6. The new facilities would enable us to produce neoprene products at a rate of 3,000,000 pounds aluminum weight per year on a 15-shift operation.
7. We would be able to produce rubber-insulated high-voltage cables if required.

8. Traffic problems would be simplified, and deliveries could be bettered, especially in cases of combined bare and covered shipments.
9. Warehouse stocks of neoprene products could be considerably smaller than the present combined stocks at Rome and Massena.
10. Enclosing and lighting the balance of Bldg. 14 will eliminate a bad winter working condition, as we use the unheated portion of the building for in-process storage, and below-zero temperatures within the building are not uncommon.
11. Experience thus far will allow us to avoid many of the modifications that were costly R&M items during our first 18 months of operation of the present polyethylene line.
12. This proposed continuous vulcanizing line could readily be used for insulating with the new cross-linked type of polyethylene that gives promise of improved abrasion and heat resistance, as well as lower material costs.

[fol. 5332] It is estimated that the equipment would be in operation in 12 to 16 months from the approval of this R/A. At the 1957 neoprene product sales level, the equipment would be utilized 1.2 shifts per day.

[fol. 5333]

Summary	Estimated Cost Material	Labor	Burden	Total
Revisions to Bldg. 14	$ 76,700	$30,000	$16,300	$123,000
Substation & power distribution	20,800	3,400	2,100	26,300
Equipment including P.T. Lab. Equipment	234,325	32,375	16,425	283,125
Total	$331,825	$65,775	$34,825	$432,425

Re: Capital Expenditure Committee Meeting Notes
January 8, 1959

The following matters were discussed in the meeting noted above. Approval of all of the items noted below was recommended by the full Capital Expenditure Committee.

Detroit—CDV-669-R—Furnace Repair Revision—$4,500 revision. This revision covers an increased cost of repair to the furnace which was not foreseen until the repair job was well under way.

Franklin—NP-514—Extension of Rural Lines—$70,000. NP-513—Expansion of Service on Existing Lines—$220,000

These requests have to do with the Nantahala Power and Light Company's being able to extend service as the requirements of its customers demand. Approximately $250,000 each year has been spent since 1950. It is estimated that $107,000 income will be generated as a result of the service extension.

Lafayette—L-29972—14,000-Ton Press. Mr. Jones discussed with the committee the critical situation surrounding the need for the installation of the 14,000-Ton press at Lafayette. He strongly urged the release of approximately two million dollars to complete the installation. The committee will recommend this action to Mr. Haight.

Massena—M-2520—Neoprene Extruding Equipment—$475,000. Messrs. Coffin, Gilbert, and Knapp discussed this request, pointing out that savings of $165,000 to $190,000 annually would be realized by the purchase and installation of this equipment. It will completely eliminate toll fabrication of covered line and service drop wire which is now done by the Rome Cable Corp. Doing the work ourselves is felt necessary in order that we compete with Kaiser which owns U.S. Rubber and Kennecott which now owns Okonite. Mr. Knapp also pointed out that there will be another request for approximately $130,000 for twisting equipment to come should this request be approved. If this is not approved, the amount will be $200,000 since renovation of the building for the twisting equipment, now planned under M-2520, would still be necessary.

[fol. 5335] *Vernon*—CDLA-1405—Purchase of Two (2) 9" x 14" Roll Truing Machines—$33,160. The lack of capacity for roll truing soft alloy extrusions has been giving great difficulty in Vernon's meeting promises. In order to improve this situation and to prepare for acceptance of available additional business, the purchase of these two machines was requested. Savings of $49,700 will be made

by the elimination of current overtime, and the bottleneck of this operation will be eliminated.

Pittsburgh — P-2475 — Metallurgical Development Expense—1959—$319,000.

Pittsburgh—P-2487—Purchase N.C.R. Posting Machine—$4,978.60. This machine is needed in cashier's office for handling Imprest Fund accounts and will save hiring additional help.

Pittsburgh—P-2470—Investigate the Release of Thermal Distortion in Forgings—$7,500. This will continue experimental work in the release of thermal distortion and forgings of more complicated cross section.

T.I.S. Boak, Jr.

Re: Rome Cable Corporation

Here are a few thoughts and figures which may be helpful to you in discussing the possible acquisition of Rome Cable Corporation by Alcoa.

From almost any standpoint, the move would seem to be advantageous to Alcoa assuming, of course, that the cost was not too high. I can see the possibility, if not the probability, of some difficulties with respect to the handling of managerial personnel problems in both the Alcoa and Rome organizations, but I think that if the general matter of personnel is given careful consideration and percipient moves are made that everything should work out smoothly.

From other viewpoints I fail to uncover any angles that could not be taken rather easily in our stride. It seems to me that assuming that the physical plant could be acquired at a reasonable figure, by far the biggest other asset would be the acquisition of experienced personnel in that particular field of endeavor. Rudy Schatzel, of course, is considered to be one of the top men in the industry; and he has a number of younger men reporting to him who should be quite capable of carrying on after Rudy's retirement. In both operating and research, Rome happens to have very capable key men. So far as Rome's Sales Department is concerned, I think that we would have to give that particularly careful thought inasmuch as their method of distribution and direct selling differs considerably from ours.

[fol. 5337] Another very large asset which we would acquire would be that of almost complete participation in the

insulated conductor field in either aluminum or copper. In many cases, the so-called package deal is of extreme importance; and in many other cases, the mere prestige of carrying almost everything on the shelf makes a big impression on customers. If my memory serves me right, I think that Ross Fraser made the statement in front of you and me one time that if all wire sizes are included, their card index shows something like 300,000 items for which they have specifications on file. Rome Cable covers the entire field with the exception of the so-called high voltage, power cables which are in excess of 15,000 volts. I think Rome Cable has been smart in making that dividing line, and I think that we would be equally wise not to try to enter the high voltage field.

As I pointed out to you the other day, a study made by Anaconda Wire and Cable in cooperation with Alcoa indicates that at the present time EC aluminum has invaded the EC copper field only to the extent of 25 per cent. Granting that there are a number of fields which will probably remain in the copper camp until such time as copper might become virtually a precious metal, I think it is quite easy to visualize a reversal of the figures wherein aluminum will have invaded the copper field to the extent of some 75 or 80 per cent. I attach a photostat of product classifications taken from the Rome Cable catalog wherein the products have been check marked as to whether or not they would appear to be reasonable uses for aluminum. There are a number of uses such as magnet wire, the larger sizes of building wire, welding cable, power cable, etc., which I think could be spurred on at a much accelerated pace if we and the Rome people were working hand in hand. So far as covered conductors are concerned, I attach to this letter a chart show-
[fol. 5338] ing our progress since we entered the field. You will note that despite the set back in 1956 and 1957, which is chiefly attributed to lack of housing starts and a temporary retrenchment on the part of the utilities in distribution expenditures, the Alcoa trend is still upward. I have gathered from a few remarks here and there on the part of the Rome people that their volume is probably about the same as Alcoa's in aluminum covered conductors. It could be anticipated, therefore, that with the acquisition of the Rome Cable Plant our monthly shipment of aluminum covered

conductors and triplex would probably at least double and with a very satisfactory profit margin which would no longer have to be shared in part as a result of the acquisition.

Rome Cable's activities in steel conduit and their recent acquisition of the Cope Company would undoubtedly give us some additional outlets for Alcoa aluminum, but at the moment I have no way of evaluating those outlets.

From the standpoint of the Rome Cable stockholders, it seems to me that with the increasingly vicious competition which is found in the electrical conductor field the Rome stockholders would be far more secure if they were part of the Alcoa Organization. Just this past week Ross Fraser, as I explained to you, was certainly given an opportunity to see just how far the present price cutting campaign had gone; and at the moment there seems to be little relief in sight. Even granting the beautiful earning record of Rome Cable Corporation, it seems to me that those earnings would be very seriously jeopardized if Rome, due to the heavy competition in electrical conductors, would have to drop out of the picture and be content to deal only in copper. It appears at the moment that they may be exactly what some of the independent conductor people will have to do.

Philip T. Coffin.

PTC:ags

[fol. 5339] Product List

Today, Rome Cable offers to the purchaser of electrical wires and cables a well-rounded line of bare and insulated copper and aluminum conductors in sufficient variety of constructions to service adequately the requirements of practically any installation involving the transmission of electrical energy, both low and high voltage. Listed below are product types regularly manufactured. Our Engineering and Research Departments are ever ready, however, to study any special problem to the end of creating such cable design as will best serve your requirements.

Bare and Tinned Wires and Cables

Solid and Stranded (Copper and Aluminum), Round, Square, and Rectangular, ACSR

Weatherproof Wire and Cable
Copper and Aluminum

Braided-Type URC, RoLene (Polyethylene) Covered, RoPrene (Neoprene) Covered, Tree Wires

Magnet Wire

Cotton, Paper, Asbestos, Glass Covered.

Building Wires and Cables

Rubber and Braided, Rubber and Lead Covered, Rome Synthinol*, Thermoplastic Insulated, RoFlex Nonmetallic Sheathed, FlexAll* Thermoplastic Nonmetallic Sheathed.

Conduits

Rome—EMT, Rome—Rigid.

Radio and Instrument Wire

Rome Hi-Temp Rubber Insulated, Rome Synthinol*, Thermoplastic Insulated, Army-Navy Specification Types, RoTran Radio Frequency Transmission Lines, Balanced or Coaxial, Microphone Cables, Television Camera Cable.

---

*T. M. Reg.

Signal and Supervisory Cables

Flexible Cords

Rubber Insulated, Rome Synthinol* Thermoplastic Insulated.

Machine Tool and Control Wires

Rome Synthinol* Thermoplastic Insulated.

Heavy-Duty Cords

Rubber Sheathed, Rome 60* Neoprene Sheathed, Rome Synthinol* Thermoplastic Sheathed.

Heavy-Duty Portable Cables

Rome 60* Neoprene Sheathed, Mining, Welding, Power (Types W and G), Shovel Power—Type SH, Diesel Electric Locomotive Cable.

Power and Control Cables

RoPrene (Neoprene) Sheathed, RoSeal (Thermoplastic) Sheathed, Rubber Insulated and Lead Covered, Rome Synthinol* Thermoplastic Insulated, RoLene (Polyethylene) Insulated, RoMarine-RoPrene Low-voltage Distribution, RoZone* Insulated High-voltage Distribution, RoZone A Insulated High-voltage Distribution, Series Street Lighting, Self-supporting Aerial.

Service Drop and Service Entrance Cables—Copper and Aluminum.

Specify Rome Cable.... It Is Your Assurance of Dependable Quality.

Re: Rome Wire and Cable Company

Ralph Davies and I were at Rome yesterday and met with Messrs. H. T. Dyett and J. H. Dyett and A. D. R. Fraser. We had lunch with the following officers, who are also members of their Board of Directors:

H. W. Barnard
H. T. Dyett
J. H. Dyett
C. H. Ellis
A. D. R. Fraser
G. E. Rolston
R. A. Schatzel
F. S. Marks

Most of the talking on Rome's side was done by Mr. H. T. Dyett and Mr. Fraser. The atmosphere was most friendly all the time.

The reasons for any possible interest we might have in the Rome Wire and Cable Company were discussed in some detail. This was rather important because it laid the ground work for a further discussion and impressed on them the importance of Alcoa's further development in the insulated aluminum wire and cable business.

Mr. Dyett described the development of the Rome Wire and Cable Company and his anxiety to maintain the fine organization for which he felt responsibility. As you know, he took with him a number of important people from the General Cable Company when he formed the Rome Com-

[fol. 5341] pany. Mr. Davies and I described as best we could how we believe his organization and facilities could best be operated on a divisional status if a merger should be consummated. We pointed out that many details would have to be covered in the event of further discussions, but that, generally speaking, we felt the production and marketing of various types of aluminum and copper electrical conductors might best be handled on a divisional basis with, of course, the natural coordination that would be necessary with respect to policies and practices of the parent company. We pointed out that only experience could develop the best working arrangement. For example, it seemed quite logical that as time went on our electrical conductor marketing organization might best be combined with that of the Rome Division, even though Alcoa's present Fabricating Division might well continue to be the production unit for our present products or even some added electrical conductor products. We did emphasize that there was every evidence that the Rome organization and its experience could be fully utilized in the event of a merger. This type of approach to the problem seemed to be acceptable to Mr. Dyett.

There ensued considerable discussion about the present competitive situation on both aluminum and copper electrical conductors, and there was evidence that the Rome people recognized the growing importance of integration of metal production and electrical conductor fabrication. Tax considerations of divisional operations as against subsidiary companies seemed also to be thoroughly understood. They have the same problem with two small diversified divisions.

The recent DuPont decision was raised and Mr. Davies gave them Mr. Hickman's latest opinion. They empha-
[fol. 5342] sized this by pointing out that their business in bare A.C.S.R. was of a very minor nature.

Mr. Dyett suggested that, without getting into details, he would be curious to know whether we had discussed methods of accomplishing a merger. We said that we had discussed the matter only with you and again in generalities, and one of the ideas we had discussed was an exchange of stock. He and Mr. Fraser then indicated that if we felt we needed information additional to that in their annual

statement and in their SEC reports, they would be glad to give us whatever we asked for. However, they indicated that they believed there was sufficient in these reports for us to come to our own conclusions as to what we might wish to put as a value on their company. It was pretty obvious to Ralph and me that they were building a pretty good case for a substantially higher figure than would be indicated by the book value. For example, Mr. Dyett pointed out that some years back, when Bill Price tried to buy their company, the offer was so ridiculously low that about all he could do was fold up his papers and bid them a pleasant goodbye. They both pointed out, however, that Westinghouse and Rome have been very close friends through all the years. In any event, we got very little of any definite nature as to what they might consider as an acceptable valuation.

Finally, Mr. Dyett said he would like to give the matter further consideration and hoped that we would return to Pittsburgh and do the same. He said that in the course of a few days he would phone Ralph and let him know whether or not they were at all interested in a further discussion on the subject.

Ralph's and my conclusions are that Mr. Dyett is definitely interested, but at terms and conditions that might [fol. 5343] be pretty difficult for us to swallow.

Re: Rome Cable Corporation

Please consider this letter as a partial reply to your letter of August 9 having to do with the legality of Alcoa's possible acquisition of Rome Cable Corporation. Mr. F. L. Magee had written me more briefly on the same subject on August 6. Accordingly, I am sending copies of this letter to both Mr. Magee and Mr. Davies, and also to Mr. Wilmot.

I hope to have considerably more information on your numbered paragraphs 1, 4, 5 and 7 by Friday the 16th. That additional information is being gathered for me by Rome Cable Corporation.

In order to meet your deadline of August 14, I have already gathered the following information in answer to your nine numbered paragraphs. The numbered quotations are yours.

1. "I assume Rome purchases pig from Alcoa. If so, what is the dollar amount of such purchases? If it purchases from others, what percentage of Rome's requirements does Alcoa supply?"

Rome purchases EC pig from Alcoa as well as from others. The dollar value purchased from Alcoa was approximately $1,096,000 in 1956 and $233,000 to date in 1957. The salesman handling the account believes that Alcoa receives about two-thirds of Rome's EC pig purchases. It is believed that the balance is divided between Kaiser and Alcan. Rome gave all its pig business to Alcoa from about 1953 to 1956, but commenced dividing the business at Alcoa's suggestion when a severe metal shortage began to develop.

[fol. 5345] 2. "If we sell Rome any other materials such as redraw rod, wire, etc., what is the approximate dollar value of those sales, and what percentage of Rome's total requirements for such products does Alcoa supply?"

Rome purchases a very small miscellany of Alcoa products other than pig. In 1956 the aggregate value of purchases of such products—EC wire, bare cable, covered conductors, cable accessories, foil and chemical products was less than $3,000.00. In 1957 to date it is less than $1500.00. It is believed that Rome purchases virtually all such requirements from Alcoa.

3. "List the products which Rome sells and indicate those which Alcoa also sells."

The following summary of Rome's products is copied from Dun and Bradstreet's July 3, 1957 report. The individual items of course run into the thousands. The products underlined are also sold by Alcoa:

Copper: Manufactures rolled rods, bare and tinned wires and cables, magnet wire, weatherproof wire and cables, rubber insulated building wire, rubber insulated flexible cords, neoprene sheathed heavy duty rods and cables, control cables, low voltage power cables, high voltage power cables, service drop and service entrance cables, miscellaneous rubber insulated wire and cables, thermoplastic insulated building wire, thermoplastic insulated flexible cords and thermoplastic insulated instrument and radio wire (S C 3392-3631). Aluminum: *Rolled rods, bare wire and cables,* magnet wire, *weatherproof wires* and *cables,* insulated power cables, and *self-supporting service drop cables.* (SIC 3352-3392).

Steel: Electrical metallic tubing, rigid conduit, conduit [fol. 5346] fittings, television mast tubing and commercial tubing (Sic 3611). Under new T.S. Cope Division, manufactures cable trays, racks and troughs and accessories for the installation of cable. Direct defense contracts are small. Many of the products manufactured are used in defense industries, either directly or indirectly.

Although you do not ask the question, it is perhaps of importance to bear in mind that Alcoa manufactures most of the weatherproof wire and cable as well as service drop

in thermoplastic coverings, only. It *sells*, however, rubber and synthetic rubber coverings applied to its bare wires and cables by Rome on a toll basis. Up to less than a year ago Rome also applied the thermoplastic coverings for Alcoa.

4. "Give as well as you can Rome's percentage of the market in each product which it sells, and to the extent that Alcoa sells the same products show Alcoa's percentage of the market."

I have no really constructive reply to this question at the moment. I have the impression that Rome is probably an overall factor of perhaps ten percent in its overall field of endeavor. It enjoys an excellent reputation and in some products is doubtless a much larger factor. It limits its field in high voltage cable (very wisely, I think) to not over 15,000 volts.

In the area where Rome and Alcoa are competitive, I must again resort to considerable guesswork. So far as aluminum weatherproof (covered) conductors and service drop are concerned, the BDSA (Department of Commerce) figures indicate that Alcoa is about a ten percent factor. My guess is that Rome is a smaller factor than Alcoa in this field—say 5 to 7½ percent. Alcoa is currently about a one-third factor in bare conductors. Up to the present [fol. 5347] Rome has only occasionally shown itself in this field and can hardly be considered a factor.

5. "Describe the method by which Rome distributes its product. If it sells through distributors or jobbers, do any of them also handle Alcoa's products or the products of any other manufacturers?"

I do not have much concrete information on Rome's selling outlets. We do know that they have some thirty-five to forty salesmen—about the same number as Alcoa has on conductors—and that they have fifteen sales offices and six warehouses located at:

Sales Offices		Warehouses
Atlanta, Ga.	New York City, N. Y.	Chicago, Ill.
Boston, Mass.	Philadelphia, Pa.	Dallas, Tex.
Chicago, Ill.	Pittsburgh, Pa.	Los Angeles, Calif.
Cleveland, Ohio	Salt Lake City, Utah	San Francisco, Calif.
Dallas, Tex.	San Francisco, Calif.	Seattle, Wash.
Detroit, Mich.	Seattle, Wash.	Torrance, Calif.
Houston, Tex.	Torrance, Calif.	
Los Angeles, Calif.		

We know that they have quite a number of distributors, but I shall have to await further particulars.

6. "How many companies are engaged in selling the products which are sold by Rome at the same distribution level at which Rome sells?"

I understand this question to inquire, in effect, how many manufacturing competitors Rome may have. The answer [fol. 5348] will vary a great deal, depending on the product. For many of the copper products such as building wire, lamp or appliance cords, and many other products sold across the counter, the number of manufacturers might well be 50 to 100 or more. Probably not over one out of ten of these dabble in aluminum. Manufacturers of covered or weatherproof wire and cable, and service drops probably number about 35 to 40, and most of them dabble in aluminum, and certainly about 15 of them are very competitive factors. Of these, Kaiser is the biggest. About twelve companies regularly compete in the bare aluminum conductor field, and another eight or ten who do not handle aluminum compete with Rome in bare copper products, such as trolley wire, rail bond cable, etc.

7. "What has been the history within approximately the last five years of any mergers or acquisitions of one company by another in this industry?"

I do not have much information as yet on this question other than what I remember. My recollection is that probably a dozen mergers or acquisitions have taken place during the 1950-1957 period. The Kaiser-U.S. Rubber deal and the Olin-Mathieson-Southern Electric combination seem to have been the most "industry rocking" announcements, and certainly the most threatening to Alcoa's position.

8. "Would the acquisition of Rome aid Alcoa in competition with other cable producers?"

My answer to this question is a most emphatic "Yes". Alcoa, through many years of experience in the bare conductor field, long since became and continues to be a leading factor in aluminum. Until rather recently its competi- [fol. 5349] tion—domestically at least—was almost entirely with bare copper conductors. In the last decade Alcoa's

bare conductor competition has changed almost entirely to aluminum. This phenomenon in itself was not unexpected, but it introduced a new competitive phase which can well put Alcoa "on the ropes" in the broad electrical conductor field unless prompt steps are taken to head off the threat. The steps in cause and effect are quite simple:

A. As the spread between copper and aluminum prices became more and more favorable to aluminum one copper conductor manufacturer after another assumed the dual role of a producer of either class of product.

B. Copper had been the accepted standard since the birth of the electrical industry for all electric conductor purposes, and until the era of definite aluminum price superiority arrived never was seriously challenged in the many fields of electric conductors other than bare transmission.

C. Copper conductor manufacturers with the "know how" in the fields of manufacture, research, technology, competitive tricks or gimmicks and distribution, introduced aluminum into new areas of electric conductors—covered or weatherproof conductors, power cables, welding cables, etc. They and the aluminum people are probing in many other areas.

D. The "dual rolers" are in a most strategic position to exploit existing copper uses for aluminum, and to take advantage of that great gimmick knows as the "package deal", wherein a customer requiring certain aluminum as well as copper requirements is given a bargain by placing orders for both at the same time.

E. The "package deal" and the possession of "know [fol. 5350] how" have already lead two integrated aluminum producers to acquire "dual rolers"; Kaiser bought out the conductor division of U.S. Rubber, and Olin-Mathieson bought out Southern Electrical Corporation. Rumors have been rife for months that Reynolds is looking around for a similar buy. Anaconda Wire and Cable is now, of course, in every practical sense, a double integrated "dual roler".

F. Rome Cable, with its fine personal and in general excellent "know-how", is by far the best acquisition, in my opinion, that Alcoa could hope to find. The step would be the answer to the present Kaiser threat to push Alcoa out of first place in the electrical conductor field. Kaiser re-

cently took Baltimore Gas and Electric Company's 1958 requirements through the medium of an aluminum-copper "package".

9. "If Rome is engaged in the manufacture and sale of products which Alcoa does not manufacture and sell, what problems would Alcoa encounter in getting into that business if it did not acquire Rome?"

The answer to this question, I believe, is largely reflected in my effort to reply to #8. Instead of acquiring a going concern in every sense of the word—plant, personnel, goodwill and "know-how"—all in one move, Alcoa would be faced with attempting to pick up all kinds of information and technical "know-how" in particular. A large part of the physical plant and equipment would take at least two years to complete, and I question very seriously whether Alcoa could acquire piecemeal "know-how" to be fully competitive within less than five to ten years; even this statement may be conservative, for certainly our competitors would not be standing still while we were trying to catch up. It may be just a simple matter of whether or not we decide that the present opportunity is too risky—finan- [fol. 5351] cially, legally, or both. From what we can gather statistically, it appears that aluminum today has invaded electric current carrying uses of copper to the extent of about 25%. I believe that aluminum has at least another 50% natural invasion to exploit.
